Brewer Diagnostic Kits

Complete Serological Screening Tests For Syphilis . . .

The RPR Card Tests make use of a specially prepared, carbon-containing RPR Card antigen. The particle size and other characteristics of the carbon is such that when a reactive specimen is encountered, flocculation occurs, and there is a coagglutination which is readily visible to the naked eye. Individual tests, including the collection of blood and separation of plasma can be performed in 7 to 8 minutes.

Confirming earlier findings with the RPR Card Test[1-10] Reed[11] in reporting on 63,800 specimens had an overall agreement of 98.5% in a recent comparative study with other routine screening procedures.

The RPR Card Tests, with their low cost, ease of performance, high sensitivity and specificity, are without peer in situations that demand rapid testing of patients, enabling the physician to initiate prompt treatment of early infectious syphilis.

Specify the RPR Card Test as the screening procedure on serum or plasma samples submitted to your State Approved Laboratory.

RPR CARD TESTS

FOR SYPHILIS AND OTHER TREPONEMATOSES

HYNSON, WESTCOTT & DUNNING, INC.

Baltimore, Maryland 21201 HW&D

When the stagnant sinus must be drained...

Transillumination of the sinuses – diffuse shadow on right side of face indicates unilateral maxillary sinusitis.

In the common cold, Neo-Synephrine is unsurpassed for reducing nasal turgescence. It stops the stuffy feeling at once. It opens sinus ostia to re-establish drainage and lessen the chance of sinusitis. With Neo-Synephrine, in the concentrations most commonly used, decongestion lasts long enough for extended breathing comfort, without endangering delicate respiratory tissue. Systemic side effects are virtually unknown. There is little rebound tendency.

Neo-Synephrine® HCl

Brand of phenylephrine hydrochloride

is available in a variety of forms, for all ages:

- ⅛% solution for infants
- ¼% solution for children and adults
- ¼% pediatric nasal spray for children
- ½% solution for adults
- ½% nasal spray for adults
- ½% jelly for children and adults
- 1% solution for adults (resistant cases)

Also NTZ® Solution or Spray
Antihistamine-decongestant

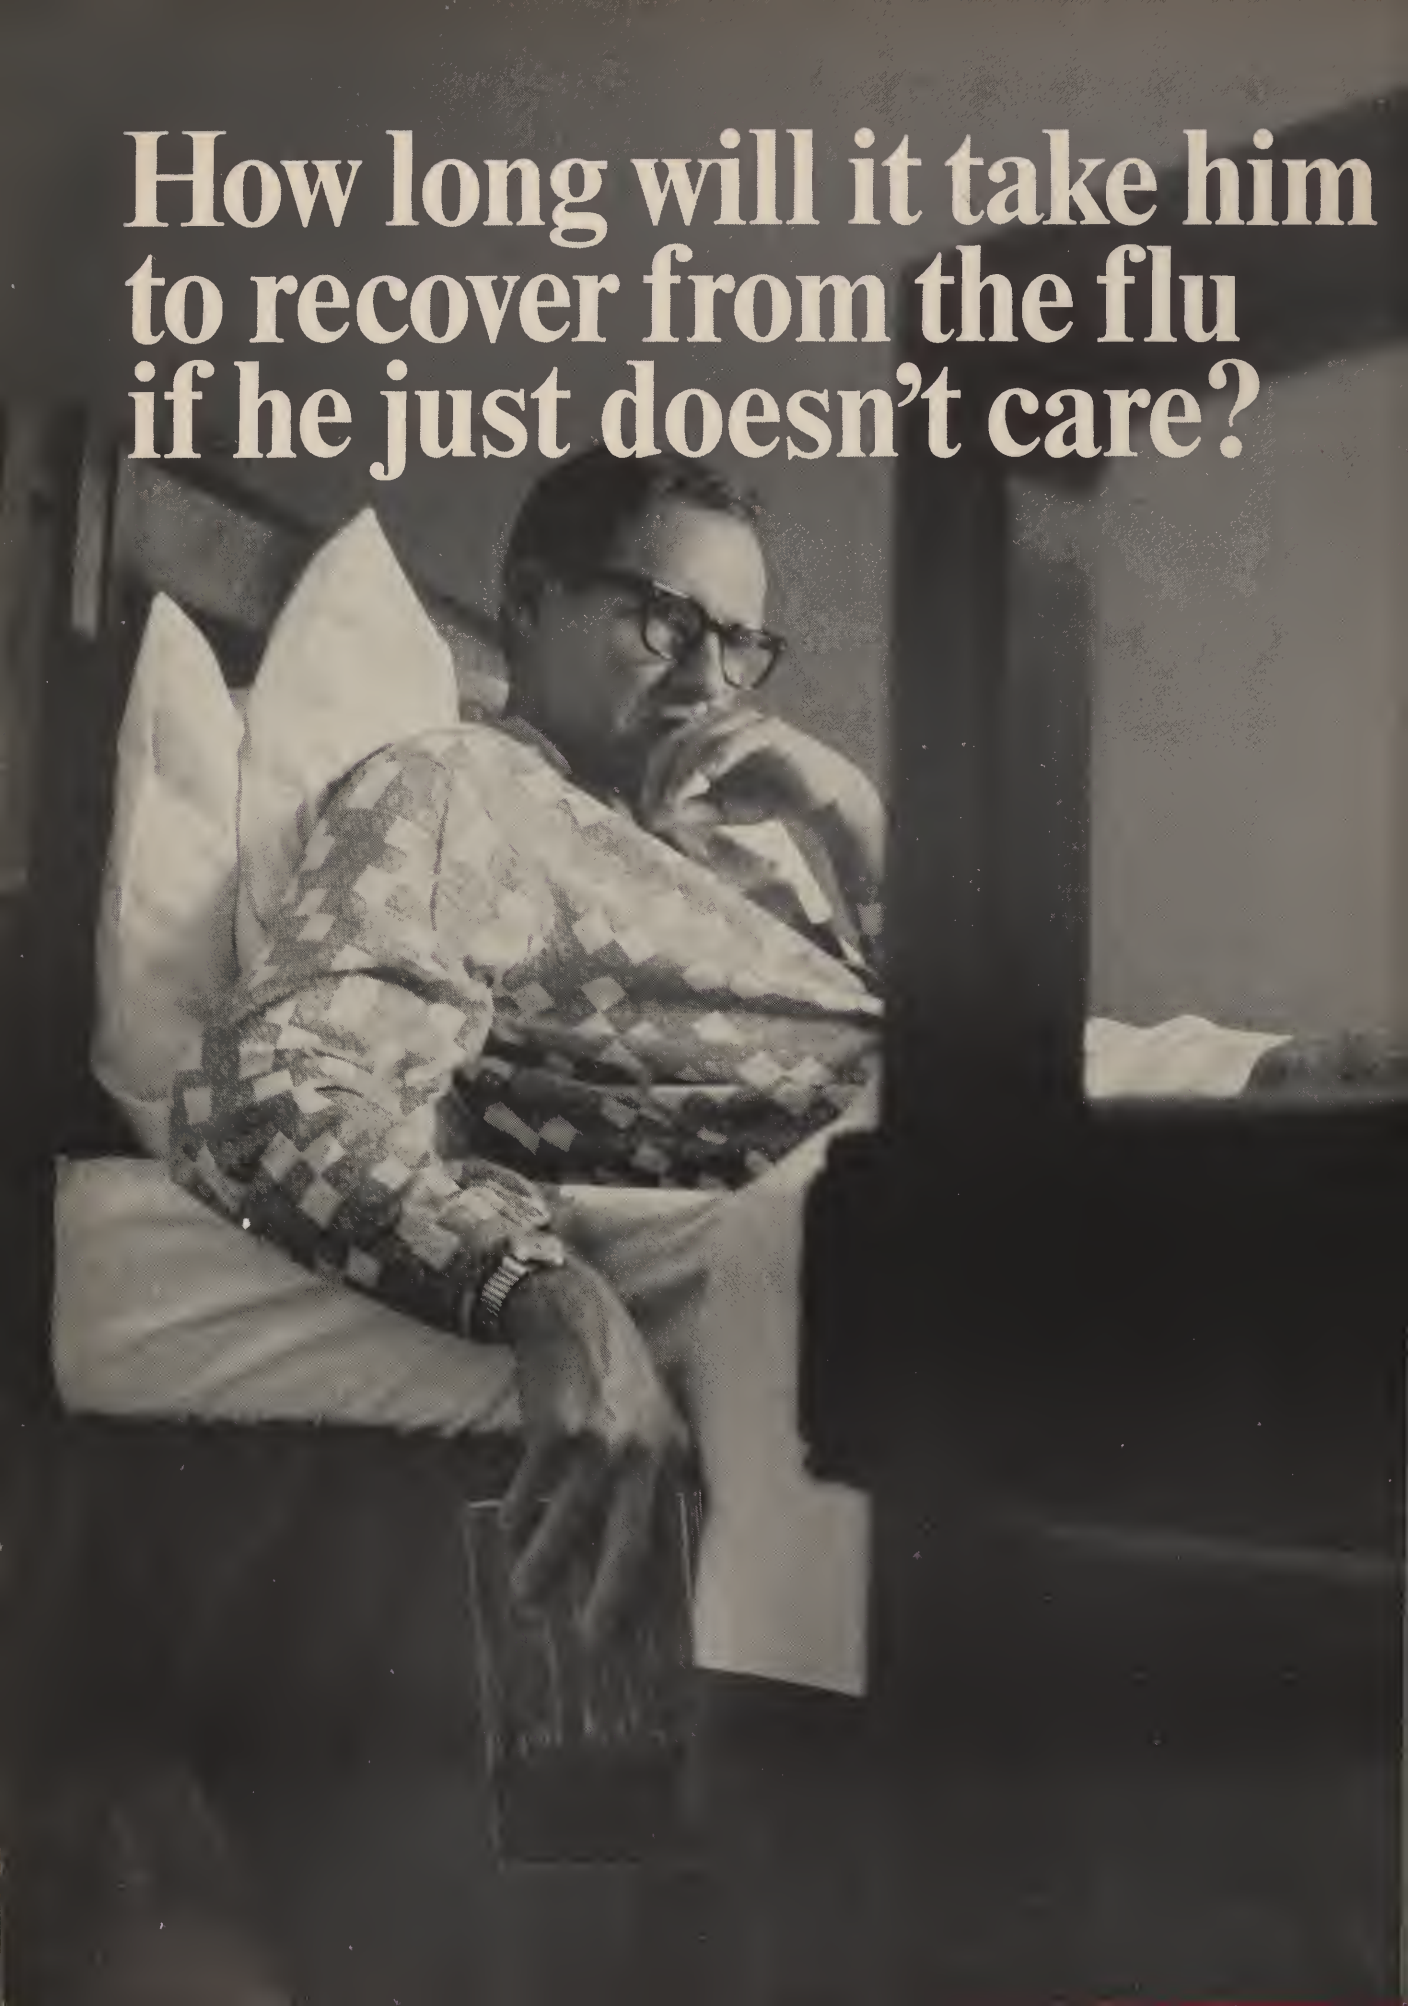
The Keogh Plan: The New Amendment 131

3 a.m.
Sleep-interfering
anxiety and tension
can usually be relieved
with
EQUANIL®
(meprobamate) Wyeth



Cautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use may result in dependence or habituation in susceptible persons—as ex-addicts, alcoholics, severe psychoneurotics. After prolonged high dosage, drug should be withdrawn gradually to avoid possibly severe withdrawal reactions including epileptiform seizures. Side effects include drowsiness and, rarely, allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute non-thrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever have been reported. Meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Warn patients of possible reduced alcohol tolerance. Should drowsiness, ataxia, or visual disturbances occur, dose should be reduced. If symptoms persist, patients should not operate vehicles or dangerous machinery. A few cases of leukopenia, usually transient, have been reported following prolonged dosage. Other blood dyscrasias—aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia—have occurred rarely, almost always in the presence of known toxic agents. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. Prescribe very cautiously for patients with suicidal tendencies. Suicidal attempts should be treated with immediate gastric lavage and appropriate supportive therapy.

Contraindications: History of sensitivity to meprobamate.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

Wyeth Laboratories
Philadelphia, Pa.

Wyeth®
SERVICE TO MEDICINE

How long will it take him
to recover from the flu
if he just doesn't care?

Does he really care? Is he alert, encouraged, positive and optimistic about getting out of bed and back to work soon?

Or is he giving in to the depressing impact of confinement?

When functional fatigue complicates convalescence, Alertonic can help...

Pleasant-tasting Alertonic is pipradrol hydrochloride—an effective cerebral stimulant whose gentle analeptic action helps counteract the apathy and inertia that so often delay convalescence—together with an excellent vitamin and mineral formula, in a satisfying 15% alcohol vehicle.

Nothing fosters confidence and a sense of well-being better than your own personal warmth, understanding and encouragement together with Alertonic to help insure prompt response.

Adequate dosage is important: Prescribe Alertonic—one tablespoonful t.i.d., 30 minutes before meals...tastes best chilled.

And for your patient's sake, prescribe Alertonic in the convenient, economical one-pint bottle.

Alertonic®

Available Only On Prescription

Each 45 cc. (3 tablespoonfuls) contains: alcohol, 15%; pipradrol hydrochloride, 2 mg.; thiamine hydrochloride (vitamin B_1) (10 MDR*), 10 mg.; riboflavin (vitamin B_2) (4 MDR), 5 mg.; pyridoxine hydrochloride (vitamin B_6), 1 mg.; niacinamide (5 MDR), 50 mg.; choline,† 100 mg.; inositol,† 100 mg.; calcium glycerophosphate, 100 mg. (supplies 2% MDR for calcium and for phosphorus) and 1 mg. each of the following: cobalt (as chloride), manganese (as sulfate), magnesium (as acetate), zinc (as acetate), and molybdenum (as ammonium molybdate).

*Multiple of adult Minimum Daily Requirement supplied.
†The need for these substances in human nutrition has not been established.

Indications: 1. Functional fatigue such as that often associated with: a depressing life experience or stressful time of life; advancing years; convalescence; limited activity or confinement. 2. Poor appetite and vitamin-mineral deficiency as they occur in: patients having faulty eating habits; geriatric patients who are losing interest in food; patients convalescing from debilitating illness or surgery.

Contraindications: As with other drugs with CNS stimulating action, Alertonic is contraindicated in hyperactive, agitated or severely anxious patients and in chorea or obsessive compulsive states.

Side effects: Reports of overstimulation have been rare. Patients who are known to be unduly sensitive to the effects of stimulant drugs should be observed carefully in the initial stages of treatment.

Dosage: Adults, 1 tablespoonful; children (over 15 years old), 1 to 2 teaspoonfuls; children (4 to 15 years old), 1 teaspoonful. To be taken three times daily 30 minutes before meals.

Postgraduate Courses

CLINICAL ANATOMY

Feb. 1 through May 24 $150.00
(3 hours/day; 2 days/week)

Under the direction of Frank H. J. Figge, MD, and Otto C. Brantigan, MD

Emphasizing the practical application of anatomy and anatomical principles in physical and x-ray diagnosis. Anatomical knowledge is related to the use of needling in performing diagnostic procedures and in treatment. The course is directed toward both the medical man and the surgeon. It is an aid in preparation for the American Board Examination.

GYNECOLOGY

February 9, Fee $15.00

Under the direction of Edmund Middleton, MD
Designed to be of interest to the general practitioner and/or the specialist.

DIABETES

March 2, Fee $15.00

Under the direction of Charles E. Shaw, MD and THOMAS B. CONNOR, MD

Presenting recent advances of great practical interest in this field.

HEMATOLOGY

March 16, Fee $15.00

Under direction of Carroll L. Spurling, MD

A review of current trends and investigative efforts in selected areas of hematology and their implications, both practical and theoretical.

IN-SERVICE PROGRAM

$25.00

The enrollee spends a week in pre-selected department, accompanying members of the department on Rounds, Conferences, Clinics, etc. Time is arranged upon application. This course will not be available during the months of May, June, July.

For information, write: Committee on Postgraduate Education, University of Maryland School of Medicine, 522 W. Lombard St., Baltimore, Md. 21201.

GENETICS IN MEDICAL PRACTICE

January 26-27

A two-day seminar at Howard University College of Medicine, Washington, DC.

No registration fee

Question and answer period

For further information, see Classified Advertising, p. 150

AMERICAN COLLEGE OF PHYSICIANS POSTGRADUATE COURSES

The following courses are made possible by the generous cooperation of the directors and institutions involved. Tuition fees: Members, $60.00; Nonmembers, $100. Registration forms and requests for information are to be directed to: Edward C. Rosenow, Jr., MD, FACP, Executive Director, American College of Physicians, 4200 Pine Street, Philadelphia, Pa. 19104

FEBRUARY 6-10

Biochemical Mechanisms in Internal Medicine

Washington University School of Medicine, St. Louis, Mo; Carl V. Moore, MD, FACP; Sol Sherry, MD, FACP; and William Daughaday, MD, co-directors

FEBRUARY 27-MARCH 3

Arthritis and Related Disorders

New York University Medical Center, New York, NY; Currier McEwen, MD, FACP, and Edward F. Hartung, MD, co-directors.

MARCH 6-10

Recent Advances in Cardiovascular Disease

The Mount Sinai Medical Center, New York, NY; Charles K. Friedberg, MD, FACP, director.

MARCH 13-17

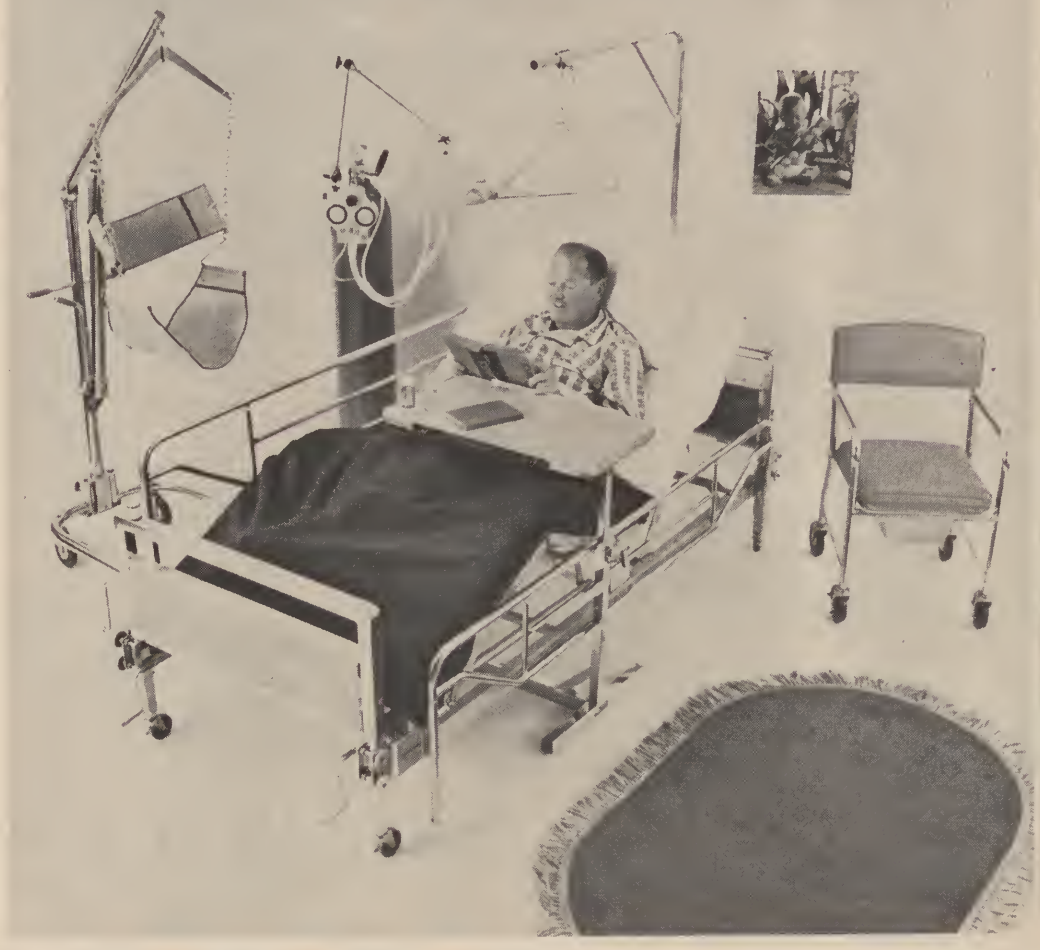
Physiological Aspects of Cardiopulmonary Disease

Yale University—New Haven Medical Centers, New Haven, Conn; Frank D. Gray, MD, FACP director; Donald F. Egan, MD, co-director.

MARCH 20-24

Fundamental Concepts of Gastroenterology

University of Michigan Medical Center, Ann Arbor, Mich; H. M. Pollard, MD, FACP, director.



MARCH 27-31

Psychiatry for the Internist

Wayne State University School of Medicine (Lafayette Clinic), Detroit, Mich; Paul Lowinger, MD, director; Victor Bloom, MD, co-director.

(Continued)

A complete hospital room at home is now available under MEDICARE and LOCAL AID

All your patient need do is call Abbey for any item on your verbal or written authorization. Abbey completely processes all MEDICARE and LOCAL AID equipment claims, including hospital beds, wheelchairs, traction and oxygen equipment, crutches, walkers, commodes, lamps, whirlpools, and all other authorized items. We have 42 years of experience behind us to fit the equipment to the patient's precise needs. Professional service 24 hours a day every day, with prompt delivery by trained technicians.

EXECUTIVE SECRETARY'S NEWSLETTER

January, 1967

DUES BILLS IN MAIL

1967 dues bills have been mailed to all physicians throughout the State. If you have not received your bill, due to mail difficulties, let us know.

All physicians are reminded that Legal Defense is not available unless dues are paid before January 31, 1967.

ANNUAL MEETING RESOLUTIONS

Resolutions for consideration at the Faculty's Annual Meeting should be received in the Faculty office by:

WEDNESDAY, FEBRUARY 22, 1967

The Reference Committee will meet to consider the resolutions received on Wednesday, March 29, 1967, at 8:00 p.m., in the Faculty Building, 1211 Cathedral Street, Baltimore.

SUPERFERTILITY STUDY

The Clinical Center, National Institutes of Health, is conducting a Superfertility Study. Patients who have delivered spontaneously more than one set of twins, triplets, or other multiple births, are needed for the study.

Interested physicians should contact the Faculty office.

FACULTY PRESIDENT HONORED

The Faculty President, J. Morris Reese, M.D., has been honored by the University of Maryland for his 42 years as a teacher in the School of Medicine. He was named Professor Emeritus of Obstetrics and Gynecology, effective December 1, 1966.

NEWS NOTES

Robert C. Kimberly, M.D., Baltimore, has been named President-elect of the Society of Medical Consultants of the Armed Forces.

E. H. Silverstein, M.D., has announced the opening of his offices for the practice of Dermatology at the Mt. Vernon Medical Building and the Milford Medical Building.

New Active members of the American Society of Anesthesiology include: Drs. Manuel J. Balseiro, Silver Spring; Gus E. Cezeauz, Jr., Wheaton; Alison B. Wilhelm, Cheverly; Anthony R. Boccuti, Baltimore; and Pedro M. Pabon, Camp Springs.

New Junior Members are: Drs. Helmut F. Cascorbi, Ellen A. Millan, Mohammed A. Shakoor, Jose C. Arroyo, and Nelson J. Realo, all of Baltimore.

Maher W. Ishak, M.D., Havre de Grace, is a new Diplomate of the American Board of Surgery.

H. L. Wollenweber, M.D. has announced the association of James B. T. Foster, M.D., in the practice of Pathology.

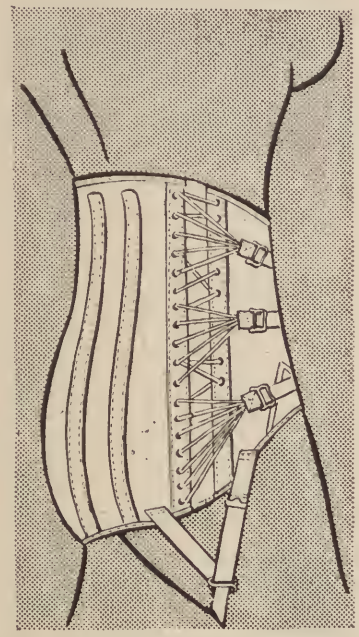
RULES AND REGULATIONS WITH WHICH PHYSICIANS MUST COMPLY

A complete compendium of Rules and Regulations with which Physicians in Maryland must comply is now available to Faculty members. Initial copies have been included with the first issue of The Assemblyman. Additional copies are available while the supply lasts.

For complete details in connection with the "capsule" opinions rendered in this booklet, the appropriate law or regulation should be consulted.

If you did not receive your copy, won't you let the Faculty office know?

BILLING ON MEDICAL CARE PATIENTS



The State Health Department advises that some physicians are not billing for medical care patients at the usual, customary or reasonable fees as recommended by the House of Delegates at the Ocean City meeting this year.

The Commissioner has requested this be brought to the attention of all members so they may comply with the ruling of the House of Delegates. Payments will be made at the current schedule, but this additional information will assist the Health Department in its collection of data for payments when sufficient funds are appropriated for implementation of the usual, customary or reasonable concept.

Serving the Medical Profession for Almost Half a Century

Special Low-Rate **LOANS for DOCTORS**

Mercantile makes special loans of up to $25,000 to Doctors

. . . TO PROVIDE WORKING CAPITAL

. . . TO PURCHASE EQUIPMENT

. . . TO FURNISH YOUR OFFICE

With our exclusive *Doctors Loan Plan,* it is possible for both established physicians and recent graduates to borrow up to $25,000 for a seven-year period at a very favorable interest rate. For recent graduates, the first payment is not due until six months after the date of the loan. Life insurance up to $10,000 will be included in your loan plan, and arrangements can be made for additional insurance coverage, if desired.

A Mercantile Doctors Loan may be the means you need to take an important step forward in your career. For complete information, call either 539-1040 or 823-7400 and ask for our Doctors Loan Department.

Norinyl® tablets
(norethindrone 2 mg. & mestranol 0.1 mg.)

for multiple contraceptive action that has produced a record of unexcelled effectiveness

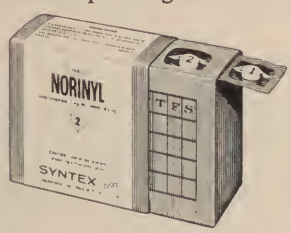
inhibition of ovulation by means of 2 time-proved hormonal agents

production of a cervical mucus hostile to sperm motility and vitality

creation of an endometrium unreceptive to egg implantation

no unplanned pregnancies

Norinyl provides multiple action for maximum assurance of success. It does not depend on ovulation inhibition alone for contraceptive effectiveness. The mechanism of action of combined hormonal therapy results in ovulation inhibition reinforced by other protective mechanisms, including a hostile cervical mucus[1-13] and an acceleration of endometrial changes.[1-3,7-16] With Norinyl, no unplanned pregnancies have been reported to date when used as directed.



plus important supportive benefits that help her through those critical early months of oral contraception

low incidence of side effects

Low incidence of BTB and spotting, nausea and amenorrhea tends to minimize side effect problems and increases patient cooperation.

no confusion about dosage

An unbreakable "confusionproof" package makes it easy to adhere to prescribed dosage schedule: individually sealed tablets numbered from 1 through 20 *plus* monthly calendar record enables patient to double-check dosage intake by day and corresponding tablet number.

Contraindications: Thrombophlebitis or pulmonary embolism (current or past). Existing evidence does not support a causal relationship between use of Norinyl and development of thromboembolism. While a study which was conducted does not resolve definitively the possible etiologic relationship between progestational agents and intravascular clotting, it tends to confirm the findings of the Ad Hoc Advisory Committee appointed by the Food and Drug Administration to review this possibility. Cardiac, renal or hepatic dysfunction. Carcinoma of the breast or genital tract. Patients with a history of psychic depression should be carefully studied and the drug discontinued if depression recurs to marked degree. Patients with a history of cerebral vascular accident.

Warning: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn.

Precautions: By May 1963, experience with norethindrone 2 mg.—mestranol 0.1 mg. had extended over 24 months. Through miscalculation, omission or error in taking the recommended dosage of Norinyl, pregnancy may result. If regular menses fail to appear and treatment schedule has not been adhered to, or if patient misses two menstrual periods, possibility of pregnancy should be resolved before resuming Norinyl. If pregnancy is established, Norinyl should be discontinued during period of gestation since virilization of the female fetus has been reported with oral use of progestational agents or estrogen. When lactation is desired, withhold Norinyl until nursing needs are established. Existing uterine fibroids may increase in size. In metabolic or endocrine disorders, careful clinical preevaluation is indicated. A few patients without evidence of hyperthyroidism had elevated serum protein-bound iodine levels, which in the light of present knowledge, does not necessarily imply hyperthyroidism. Protein-bound iodine increased following estrogen administration. Bromsulphalein retention has occurred in up to 25% of patients without evidence of hepatic dysfunction. Studies from 24-hour urine collections have shown an increase in aldosterone and 17-ketosteroids and decrease in 17-hydroxycorticoid levels. Thus, Norinyl should be discontinued prior to and during thyroid, liver or adrenal function tests. Because progestational agents may cause fluid retention, conditions such as epilepsy, migraine and asthma require careful observation. Thus far no deleterious effect on pituitary, ovarian or adrenal function has been noted; however, long-range possible effect on these and other organs must await more prolonged observation. Norinyl should be used with caution in patients with bone, renal or any disease involving calcium or phosphorus metabolism.

Side Effects: Intermenstrual bleeding; amenorrhea; symptoms resembling early pregnancy, such as nausea, breast engorgement or enlargement, chloasma and minor degree of fluid retention (if these should occur and patient has not strictly adhered to medication plan, she should be tested for pregnancy); weight gain; subjective complaints such as headache, dizziness, nervousness, irritability; in a few patients libido was increased. In a total of 3,090 patients, 2.2% discontinued medication because of nausea.

NOTE: See sections on contraindications and precautions for possible side effects on other organ systems.

Dosage and Administration: One Norinyl tablet orally for 20 days, commencing on day 5 through and including day 24 of the menstrual cycle. (Day 1 is the first day of menstrual bleeding.)

Availability: Dispensers of 20 and 60 tablets; bottles of 100.

JOHN SARGEANT EXECUTIVE SECRETARY

Executive Committee, November 17

The Committee authorized recommendation of the following physicians to the State Board of Health and Mental Hygiene as appointees to the Advisory Committee to the Title XIX program for Maryland: George Bauernschub, MD, Baltimore pediatrician; Gilbert D. Barkin, MD, Silver Spring pediatrician; and William A. Rinn, MD; Richard H. Doss, MD; and Anthony F. Stedem, MD, all Baltimore psychiatrists.

Council, November 17

1. On the recommendation of the Public Relations Committee, the Council authorized an expenditure from general funds for 23 subscriptions to *Today's Health* as gifts from the Faculty to Maryland's colleges and universities. The subscriptions will begin in January, 1967, and run for the ten-month school year at an annual cost of $38.64.

2. The Council rejected a proposal to allocate funds for the transportation and lodging of Faculty representatives asked to attend national meetings on the grounds that the current policy of acting upon individual requests for such funds is adequate and accomplishes the same objective. The Committee on Postgraduate Education, Preventive Medicine and Public Health, which made the recommendation, will be advised of the reasons for its rejection; current committee chairmen will be informed of the particulars of the present policy; and future committee chairmen will be so informed at the time of their appointments.

3. Physicians' Defense was ratified for four cases.

4. As a result of queries on the manner of handling Physicians' Defense cases, it was agreed that the Bylaws should be amended to eliminate disparity in interpretations of "based on its merits."

5. Settlement of a case against a physician was reported.

6. Compulsory membership of Faculty members in the American Medical Association was considered in the light of the AMA benefits enjoyed by those who do not share in the cost of rendering them. It was the consensus of the Council that such a change should not be made at this time, but that Faculty members should be encouraged in every way possible to join the AMA.

7. On the recommendation of the Finance Committee, the Council accepted, on behalf of the Faculty, the assignment of a royalty payment from Henry P. Laughlin, MD, and adopted a motion to continue to accept such assignments subject to an agreement approved jointly by the

Council and by Dr. Laughlin.

8. The dates recommended by the Executive Committee for 1967 Council Meetings were approved.

9. Emeritus Membership to the House of Delegates was approved for Philip J. Hirshman, MD, of Hagerstown, and, subject to verification of the fact that he is no longer engaged in active practice, for Samuel L. Tabb, MD, of Wheaton.

10. An amendment to the Employees Pension Plan, as presented by legal counsel and as required by the Internal Revenue Service, was adopted.

11. At the request of Manning W. Alden, MD, who spoke on behalf of the Public Relations Committee, permission was granted to the Committee to explore further the possibility of having the S. S. HOPE dock in Baltimore, with Faculty sponsorship, in late 1967 or late 1968.

12. Acting upon the recommendation of the Policy and Planning Committee relative to the continuing shortage of family physicians, the Council approved the formation of a Committee to arrange for talks to all medical school classes on the various aspects of family practice, with the suggestion that the members of a similar committee of the Maryland Academy of General Practice be asked to serve, in this capacity.

13. An amendment to the Med-Chi Insurance Trust, approved by legal counsel, was unanimously adopted.

14. Because of a lack of adequate information, the Council voted to postpone any discussion of a proposed clinic for chronic respiratory diseases until the January, 1967, meeting.

15. The Executive Secretary was granted authority to approve the enclosure of Component Society material in Faculty mailings, with such enclosures going either to all Faculty members or to only those who are members of the Component Society involved.

16. The Council was informed that the Bylaws do not at present place any limit on the number of absences from Council Meetings permitted any Council member, and that the Bylaws Committee is considering the recommendation that membership be terminated if three consecutive meetings are missed without due cause or reason.

17. A motion to approve an amendment to the Laboratory Services Subcommittee Report was discussed and tabled.

18. The Executive Secretary reported receipt of a final copy of the State Health Department's request to National Institutes of Health for a plannig grant on PL 89-239 (heart disease, cancer, stroke), together with the Department's request for Faculty endorsement. The requests will be referred to the appropriate Faculty committee for study and recommendation to the Council.

19. The Council voted to receive the written report of, and to dismiss with thanks, the Ad Hoc Committee to investigate reputed attempts of certain universities to discourage the entrance of medical students in the field of general practice. J. Roy Guyther, MD, was chairman of the Committee.

20. The Council accepted the Med-Chi Insurance trust as the official organization to investigate a retirement program for Faculty members, with the understanding that the proposal of the MedReFund would be given due consideration.

21. On the recommendation of John M. Dennis, MD, the Council unanimously approved of Faculty participation in the Maryland Council on Health Affairs. This council would (1) be a coordinating agency for health facilities and services of all kinds, institutional as well as non-institutional; (2) serve as a central locus for health affairs; (3) serve as a central planning agency for health and service facilities and, in this capacity, assume the functions of the now-defunct Hospital Commission; and (4) act as a coordinating agency for the development of adequate manpower for the health field. The Council expressed its appreciation to Dr. Dennis, who served as Faculty representative to the group involved in the formation of the MCHA and is now serving on a Bylaws Committee preparing appropriate bylaws for recommendation to the Council.

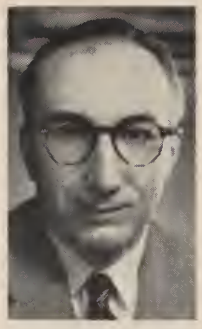
169th ANNUAL

THE MEDICAL AND



The Alcazar,

SCIENTIFIC PAPERS

Dr. Holland

James F. Holland, MD, chief of medicine A, Roswell Park Memorial Institute, will present a paper entitled *The Principles of Cancer Chemotherapy and their Application.* Dr. Holland attended Princeton University and received his MD degree at Columbia University College of Physicians and Surgeons. After serving as an assistant in medicine at Columbia and assistant attending physician at the Francis Delafield Hospital in New York, he became a staff member at the National Cancer Institute in Bethesda. In 1954 he became associate chief of medicine at the Roswell Park Memorial Institute in Buffalo and in 1956 was appointed to his present position there. Dr. Holland is also associate research professor at the State University of New York in Buffalo. He currently has appointments to various groups and panels in the fields of leukemia, solid tumors and chemotherapy.

Dr. De Bakey

Michael E. De Bakey, MD, who will also be a speaker at the Annual Meeting, is a surgeon whose range of activity encompasses many areas. Associated with Baylor University in Houston, he runs one of the largest cardiovascular centers in the world. One of his headline-making projects is the developmental work on an artificial heart. [See MEDICAL NEWS, p. 31] The current model, which surgeons call a left ventricular bypass pump, temporarily takes over the work of the left ventricle.

In the area of government, Dr. De Bakey serves as a presidential advisor on health programs. He is past chairman of the President's Commission on Heart Disease, Cancer and Stroke, and a present or past member of several advisory councils to the National Institutes of Health.

A native of Louisiana, Dr. De Bakey received his BS, MS and MD degrees from Tulane University. Parts of his residency were served at the University of Strasbourg and the University of Heidelberg.

Since 1948, Dr. De Bakey has been professor of surgery and chairman of the Department of Surgery at Baylor University College of Medicine. He is a consultant in surgery at numerous hospitals in Houston and at the Walter Reed Army Hospital in Washington. Dr. De Bakey is a member of some 52 medical and scientific societies, the author of over 25 publications, and in 1965 was named Doctor of the Year by the *Medical World News.*

WALKER *Laboratories* Division of Richardson-Merrell Inc., Mount Vernon, New York 10551

From Baltimore

An original oil painting of Davidge Hall of the University of Maryland School of Medicine was unveiled December 14 by William S. Stone, MD, dean of the school, following its presentation as a gift to the school by George S. Squibb, vice-president of E. R. Squibb & Sons, Inc. Other participants in the ceremonies, which took place at a luncheon at the Lord Baltimore Hotel, included Charles P. McCormick, chairman of the University of Maryland Board of Regents, and William J. Peeples, MD, commissioner of health of the State of Maryland.

The presentation by the pharmaceutical firm is part of its long-range plan, known as "Collegia Medica," to create a collection of original oil paintings of 86 American medical schools. The firm commissioned John Falter to do the painting of Davidge Hall, which is a replica of the Pantheon in Rome. Erected in 1912, it is the oldest structure in the United States from which the degree of doctor of medicine has been granted.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak *your* language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

Medical Society, will open this season on Sunday, January 29, at 2:00 PM on WMAR-TV (Channel 2). The first program—entitled "Are You Confused About MEDICARE?"—will consist of a panel discussion of some of the major questions asked by the public in connection with the Medicare program. Panelists will be: William G. Speed, MD, assistant professor of medicine, The Johns Hopkins School of Medicine; State Senator-elect Carl Friedler; Mr. Denwood N. Kelly, executive director, Maryland Blue Shield; Mr. P. David Youngdahl, administrator, Frederick Memorial Hospital.

The second program, to be shown February 5, will be called "What Does MEDICAID Mean?" and will feature the following panelists in a discussion of Title XIX: John T. Chissell, MD, member of the Advisory Council of Medical Care of the State of Maryland Department of Health; John B. De Hoff, MD, assistant commissioner of health for local health services, Baltimore City; Wilson L. Grubb, MD, president, Maryland Academy of Pediatrics.

* * * * *

The Maryland Association of Private Practicing Psychiatrists and the Maryland Psychiatric Society have established an annual prize in honor of Wendell Muncie, MD, to be awarded for that piece of original research adjudged to be the most meritorious from those submitted to its committee for consideration. The research is to be done by one or more Maryland psychiatrists out of medical school less than ten years, according to an announcement by Michael J. Bisco, MD, chairman of the prize award committee.

There is to be an award of $100 to the winner, and the paper will be presented at a joint meeting of the Association and the Society on March 9, 1967. Manuscripts must be submitted by February 15, 1967, to Dr. Bisco at 11 East Chase St, Baltimore, Md 21202.

From Washington

The National Institutes of Health is concentrating its efforts in the artificial heart field on support of programs for development of auxiliary heart-pumping devices instead of a complete artificial heart.

The programs include those led by Michael E. De Bakey, MD, of the Baylor University College of Medicine, Houston, and Adrian Kantrowitz, MD, chief of surgical services at Maimonides Hospital, Brooklyn. Other teams working on developing complete artificial hearts will continue their research, but the government will not emphasize their approach.

The decision to forego for the present a major program to build a complete artificial heart was made by James A. Shannon, MD, NIH director, after he determined that not enough fundamental information exists on just how the heart operates to make such a project feasible.

Dr. Kantrowitz described the problems involved in designing artificial heart devices in a speech at a meeting of the American Society of Mechanical Engineers in New York.

"The heart is not a simple pumping device. It receives thousands of signals from other parts of the body," he said.

"For example, when a good-looking blonde walks down the street, your heart speeds up. To make mechanical hearts respond to a blonde will not be so easy. It's better to leave the heart in place to respond to all these signals and make a mechanical pump as an auxiliary device to do most of the work."

Dr. De Bakey is working toward development of a device that would allow the heart to rest long enough for it to recover its strength and resume its role in the body without assistance. Dr. Kantrowitz is working toward development of an implantable auxiliary device that would permanently aid those whose hearts cannot function adequately alone. Both these approaches and others similar to them are of the type the institute wants to support.

"We want to develop both a family of highly efficient short-term devices to tide people over acute heart attacks, and also completely implantable heart-assist devices," an NIH spokesman said; "then, after this type of development is worked out, and devices have been proven in

LOOK TO THE ULTIMATE IN NURSING HOMES

What makes Community Health Facilities *different and better* than other nursing homes in Maryland? The main reason they stand out from all the other homes is that these eight health institutions are made up of skilled people whose entire lives are devoted to the profession of helping others. These pepole are interested concerned and thoroughly conscientious regarding every guest they have. At a Community Health Facility, each and every guest receives personalized individual care that guarantees them a pleasant stay whether they are receiving convalescing or restorative long term rehabilitative care.

COMMUNITY HEALTH FACILITIES FEATURE:

- Registered Nurses—24 hour nursing care
- Open medical staff—your doctor continues to care for you
- Special diets under the supervision of an Accredited Dietician
- Modern hospital equipment—Oxygen, Intravenous, Suction Therapy
- Physical Therapy Available
- Air Conditioning Available
- Religious Services
- Recreational Areas
- Separate Units provide separation of convalescent from sicker patient
- True convalescent section—Intensive are Unit
- And *best of all . . . attractive and sensible rates*

clinical trials with a high degree of reliability, and it looks as if total heart replacement is feasible, we will push toward that goal."

Dr. Kantrowitz praised the partnership between physicians and engineers in the artificial heart field, but said efforts must be made to ensure that leadership in research remains with the medical profession and is not given to engineers who do not fully understand the medical problems involved.

* * * * *

Obesity has become a major health problem in the United States and a special health hazard for three obesity-prone groups, according to the Public Health Service.

Quoting a new PHS source book for health professionals, *Obesity and Health,* the Service reports that the prevalence of obesity in this country is a source of growing medical concern because "fat people are more likely to develop certain diseases and to die at an earlier age than people of normal weight."

Prime candidates for the development of obesity, according to the PHS, are:

1. Children whose relatives are obese: In one study, 73% of 1,000 obese patients had at least one obese parent.
2. Heavily built persons who also have corpulent tendencies: Obese individuals usually have a heavier physique than their non-obese counterparts. Large-boned and thickly muscled persons who fit this description, particularly adolescents, should be watched closely.
3. Persons who are becoming less active, more sedentary: Food intake does not decrease proportionately with a decrease in energy expenditure. As activity decreases, for whatever reason, the risk of developing obesity increases.

The Service said that while a substantial amount of obesity exists at every age in both sexes, obesity in children and adolescents is a particulary discouraging omen for the future.

"Obese children and adolescents are a major reservoir for obesity in adult life," the source book said. "They are more likely to remain obese as adults and to have more difficulty in losing fat

and maintaining fat loss than people who become obese as adults."

* * * * *

As a result of a joint government-industry effort to reduce accidental overdose, no bottle of children's aspirin sold after July 1, 1967, will contain more than 36 tablets. This restriction was one of several steps announced jointly by the Food and Drug Administration and 32 drug firms after a conference aimed at curbing childhood deaths and illnesses.

* * * * *

Also by July 1, aspirin for children will be limited in potency to 1¼ grains per tablet, and every bottle will contain this cautionary label: "Precaution: No cap is 100% childproof. In case of accidental overdose, notify physician immediately."

* * * * *

William H. Stewart, MD, surgeon general of the Public Health Service, says the nation's hospitals need 20% more professional and technical workers—primarily nurses—to provide the best patient care.

Stewart's statement accompanied the report of a joint US Public Health Service-American Hospital Association survey which showed that more than 80,000 additional nurses and 40,000 practical nurses are needed, plus 50,000 aides in general hospitals, 30,000 in psychiatric institutions, 9,000 medical technologists, 7,000 social workers and 4,000 physical therapists, X-ray technologists and surgical technicians.

* * * * *

John W. Gardner, Secretary of Health, Education and Welfare, has appointed a six-member Task Force on Environmental Health and Related Problems and instructed it to "think at least 50 years ahead."

Chairman of the Task Force is Ron M. Linton, who was, until last September, staff director of the Senate Committee on Public Works and is now associated with Urban America, Inc.

The Task Force will be concerned, Mr. Linton said, not only with such obvious threats to health as air and water pollution but with "crowding, noise, lack of open space, lack of mobility, dirt." The Task Force will hold hearings in a number of cities, and is scheduled to report to Secretary Gardner by June 1, 1967.

Mike expects a penicillin injection. He's about to be pleasantly surprised.

His physician is going to prescribe an oral penicillin —Pen•Vee® K (potassium phenoxymethyl penicillin). It's usually so rapidly and completely absorbed that therapeutic serum levels are produced in 15 to 30 minutes. Higher serum levels generally last longer than with oral penicillin G.

Indications: Infections due to pathogens susceptible to oral penicillin G. Prophylaxis of rheumatic fever in patients with previous history of the disease.

Precautions: Skin rash, symptoms resembling those of serum sickness, or other manifestations of penicillin-allergy may occur. Measures for treating anaphylaxis should be readily available: epinephrine, oxygen and pressor drugs for relief of immediate allergic reactions; antihistamines and corticosteroids for delayed effects. Penicillin may delay or prevent the appearance of primary syphilitic lesions. Patients with gonorrhea who are suspected of concurrent syphilitic infections should be tested serologically for at least 3 months. Where lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. As with other antibiotics overgrowth of nonsusceptible organisms may occur; if so, discontinue and take appropriate measures. Treat β-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent development of rheumatic fever or glomerulonephritis.

Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.

Composition: Tablets—125 mg. (200,000 units) and 250 mg., (400,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc. **Wyeth Laboratories Philadelphia, Pa.**

ORAL **PEN · VEE® K**

(potassium phenoxymethyl penicillin) Wyeth®

"Yes, Doctor, the pain is gone."

■ Despite introduction of synthetic substitutes, efficacy of 'Empirin' Compound with Codeine remains unchallenged.

otitis media...

and Gantanol Suspension is a good way to help them get well

proven effectiveness against major U.R.I. pathogens including beta-hemolytic strep

With Gantanol (sulfamethoxazole), bacteriologic conversion rates for beta-hemolytic streptococci are comparable to those generally seen with penicillin, and apparently superior to those cited in the literature for erythromycin and the broad-spectrum antibiotics.[1,2] With conversion rates ranging from a high of 96% in 229 patients[2] and 98% in 96 cases[3] to 65% in 105 cases,[5,6] Gantanol (sulfamethoxazole) Suspension is an effective alternative therapy in patients sensitive to penicillin, the drug of choice in known beta-hemolytic streptococcal infections.

In addition to this effectiveness against beta-hemolytic streptococci,[1-9] bacteriologic conversion rates have averaged 69% for *D. pneumoniae* (103 of 150 patients),[3,6,7] 78% for *H. influenzae* (42 of 54 patients),[3,4,7] and 67% for *Staph. aureus* (76 of 113 patients).[3,4,6,7] It is this wide spectrum of activity which makes Gantanol (sulfamethoxazole) Suspension a good choice in acute pharyngitis, tonsillitis and otitis media.

therapy generally uncomplicated by side effects

Over 8 out of 10 U.R.I. patients—87% of 2231 patients—showed an excellent to satisfactory clinical response to Gantanol (sulfamethoxazole).[1-13] Such favorable results are even more meaningful in view of the fact that only 1.1% of the more than 2000 cases cited discontinued therapy because of side effects. Of the total side effects reported (4.6%), most were mild and included rash, urticaria, itching, dizziness, headache, diarrhea, nausea and vomiting, shivering sensation, skin discoloration and crystalluria.[1-13]

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Acute and chronic respiratory and urinary tract bacterial infections due to susceptible microorganisms. At present penicillin is considered the drug of choice in acute group A beta-hemolytic streptococcal infections; however, Gantanol (sulfamethoxazole) has shown an effectiveness approaching that of penicillin in a large number of patients. If employed in such infections, *it is important that therapy be continued in the usual recommended dosage for a period of at least 10 days.*

Contraindicated in sulfonamide-sensitive patients, pregnant females at term, premature infants or infants during first 3 months of life.

Warnings: Use only after critical appraisal in patients with liver damage, renal damage, urinary obstruction or blood dyscrasias. If toxic or hypersensitivity reactions or blood dyscrasias occur, discontinue therapy. In intermittent or prolonged therapy, blood counts and liver and kidney function tests should be performed. Data insufficient on prolonged or recurrent therapy in chronic renal diseases of children.

Precautions: Observe usual sulfonamide therapy precautions, including maintenance of an adequate fluid intake. Use with caution in patients with histories of allergies and/or asthma. Patients with impaired renal function should be followed closely since renal impairment may cause excessive drug accumulation. Occasional failures may occur due to resistant microorganisms. Not effective in virus or rickettsial infections.

Adverse Reactions: Following may occur: headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, Stevens-Johnson syndrome, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Dosage: Children—1 teasp./20 lbs initially, followed by ½ teasp./20 lbs b.i.d. *Adults*—4 teasp. initially, followed by 2 teasp. b.i.d. or t.i.d., depending upon severity of infection.

How Supplied: Suspension 10%, 0.5 Gm sulfamethoxazole/5 cc teasp., cherry-flavored, bottles of 16 oz.

ROCHE

Eczema of many years... controlled in two weeks

Before treatment

After treatment — with ARISTOCORT Topical Ointment 0.1% for two weeks

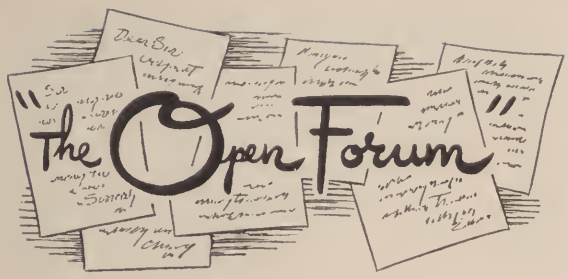
ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.



Available in 5 Gm. and 15 Gm. tubes and ½ lb. jars.

To the Editor:

Because of recent bitter accusations made against the practice of medicine to graduating students, with resulting acrimonious responses, I suggest that you republish an address, entitled "Problems of Practice," delivered in Baltimore in 1952 by the late W. Edward Gallie of Toronto, who was professor of surgery and dean of the Faculty of Medicine at the University of Toronto. It was first published in the *Maryland State Medical Journal* in July 1952.

To me, this address of Dr. Gallie represents the attitude and hopes of the vast majority of those engaged in the private practice of medicine today. In this connection, it has been my stated opinion for many years that something drastic has to be done to reduce the dreadful, and continually rising cost of illness to the patient who has no insurance. We are all familiar with the so-called catastrophic illness, the cost of which may mean the sacrifice of the education of a child, a mortgaged home, the wiping out of the savings account of a life-time. I have believed for many years that the American Medical Association has been remiss in not recognizing the urgency of this problem. Some of this fault lies with those of us who may see the light but are unwilling to attend meetings and stand for elections in political medical affairs; more of the fault is because most of us have not taken the time to study the socioeconomic side of medical practice and taken measures to ease its ever increasing burden on the patient.

Unfortunately, the doctor gets the full blame for this cost, whereas it is, in reality, not the doctor's fee but the ever rising hospitalization charges which have brought us to the present crisis. By and large, the doctors' fees are fair and have increased very little in the last twenty years. There are some doctors, just as there are some individuals in any profession or business, whose charges are unfair and a hardship to the patient, but these doctors are few. The overwhelming majority of those practicing medicine in this country are dedicated individuals who treat the patients who can pay no fee just the same as those who can pay for their care.

The reasons for the ever increasing costs of hospitalization are many, but mainly due to the increase in salaries of all categories of the personnel in a hospital. I am told that 66⅔% of the expense budget of a hospital is due to personnel costs as opposed to 20% in an ordinary business. Added to a continuous increase in salaries and in unavoidable fixed costs, is the universal attitude of complete indifference toward avoiding or reducing avoidable costs. The size of yearly imbalance of a budget is no longer important, the increasing tint of the redness of the ink reflects an inefficiency of no real consequence. The deficit will be made up somehow by increasing again the daily rates to the patient and by asking "the Government" for some grant. In this age of packaged discards, all goods are expendable and are to be used with no thought of waste. How foolish, for example, is the old idea that in the surgical operating rooms one hesitated to break open unnecessary tubes of suture material, or that one hesitated to use up a whole roll of adhesive tape when a bandage properly applied would suffice. Electric lights are *not* made to be turned off when not in use.

The resident house staff is encouraged to believe that the efficiency of an individual member is in accordance with the number of tests and examinations ordered on every patient, however unnecessary. The rooms of the Executive and Administrative Staffs must all be paneled, air conditioned and have wall-to-wall carpeting. Economy as a means of reducing debt is just old fashioned, completely out of date.

How are the expenses of hospitalization to the individual patient to be reduced? The physician can help greatly by treating patients in his office or in their homes when possible and by refraining from ordering unnecessary examinations and tests when the patient is in the hospital. However, even such measures will in no way suffice to relieve the awful cost of necessary hospitalization. "Medicare" for those over 65 years has been an inevitable result of our indifference. A far better

scheme at less cost to the patient and to the general public could have been worked out if we had started earlier. If we are to forestall completely socialized medicine in the United States we must face up to the problem without further delay.

Some greatly broadened base of hospital insurance is necessary. It is my belief that this base should be that of the private insurance companies, including the Blue Cross and Blue Shield; and that the medical profession, with its marvelous record in the conquest of disease under the free enterprise system, should not be pushed around in the future by bureaucrats and civil servants of socialized medicine. In many cases it may be necessary for the Federal and State Governments to help out in the payment of the insurance premium, but we have the brains and the ingenuity in this country to work out the necessary actuarial figures without destroying what has placed us at the pinnacle of medical discovery and treatment.

Finally, I see nothing un-American or wrong with a system whereby, if one works and studies harder and longer, he is rewarded by being able to live a little more comfortably, to educate his children a little better, to give his family a little more security.

Quoting from Dr. Gallie, I will conclude by saying that "in searching for means of reducing the cost of illness what folly it would be to destroy the goodwill of the doctors and to make them sorry they have ever come into the profession. The spectacle of what is going on in England and New Zealand, with their schemes of state medicine, is quite enough to drive bright and clever young men into other fields of endeavour. At any rate, there will be no sons of doctors entering medical school if state medicine comes. I would venture to predict that with the advent of socialized medicine, as it is advocated by the liberal, by the socialist and by the communist parties, this golden age of medical discovery will come to a close and we shall enter a period when progress in the study of health and disease will bog down to the speed of the civil service. The idea that medical research can be kept alive by government grants is just silly if it turns out, as I think it will, that the bright boys will no longer want to be doctors and will no longer enter the schools."

I. Ridgeway Trimble, MD

(Dr. Trimble is president of the Johns Hopkins Medical and Surgical Association. In accordance with his suggestion, "Problems of Practice" will be reprinted in the February issue of The Journal. Ed.)

DOCTORS TOP LIST IN PUBLIC ESTEEM

Doctors head the list of major professions and occupations, according to a *Newsweek* magazine survey of the professions and public esteem.

The study by Louis Harris and Associates showed 74% of Americans have a "great deal of confidence" in doctors. This is the highest rating received by any of the 17 professional groups listed.

Scoring lowest are those in the communications industries and labor leaders.

The results were drawn from a demographically representative sample of 2,000 individuals throughout the nation as part of a study into the public's attitude toward the business community and its practices.

The occupations and their "confidence scores:"

Doctors 74%
Bankers 70%
Scientists 66%
Military Leaders 65%
Educators 62%
Corporate heads 58%
Psychiatrists 57%
U. S. Supreme Court judges 54%
Local retailers 50%
Clergy 45%
Congressmen 44%
Federal government leaders 44%
Reporters, publishers 30%
Television heads 26%
Arts 24%
Labor leaders 24%
Advertising men 22%

Editorial

THE BASIC REASON

In the past years most physicians have preferred to abstain altogether from politics and have left this area to professional politicians. If the latter were as competent in their actions as, on occasion, they would have us believe we are *not* in ours, this idyllic state might have persisted. Unfortunately, reality is hard upon us and there is no recourse but for some of us to carry our joint views into the political battle-field in a coordinated manner. In this fashion, we can make our opinions heard and our combined strength felt.

Herein lies the reason for the formation of the Maryland Medical Political Action Committee. A voluntary, non-profit, unincorporated group of physicians, their wives and other interested persons, the MMPAC has a dual purpose: to enhance the political knowledge of its members and to provide them with a means of concerted political action.

Let this fact be firmly clarified: we are not affiliated with any specific party. We select and support an individual candidate on the basis of his program and his platform, not his party affiliation.

Let another fact be clear: we function independently of the Medical and Chirurgical Faculty of the State of Maryland. While the Faculty is free to contribute to MMPAC, it may do so only for educational, and not for political, activities.

For the benefit of those who have inquired about the inclusion of MMPAC dues on bills for 1967 Faculty dues, it should be noted that the Executive Committee and the Council of the Medical and Chirurgical Faculty voted for the inclusion of MMPAC dues, which are payable on a voluntary basis, provided that the format and the content of the bills rendered met all legal requirements. On advice of legal counsel, it was determined that the costs of printing and of handling these contribution requests should be borne by MMPAC.

The Executive Committee and the Council also ruled that MMPAC dues should be shown on Faculty bills as a line item in a manner similar to that of itemizing the present voluntary contribution to AMA-ERF.

Now that the time for paying our annual dues has arrived, we hope every Maryland physician will look deep into his political conscience and clearly see his way to help MMPAC obtain the goals for which it was designed. We firmly believe that by helping this Committee, he will also aid the medical profession as a whole.

Joseph H. Hooper, Jr., MD
Chairman, MMPAC Executive Committee

SEMINAR ON THE MEDICAL ASPECTS OF TRAFFIC SAFETY

The Seminar on the Medical Aspects of Traffic Safety was held in Baltimore on October 12, 1966, under the joint auspices of the Medical and Chirurgical Faculty of the State of Maryland and the Maryland Chapter of the American College of Surgeons. The subjects of four talks in the morning session were also the subjects of four workshops in the afternoon session, which ended with a summation of workshop conclusions. At an intermediate luncheon, the three principal gubernatorial candidates in the 1966 State elections expressed their opinions of appropriate legislation needed in Maryland to reduce the State's ever-increasing traffic fatalities.

Following an introduction by John E. Miller, MD, president of the Maryland Chapter of ACS, one of the co-sponsors of the Seminar, and "Words of Welcome" to the Seminar from the Honorable J. Millard Tawes, Governor of the State of Maryland, the four morning talks are presented here in their entirety. The subjects and the speakers, in the order of presentation, are:

The Role of Alcohol in Traffic Fatalities in Maryland—Russell S. Fisher, MD

Drugs and Driving—John C. Krantz, PhD

Medical Conditions and Driving Ability—A. J. Mirkin, MD, FACS

Legal Problems Involved in the Development of Legislation—J. Dudley Digges, Chief Judge

Traffic Safety: An Introduction

JOHN E. MILLER, MD

President, Maryland Chapter, American College of Surgeons

Accidental injury constitutes one of the biggest of today's health problems and ranks third, behind cardiovascular diseases and cancer, as a cause of death in this country. Automobile accidents result in more than 50,000 deaths and 4 million injuries each year, and are the first cause of death among young people between the ages of 15 and 24.

Across the nation, the number of deaths due to such accidents increased by 17% in 1964 and again in 1965. In Maryland, according to the Maryland Traffic Safety Commission, 747 deaths due to traffic accidents in 1966 had occurred as of January 2, a figure already in excess of the official count of 698 for the previous year and likely to be higher, because of delayed deaths, by the cut-off date of March 15. The total injured,

and the disabilities of survivors, with consequent economic loss, cannot be accurately evaluated because of the lack of statistics due to deficiencies in reporting by various treatment facilities. It is estimated, however, that the national cost of 1965 motor vehicle accidents was $8.2 billion and that the comparable figure for Maryland was $102 million.

That the automobile has created a major health and economic problem, needful of control, is thus obvious. Nevertheless, until recently, national traffic safety standards were established by the automotive industry and it is unrealistic to think they would encourage driver restrictions and/or vehicle alterations that might be costly and, at the same time, would eliminate many of the appealing features that helped them establish new national sales records. It is only in the past year that the public outcry has been great enough to force the automobile industry into certain structural automotive changes. The result of this has reflected on the national economy as a whole and pinpoints the difficulty of trying to establish controls in an industry that has become a major staple item of the economy. Because of its very bigness, it will perhaps bow only to federal control. However, the fact that relief can be obtained by the appropriate cooperative action of interested and involved parties has been amply demonstrated in industry, another example being the problem of suffocation deaths in refrigerators.

Medical science has made great progress in the prevention of death and disability in the treatment of the injured. The effectiveness of this is demonstrated by the mortality rate of approximately 4% of the injured treated in the Vietnam war, though comparative statistics for automobile-accident injury are not available. Continuing progress is being made in medical science in the treatment of the injured, but it is obvious that improvement here will have little effect on the over-all salvage. The United States Public Health Service, the American Medical Association and the National Safety Council combined in a public education program to promote acceptance and availability of seat belts in the United States and thus significantly reduced the estimated 25% of fatalities caused by ejection from the vehicle.

In Maryland, in order to expedite the transfer of the patient from the accident scene to the hospital, and to ensure his arrival there in the best possible condition, the names and locations of nearest hospitals have been posted along major roadways and, with the help of the Medical and Chirurgical Faculty, a training program for ambulance crews has been established. The Faculty has also recommended that some thought be given to licensing ambulance attendants so that minimum standards of training will be required.

For the physician to do more it is obvious that his efforts must be extended to the factors involved in accidents, and it would seem that throughout the history of medicine it is in the role of *prevention* that the physician's efforts have been most rewarded.

Of the three factors involved in automobile accidents (driver, vehicle, and road environment), the driver is regarded by most authorities as the principal cause. It is the young male driver who is most frequently involved. It seems that just at the age when the young male is bursting at the seams to release his aggressive tendencies, and usually after minimal training, he is given a license to drive a high powered car on high speed highways where restraining bonds are not as evident and where he can give vent to these tendencies.

It has been estimated that to drive a car today requires satisfactory resolution of 20 to 60 decisions each mile. The older driver, whose reflexes are not as good in the modern maze of high speed highways, is equally at a disadvantage. A recent study indicates that drivers with medical conditions who are 60 years of age or over have almost twice as many accidents per million miles of driving as all drivers under that age. In this same study, drivers with medical conditions are generally shown to have a higher accident and/or violation rate than drivers without medical conditions.

The medical literature is replete with accidents due to drug intoxication. The major intoxicant is alcohol. The true extent of its damaging effects is not known, but it has been shown that the blood-alcohol level was moderate or greater in approximately 40% of the driver fatalities in the nation.

So that additional factual information related to this problem would be available, and appropriate action might then be expected from responsible agencies, the Medical and Chirurgical Faculty supported enactment of the implied consent law, unsuccessfully, by the 1966 Legislature. There are many contributing elements which render a person

an unsafe driver from the medical viewpoint, but there are not sufficient well-controlled studies to pinpoint the exact contribution of each so that proper action for control can be advised.

Physicians have been reluctant to participate actively in the formulating of decisions that might encroach on the historic medical right of privileged communication between patient and physician, especially where the appropriate action for community-health benefit might oppose that of individual-health benefit. Nevertheless, the medical profession set a precedent in its treatment and prevention of infectious diseases by establishing the fact that individual health is best achieved with community-health improvement. Standards such as this required physician recommendation for adoption by legislative action. Similar legislation was recently enacted in an attempt to control child beating. Medicine must now come to the fore again and evaluate one of our major health problems as it pertains to the medical aspects of highway safety.

There has been much to do recently in the establishment of major health centers for research and treatment of cardiovascular diseases, cancer and emphysema—to the last of which the by-products of the automobile are contributing factors. This work has been strongly supported by the medical profession, prominent public officials, mass news media and various government agencies. In contrast, the position of a national director for automobile safety and accident prevention has only recently been established, and government research figures for 1965 reveal that $16.5 million was allocated for traffic-accident prevention as compared with total expenditures for medical, health and related research of approximately $1.85 billion. Much more needs to be done in research of highway traffic accidents, and appropriate budgetary allotment is a necessity.

The automobile is a requisite of today's life and although it is defiant of control, like all other major health problems it will nevertheless lend itself to conciliation when a concerted effort is made by responsible agencies, the public, the automobile industry itself, and the physician. The Medical and Chirurgical Faculty and the Maryland Chapter of the American College of Surgeons, together with other interested non-medical groups planned this Seminar, with its evaluation of the medical aspects of traffic safety, in the belief that it will lead to better understanding of the problem and thence to effective controls, legislative and otherwise.

Words of Welcome

J. MILLARD TAWES

Governor of the State of Maryland

May I begin by expressing my gratitude, and the gratitude of the people of Maryland, to the Medical and Chirurgical Faculty of the State of Maryland and the Maryland Chapter of the American College of Surgeons for conceiving, planning and executing this important Seminar on the Medical Aspects of Traffic Safety.

I have looked at your program for the day, and I am profoundly impressed, both by the caliber of the discussion leaders and by the subjects which will be discussed at this seminar.

I hope to receive a full account of the proceedings, and I hope that groups which I have chosen to study and try to find a solution to this immense social problem will take advantage of the ideas that will be discussed here and the suggestions that will be proposed by your group.

Certainly we have here in this assembly the talent and the experience to provide an insight into such problems as those created by the motorist who drives while under the influence of alcohol or drugs.

As you know, these drivers are the chief contributors to the prevalence of highway accidents and the frightful toll they take in killings, maimings and the useless destruction of property.

Being practical people, we are aware that there probably exist no means or measures by which we may expect a total elimination of highway accidents. We, nevertheless, must not relax in our efforts to reduce the mishaps, and, just as you are doing here today, continue to work unstintingly to develop the best possible weapon to fight this growing social evil.

As I have said so many times, highway safety is a joint responsibility of government and of citizens, acting either as individuals or collectively, as is the case with this group. Government should provide the leadership, but it cannot do the task alone. That is why discussion groups such as are assembled here today are so important in the over-all effort we are making in Maryland to reduce accidents.

Last June, I established a new position on my staff, the position of Executive Assistant for Traffic Safety, and named to the position Mr. William Prescott Allen, publisher of the *Bethesda-Chevy Chase Tribune*.

At the same time, I established a Traffic Safety Advisory Council, designating Mr. Allen as chairman, and including in its membership Colonel Carey Jarman, superintendent of the Maryland State Police; John R. Jewell, Commissioner of Motor Vehicles; and John B. Funk, chairman-director of the State Roads Commission.

My instruction to the council was that it coordinate all suggestions and recommendations for the improvment of safety on the highways of Maryland and that it develop a highway safety program for the State designed to attack every facet of the traffic safety problem.

I am told that this group has been in close touch with the Medical and Chirurgical Faculty and that it has received valuable assistance from the members of that organization.

Also, I instructed the council that it was to be responsible for developing a safety program that will assure the full participation by the State of Maryland in funds available under the provisions of the Federal Highway Safety Act of 1966 and in other highway safety programs which the Federal Government may develop.

At the session of the General Assembly earlier this year, more than 100 bills relating to traffic safety were introduced, and I am told that the sheer number of bills alone was a factor in the failure of the legislature to produce an effective program of traffic safety.

This is one of the reasons why I asked the Advisory Council to develop a comprehensive legislative program, representing the best thinking of groups such as this on the subject.

I am advised that the complete program of legislative proposals, in bill form, will be ready next week.

I know that all of you here are as disappointed as I am with the traffic accident record that is being written in Maryland this year. In fatalities, in injuries and in the number of accidents, we are running far ahead of last year. Last year itself was much worse than the year before.

This, of course, is not a condition which exists in Maryland alone. In the country as a whole, traffic accidents cost the lives of more than 50,000 persons each year, and the figure climbs with each successive year.

It is poor consolation, however, that other areas of the country are as bad as we are, or worse. Our concern is that many hundreds of persons are killed on the highways of our State each year, and that the number of persons injured in accidents is many times more than that.

We must not be discouraged, however, by the enormity of the problem. We must not relax our efforts simply because ours is a problem that defies solution. We must, on the contrary, work harder, because any betterment of conditions means the saving of precious human lives.

That is why it is so gratifying to me, as the chief executive of the State, to witness this display of selfless, public-spirited concern for the safety and the well-being of the people of Maryland.

Again, please accept my commendation for your efforts, and with it my deep appreciation for the assistance you are offering in the gigantic task of making the highways of Maryland safer for our own citizens and for those who visit our beloved State.

The Role of Alcohol in Traffic Fatalities in Maryland

RUSSELL S. FISHER, MD
Chief Medical Examiner
State of Maryland
Department of Post Mortem Examiners

Before I show some of the grim statistics of traffic deaths due to driving while under the influence of alcohol, I would like to make a plea to those here who represent the public communications media to enter into the spirit of affirmative traffic safety education and accident prevention. By this I mean that, as in the case of the ten commandments, most of which begin, "Thou shalt not . . ." (for example, you shall not drive under the influence of alcohol, and you shall not drive carelessly), there is one greater commandment that boils down, as the Lord said, to, "Love thy neighbor as thyself."

This is affirmative. It gives us something good to do instead of a lot of "thou shalt nots." I think if we are to solve the murder-on-the-highway traffic problem, it will take more than the police and the medical examiner, the State's Attorney and the courts, in the thou-shalt-not phase. It will take an active educational program on your part and on the part of all those who have access to the public mind, a program which does not merely say, "Thou shalt not drive carelessly," but which teaches us to drive safely.

Having indicated, therefore, that I think what can be done in prevention by legal enforcement is but a small part of what we need, I will do what I was asked to do here today: explain to you or show you some of the evidence that indicates that one medical condition, namely, an excess of alcohol in the system, is an important factor in the deaths that occur on our highways.

If we look at the scale on the left of the Figure, we can get some idea of the relationship of the level of alcohol in the system to our ability to be safe drivers. This slide shows blood-alcohol concentrations in actual percentages. Thus at the top we are dealing with one-half of one percent of alcohol in the blood. Fifteen hundredths of one

percent is the level which, for many years, has been accepted as the absolute maximal blood-alcohol concentration for an individual still to be reasonably able to drive an automobile.

Indeed, as a result of studies in the past few years, all the national groups, including the American Medical Association and the National Safety Council, and all experts in the alcohol and chemical testing fields, have agreed that only one-tenth of one percent is the level above which drivers are unfavorably influenced in their ability to control a vehicle. So we say, with no hesitation, it is highly probable that the individual is "under the influence" in the range of 0.10% to 0.15%, and it is certain that he is under the influence if his blood-alcohol level is above fifteen hundredths of one percent.

In Maryland, by law, one is presumed to be under the influence if his blood-alcohol level is shown to be fifteen hundredths of one percent or greater. Bearing these figures in mind, let us look at Table 1, which presents actual statistics for this State.

In 1965 there were 274 drivers killed in motor vehicle accidents on Maryland highways. It is part of the Medical Examiner's job to test the individuals who die as a result of violent death in motor vehicles to determine whether the driver had been drinking significantly.

Some drivers survive a number of hours or days after accidents and any alcohol present in the system at the time of accident would have been burned out by the time of death; these drivers are therefore not tested. When individuals die immediately, or within a few hours, their blood-alcohol level is automatically checked.

ALCOHOL ANALYSES IN MOTOR VEHICLE FATALITIES—1965

Drivers Involved in Fatal Accidents		846
Drivers Killed		274
Number of Driver Fatalities Analyzed		149
Results of Analysis of Blood		% of total tested
Negative	51	34
.01%- .05%	6	4
0.06%-0.09%	12	8
0.10%-0.14%	26	18
0.15% or more	54	36

Table 1

Of the 274 drivers who died in 1965, 149 were checked by our department. Reduced to percentages, reports on the tested drivers were negative for 34%: they had not been drinking. Another 4% had not been drinking significantly; they may have had a cocktail. We do not believe they were under the influence. There is another 8% who were in the low range, and it is difficult to say with any certainty that their behavior was influenced.

But there was a total of 18% whose blood-alcohol level was in excess of .10% and there were 36% in whom it exceeded .15%—a total of 54%, more than half of all the drivers tested after being killed on highways.

You may say, "Doctor, how do you know that the alcohol level which was evaluated had anything to do with their deaths?" I must admit this is a little difficult to prove, but I think you will agree with me that half of all the people driving the highways in the State of Maryland are not carrying blood-alcohol levels of above .10%. You would have to assume that would be equally true if you disagreed with me in the conclusion that the alcohol had something to do with their deaths. There has to be a relationship between this high concentration of alcohol and the extremely high proportion of drivers who were involved, and indeed killed, in fatal automobile accidents.

It is obviously true of course that, in addition to this 54%, some of the individuals who were killed, were killed by drunken drivers who did not happen to get killed and tested themselves. So the conclusion that more than half the drivers who met their deaths in vehicular accidents were, in some degree at least, victims of alcohol seems highly supported.

Table 2 takes us to the question of testing the non-fatal individuals on the road whose driving is thought by the police at the time of their arrest to indicate they are under the influence of alcohol. In 1965, there were 663 drivers tested by the Maryland State Police under their breathalyzer testing program. Some 83% turned out to have .15% or more blood-alcohol. This means that the police, as a result of their experience in apprehending these individuals, believed when they saw them that they were under the influence; they asked them to take the test; the test was taken and it corroborated their original impression in 83% of the cases. Indeed, with the addition of another 12% of the 663 whose blood-alcohol was at the .10% to .14% level, there were actually 95% who had been imbibing significantly, so that there seems no doubt their ability to operate a vehicle was impaired.

RESULTS OF BREATHALYZER TESTS BY MARYLAND STATE POLICE—1965

Blood Alcohol	Number	Percent of Total
.05% or less	17	3
.06% to .09%	13	2
.10% to .14%	82	12
.15% or above	551	83
Total	663	100

Table 2

Obviously this information is useful in prosecution. It does help the police in their efforts to keep the drunken driver off the road. So why are we not doing better? Table 3, I think, answers the question very promptly.

We are not doing better with the chemical test law, which is certainly one of the tools in law enforcement in these cases, for the prime reason that of all people who were asked to take the test, (the law requires that the test must be offered on

a voluntary basis), more than 40% refused. They did not cooperate with the police in providing evidence that indeed they were under the influence of alcohol, or were not, as the case may be.

BREATHALYZER TESTS BY MARYLAND STATE POLICE—1965

Tests Offered	1114
Tests Given	663
Tests Refused	451
Percentage of Refusals	40%

Table 3

I would mention very briefly, before we leave the subject, the 5% of individuals who were tested, and whose tests were negative. This is a side effect, you might say, a side benefit of the law—because it is important to "follow through" when an individual appears to be inebriated, and the chemical tests reveal that he in fact is not drinking at all. Obviously he is medically ill; there must be some other explanation of his apparent drunkenness. Of course these people end up in the hands of physicians who then treat their diabetes, or their drug intoxication, or whatever it may be that was misinterpreted as evidence of their being under the influence. This is simply a safety factor in protecting the non-involved individuals.

I want to go back to this for a minute because there has been a bill before the State Legislature for several years which would provide for what we call "implied consent." If this were enacted, individuals who refused to take the test after having been arrested and charged with driving while under the influence, would be subject to loss of their driver's license for a certain period. If one is to make the chemical test program effective as a means of discouraging driving while under the influence of alcohol, one must have a mechanism for using the test in all the cases in which the question has been raised. As it stands now, with 40% of the suspects refusing the test, the mechanism of prosecution is largely inactivated.

The police, the Medical Examiner, most individuals who are safety minded, believe that the implied consent law, which would subject the individual who refuses to take the test to at least a period when he would not be driving on the highways, is a good law, and one that we should have. We will not take the time to discuss it further here today, but I think it is important for all of you to recognize that part of the problem of vehicular accidents and deaths due to alcohol is enforcement, and part of the failure of enforcement is due to the inadequacy of the laws which provide the police with the tools for enforcement of the ban on driving while under the influence.

I have little more to add. I would summarize this simply by saying that there have been many studies of alcohol and driving. Our own experience through the years indicates that the figures I showed you for 1965 are about the same as they were ten years ago. Between a third and a half of the drivers killed on the highways are under the influence; between a third and a half of the pedestrians killed have a high blood-alcohol level at the time they are struck; and even a good many of the passengers are under the influence at the time they are killed.

I can present the business of the pedestrian a little bit differently because basically you can divide the pedestrians into three groups. There are children who, foolishly and because they are children, jump out in front of automobiles. Of course the children have not been drinking. There is an elderly group—and I will not attempt to define that in years because each year "elderly" gets older than it used to be—and the elderly people are hard of hearing, or have visual deficiencies, or are impaired physically, so that they cannot dodge the oncoming car very effectively, and it is our experience that among these people about 25% to 35% will also have been drinking when they are hit as pedestrians.

The children make up about one-third of the victims, the elderly people about one-third of the victims, and then there is what we call a middle third, the people perhaps between fifteen years at the youngest and some ripe old age at the top. This middle third are of special concern to us because we wonder why should they be killed. I will tell you why: two-thirds of them are under the influence of alcohol at the time they are hit by an automobile.

I am convinced that alcohol has something to do with motor vehicle deaths. I believe that this opinion is held by all of the doctors in the State, and I hope whatever medicine can do to help curb this excessive use of alcohol, and thereby help to prevent the carnage on the highway, we will do.

Drugs and Driving

JOHN C. KRANTZ, JR., PhD
Professor Emeritus of Pharmacology
University of Maryland School of Medicine

It seems trite to say that we have entered into a mechanical age, and that the tempo of life has materially increased. If our forebears missed a stagecoach, they were rather happy about it; it gave them several hours of relaxation and rest awaiting the arrival of the next coach. We, however, have increased the tempo of our lives to such an extent that we let out an oath if we miss a slot in a revolving door.

We often create a great deal of motion without too much sense of direction. An astute observer of our generation has said, "To preserve a man alive in the midst of so many changes and hostilities is almost as great a miracle as creating him."

The pace of the mechanical age has produced a symptom in our emotional life, and that symptom is anxiety. Anxiety resembles a fleece-like fog that envelops an individual. It begins nowhere, it ends nowhere; it has no perimeter. It engulfs the individual and takes away his self-confidence.

In order to regain his self-confidence and emotional stability, the individual takes recourse to drugs. We are a drug-taking nation. Taking drugs is a favorite American pastime. Osler said, "The great difference between man and other primates is that man likes to take drugs."

Fortunately for the human race, within the last decade the pharmacologists have made a frontal attack upon emotional instability, thinking disturbances and anxiety. This frontal attack has brought us a class of drugs commonly referred to as tranquilizers or psychotropic drugs. These drugs affect the mood and thinking of the individual.

It is abundantly clear if a drug is going to affect the thinking of an individual, it is going to affect his operation of a motor vehicle. Let us then consider some of the classes of drugs which people take in abundance, and how they may affect the driving skill of an individual.

There are the analgesics. What does this mean?—pain-killers. Pain is a tax that is levied on everyone as the price of life on this planet. Some persons are taxed heavily and others lightly, but all are taxed. One of the great pain-relieving drugs that we take in abundance in America is the miracle drug of the turn of the century, aspirin. How much? Daily the American public ingests 37 tons of aspirin. So we really like this drug.

Fortunately, aspirin has its effect in relieving what we call integumental pain—muscle pain, neuritis and neuromuscular pain in general. It acts in the thalamus and the periphery, and does not affect the cerebral cortex, the area of the brain concerned with thinking. Therefore, for almost everyone, the taking of aspirin and the operating of an automobile are perfectly compatible.

On the other hand, aspirin does not relieve deep visceral pain, the pain, for example, of a kidney stone or of peptic ulcer. For these types of pain one must take recourse to narcotic drugs such as morphine or meperidine. These drugs do affect the cerebral cortex. They elevate the threshold of pain; they produce a false euphoria. They disassociate the individual from his environment. They isolate him from his surroundings, and certainly a person under the influence of one of these analgesic drugs should not operate a motor vehicle.

The next class of drugs is represented by the hypnotics. Insomnia is one of the products of our age. Phenobarbital, developed in 1912, is an excellent drug. It is used not only for insomnia but for daytime sedation, and also to quell anxiety, the emotional overhang of certain types of diseases such as peptic ulcer, hypertention and angina pectoris.

Phenobarbital is a very popular drug among the members of the medical profession. We ingest approximately one ton of phenobarbital every day. Certain individuals can take phenobarbital and operate a motor vehicle without performance impairment. One should be warned, however, that it may make him drowsy, that phenobarbital is a sedative drug, and that if one takes phenobarbital and simultaneously ingests alcohol, the action of the two is synergistic and may produce a very definite driving hazard.

To induce sleep at night, phenobarbital is not the drug of choice, but one of the so-called short-acting barbiturate derivatives. Among these are

pentobarbital (Nembutal®) and secobarbital (Seconal®); these drugs act more promptly and for a shorter period of time. They are much better for producing sleep in the evening. One should be very careful, in prescribing these drugs for insomnia, not to give the patient who has difficulty in getting to sleep a long-acting barbiturate like phenobarbital. Phenobarbital evokes nocturnal sleep but when one awakens in the morning, his awareness is blurred. He is then thrust out into the traffic of the expressway when his judgment is impaired by the effect of the drug that has not yet worn off. Doctors know that this can be avoided by the use of Seconal® or Nembutal®, as I have already suggested.

We have discussed some of the depressants to the central nervous system. Let us now consider some of the stimulants to the central nervous system. The old and time-honored caffeine is an excellent stimulant. It, of course is present in coffee and in tea. People have often wondered: does caffeine stimulate the ability of the muscle to contract and thus provide more strength and power? No. It lifts the mood, it stimulates the spirit; it is a psychic stimulant.

In 1938, when the Olympic Games were held in Berlin, Eichler studied the effect of caffeine on the performance of several of the athletes. In the hundred-meter sprint, where judgment was not required and only speed of running was involved, caffeine had no effect. But in shotput, high jumping and broad jumping, caffeine had a definite effect, improving the performance.

Furthermore there seems to be no backlash from caffeine. There is no feeling of letdown after its effects have worn off; ingested in coffee and tea, it is therefore perfectly compatible with driving a motor vehicle.

There are other types of stimulants, for example amphetamine (Dexedrine®). How does this act? It is a "benny." It superimposes a hyperexcitability over fatigue and gives rise to restlessness, irresponsibility and lack of judgment. It is therefore certainly incompatible with driving.

The same type of drug is used to curb the appetite—and those who are fighting the battle of the bulge often take such drugs. The small doses recommended to curb appetite, if not abused, will have no effect on the central nervous system, hence hyperexcitability and recklessness will not be present.

In the last three or four years another class of stimulants to the central-nervous system, known as anti-depressants, has been introduced in the field of psychiatry. Imipramine (Tofranil®) and amitriptyline (Elavil®) are drugs of this class. They lift the mood of the patient in severe melancholia. These drugs are not capable of producing hyperexcitability, but if they are given and alcohol is ingested, the two will act as synergists and not only will there be hyperexcitability and distortion of the thinking process, but also an impairment of the motor functions of the body. It is clear that driving under these conditions would be hazardous.

We come now to consideration of the antihistaminic drugs. We have had these for about twenty years. These drugs are for the most part anticholinergic drugs, which means drugs similar to belladonna. One is familiar with what happens when the physician refracts the eyes for glasses by instilling a belladonna preparation. It blurs the vision. Many of these antihistaminic drugs will do precisely the same thing, and a blurred vision of course is incompatible with driving.

But, in addition, there is another effect, and that is drowsiness. This is largely individualistic. Certain people can take the antihistaminic drugs—diphenhydramine (Benadryl®), tripelennamine (Pyribenzamine®), and chlorprophenpyridamine (Chlortrimeton®)—and have no drowsiness whatsoever, whereas others have very marked drowsiness, and this of course would add a blurred consciousness to a blurred vision, each of which would be incompatible with driving.

These antihistaminic drugs also have been used as anti-motion sickness drugs, and the outstanding one of these of course is dimenhydrinate (Dramamine®). This, too, is anticholinergic and can produce a certain amount of drowsiness and blurred vision. Two better drugs for this purpose are meclizine (Bonine®) and cyclizine (Marezine®); they produce less drowsiness and less blurred vision.

The psychotropic drugs, or the tranquilizing drugs as most of you know them, are a product of our age. We divide them into two classes: the major ones which are called the antipsychotic drugs, of which chlorpromazine (Thorazine®) is the prototype, and then the so-called minor tranquilizer drugs, which consist of meprobamate (Miltown® and Equanil®), chloridazepoxide (Librium®), diazepam (Valium®), and certain others.

May I state that 80 million people have taken meprobamate, which number is comparable to all of the drivers of motor vehicles in the United States. If you add to this 80 million people who have taken Miltown®, those who have taken Librium®, Valium® and others, you can see that practically everyone who is operating an automobile has at one time or another, even when operating the automobile, taken some kind of psychotropic drug.

What are the effects of these drugs? The minor tranquilizers that are used to quell anxiety, and for daytime sedation, certainly have the capacity to slow the reflex time of an individual. In addition to that they tend to isolate him from his environment, and it is tragic for a person operating an automobile to get dreamy and drowsy and to become isolated from the traffic which encompasses him on the highway.

A few years ago I gave a telecast here in the city on the effect of alcohol on driving. One of my graduate students, Dr. Johnson Ling, was the test subject on the telecast. We set up an experiment in which Dr. Ling was to see a signal representing a car coming along a highway, and then he was to press the foot on the brake and stop the car which he was operating.

It generally took him about three-tenths of a second to do this. He was an uninitiated individual in drinking, and we gave him a long, hard gin and tonic, and then put him through the same experiment. The reflex time was doubled. It took him six-tenths of a second, after he saw the oncoming car on the highway, to push the brake in his car. In three-tenths of a second, going sixty miles an hour, a car can cover 26 feet on the highway—it is a matter of life or death.

The psychometric drugs—like the universal tranquilizer, alcohol—slow the reflex reaction time. Germane to this subject is an experiment which was carried out by investigators in Manchester, England. Some of the finest drivers of motor vehicles in the world operate the double-deck buses in England, and they were given a test in which they were to run a bus between two stakes and see if they could miss these stakes by one centimeter on either side. This is indeed a feat.

Without alcohol they could do this quite well. With alcohol their capacity deteriorated, but what deteriorated more than their skill was their judgment of what they could do and what they could not do. Their judgment of their ability to do this deteriorated far more than their performance of going through the narrow aisle that was set before them.

So it is obvious that the taking of this type of drug or alcohol is also incompatible with driving.

In conclusion, people should take, and physicians should prescribe, drugs that affect the central nervous system only when they are definitively indicated. The patient should be warned against the possibility of the drug affecting the central nervous system adversely, especially when the individual is operating a motor vehicle. One should always bear in mind that the response is individualistic. No one responds in exactly the same way as another to a drug which affects the central nervous system. We look upon these drugs with respect to the operation of a motor vehicle, and must concede that they are like the finger of God: they can heal and they can smite.

Medical Conditions and Driving Ability

ABRAHAM J. MIRKIN

Chairman, Committee on the Medical Aspects of Automotive Safety, American Medical Association

As you can see, the title of my presentation is not one of sterile clinical appearance. It was selected because Mr. Gordon Dalsemer of the National Safety Council thought that we should be addressing our remarks to lay people interested in traffic safety, rather than to physicians. We did not want to frighten off anyone.

I welcome this opportunity to speak to you who are non-medical because the medical profession has all too often been asked to delimit the relationship between physical or emotional factors and the causation of collisions. Unfortunately no aspect of traffic safety has been less clearly defined than how to assess the health status of an

winter 1966

DORSEY Season

A journal within a journal published quarterly in the interests of better medicine by Dorsey Laboratories, a division of The Wander Company, Lincoln, Nebraska. Address communications to Raymond C. Pogge, M.D., Director of Medicine.

this issue: the nose as a shock organ

the nose as a shock organ

by Charles J. Shagoury, M.D., Chelmsford, Massachusetts

"Is it a cold, hay fever, or has he been reprimanded by his boss?" Occasionally, you will ask yourself this question when confronted by a patient with abrupt onset of rhinorrhea, nasal obstruction, and sneezing. Usually the history will elucidate the problem, but examination of the nose will often provide valuable clues to the correct diagnosis.

The nose is a shock organ in a double sense. First, it is in the nose that the confrontation takes place with the surrounding atmosphere. For twenty-four hours a day, the nose must meet the varying challenges of the inspired air, containing perhaps noxious chemicals, dust, dirt, bacteria, viruses, fungi, and industrial pollutants of all kinds, and render it clean, virtually sterile, and fit for the sensitive alveoli of the lungs. Whatever the temperature or humidity of the atmosphere, the nose must transmit it to the lungs at approximately 98°F, and with a humidity of approximately 40%.[1]

Second, in particularly susceptible patients, the nose acts as a shock organ in a manner totally unrelated to its normal function. Persons with hay fever respond to ordinarily harmless materials by extreme nasal congestion, with marked rhinorrhea and violent spasms of sneezing. In some patients, exposure to threatening or disagreeable agents, or situations involving mental conflict may result in a reaction which is exclusively nasal, with swelling of the turbinates, and marked hypersecretion.[2]

Nasal symptoms usually result when the nose seeks to perform its function of getting rid of noxious and dangerous elements in the atmosphere, and prevent their admission to the trachea and lungs. Small particles are removed by the mucous coating which blankets the nasal passages. This mucous blanket contains a bacteriostatic agent, lysozyme, which destroys most air-borne bacteria.[3] The mucinous content renders the surface sticky, causing dusts and small particles to adhere. It has been postulated that this process is rendered more effective through adsorption because of a surface electrical charge on the nasal mucosa.[4] The cilia then sweep the particulate matter to the pharynx. The nose can prevent entrance into the lungs of particles as small as three microns in diameter, but smaller particles elude the nasal barrier. Most bacteria causing respiratory infections are one to three microns in diameter, but since they usually are inhaled in clumps, they are efficiently removed as a rule. Viruses, which are of the order of 1/1000 of this size, are less efficiently dealt with, unless they occur in very large aggregates.[5]

The nose will react in a more or less similar manner, whatever the nature of the offending agent, whether it be an irritant chemical, virus, pollen, or distasteful emotional situation. In acute coryza, the most characteristic sign is a profuse watery discharge. The volume of secretion may rise from practically nothing to nearly 60cc in twenty-four hours.[6] The mucous membrane is reddened and engorged, while the turbinates are markedly swollen. After the first day or two, the secretion becomes thicker, yellowish, and more difficult to expel. The surface cells are largely destroyed, contributing to the copious discharge, which now also contains numerous inflammatory cells which have migrated to the area. Gradually, over a period of a few days, or a week, the flood abates, the swelling and redness subside, and the nasal epithelium resumes a healthy appearance.

Repeated attacks of rhinitis, particularly if there is an underlying element of obstruction, may result in chronic rhinitis. The mucous membrane is constantly swollen and reddened. Sticky, mucopurulent secretions are a continuous feature, and the glandular elements are hypertrophied. Commonly, the mucosal surface takes on an irregular, rounded "mulberry" appearance, and nasal passages are occluded by the swollen turbinates and redundant mucosa.

While all of us are susceptible to colds, the victim of hay fever, or allergic rhinitis, displays a marked nasal reaction to materials in the air which leave his associates unaffected. In such a patient, the nasal mucosa has become an allergic "shock" organ. Contact with the nasal allergen causes local release of histamine, with vasodilatation, increased vascular permeability, and severe nasal congestion, similar to the "wheal" and "flare" reactions in the skin, when the epidermis is the allergic shock organ. While we eagerly await the coming of spring, the hay fever sufferer dreads the blooming season, whose invisible pollens are poisons to his sensitive nose. His neighbor's cat or dog may provoke paroxysms of uncontrollable sneezing. In some cases a specific allergen is not identified, but the triad of rhinorrhea, nasal obstruction, and sneezing is present.[7] The nose in these cases shows a pale, boggy, edematous mucosa, with a thin mucoid secretion. The mucous membrane shows extreme retractility to 1% cocaine or ephedrine. If the patient has medicated himself prior to examination, the nasal passages may appear abnormally patent, or show exaggerated congestion due to rebound reaction. The secretion may show a large number of eosinophils particularly after an attack of sneezing or rhinorrhea. Touching the mucosal surface, especially of the inferior turbinate, leaves an indentation, showing that the swelling is due to stasis and edema, rather than actual hyperplasia of the mucous membrane as in chronic hypertrophic rhinitis. Though the pale swollen mucosa is the hallmark of allergic rhinitis, as usually seen by the physician, exposure of allergic subjects to their known allergens results in a brief hyperemic phase, followed by pallor and edema.[8]

In the later stages of allergic rhinitis, the chronic edema of the mucous membrane results in the formation of polyps, clusters of grape-like masses hanging from the roof of the nose, with a pale glistening surface, contributing significantly to the sense of nasal obstruction and oppression.

A large group of patients show symptoms of nasal congestion when confronted by adverse life situations.[9] In these unfortunate persons, anxiety, frustration, and resentment are often accompanied by a runny nose and nasal obstruction. Lacrimation adds to the nasal stuffiness. This autonomic response, mediated by the parasympathetic nervous system, may be part of a general parasympathetic reaction, or may possibly represent in part, a symbolic effort to wash out and crowd out the offending situation.

Nasal congestion may also occur in some patients at times of sexual stimulation, and in women during menstruation and pregnancy, even to the point of epistaxis.[10] The relationship is obscure; castration results in atrophy of the nasal glands, and their action is inhibited by the hormones of the hypophysis and the thyroid.[11] The nose may be the shock organ in drug therapy. The nose may also bear the brunt of industrial stress, in those who work in a hot dry atmosphere, or those exposed to acid fumes, or irritating dusts. As the air in our cities is increasingly polluted by exhaust fumes, and industrial irritants, whole urban populations may suffer from chronic nasal and respiratory symptoms.

Of course, nasal reactions are not just infectious, or allergic, or emotional. Particularly in the chronic sufferers, there is an interdependence of all three. Death of a relative, or other psychic shock can pre-

(concluded on following page)

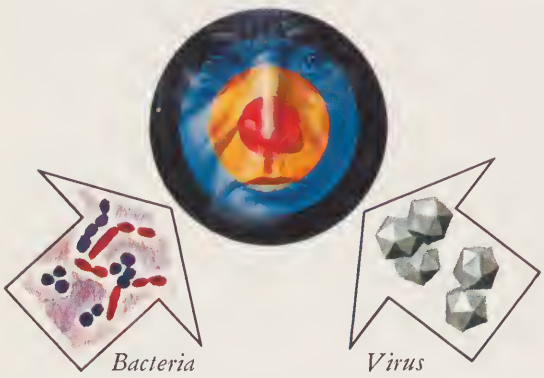
it's a comforting thing to know

For postnasal drip, clogged ears and stuffed and runny noses

Triaminic® timed-release tablets

Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.



keep patients comfortable 'round the clock. 24-hour decongestion on just a single tablet dosed morning, mid-afternoon and at bedtime. Patients regain senses and can breathe, smell and taste again.

Triaminic. Isn't that a comforting thing to know?

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

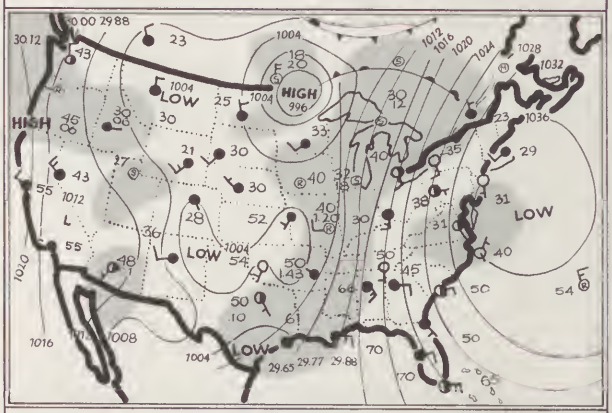
cipitate an attack of rhinorrhea in hay fever sufferers.[12] Others develop attacks of vasomotor rhinitis following change in temperature, chilling, or exposure to the sun, or simply warm bedclothes.



The complex interplay of allergy and infection is largely unclear. Allergy to the viruses and bacteria which cause infection has been postulated, but is difficult to demonstrate. The swollen obstructed allergic nose is more susceptible to infection. At the same time, infection often precedes or precipitates an allergic attack. Exposure of a susceptible patient to an allergen can activate latent virus organisms leading to infection.[13] This "jolt" reaction represents a summation of an allergen and a virus leading to symptoms in the nose as a shock organ, which neither could have produced alone. In childhood, repeated attacks of bronchitis and colds may be inflammatory reactions to an allergen, or precipitated by exposure to an allergen. These children may later develop typical allergic rhinitis. On the other hand, children with typical allergic histories, eczema, asthma, and allergic familial backgrounds, may later develop typical infectious rhinopathies. Skin tests in such patients are usually positive.

Nasal reactions are part of the systemic response of the patient to an unwelcome stimulus. In cases of respiratory infection and exposure to atmospheric irritants, the reactions are useful, and to some extent desirable. They are usually self-limited, disappearing within a few days, or upon removal of the provoking agent. Here the distressing symptoms can be ameliorated with appropriate decongestant agents, or, in the case of severe or complicated respiratory infections, antibiotics may be given, with reasonable confidence of a cure. On the other hand, when nasal reactions are the peculiar response of an individual to an allergen, or to an undesirable situation, they serve no useful purpose. The nose here is a shock organ in a stressful situation, but can furnish no response of value. It merely causes the patient symptoms which add to his problems. In these cases, symptomatic treatment is of great benefit, but often the underlying faulty pattern of response cannot be altered. Such a patient may literally be considered to be paying his way in life "through the nose."

Weather Forecast Throughout the Nation

RAIN TURNING TO SNOW, INCREASING WINDS AND DROPPING TEMPERATURES FOLLOWED BY COUGH, CONGESTION AND PAIN

Tussagesic® provides up to 24-hour coverage of the tough cold with a single timed-release tablet dosed morning, midafternoon and at bedtime. Coughs are broken up, runny and stuffed noses are cleared and pain is relieved.

Each Tussagesic® timed-release tablet contains:

Triaminic® (phenylpropanolamine hydrochloride 25 mg.; pheniramine maleate 12.5 mg.; pyrilamine maleate 12.5 mg.)	50 mg.
Dextromethorphan hydrobromide	30 mg.
Terpin hydrate	180 mg.
Acetaminophen	325 mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: Patient should not drive a car or operate dangerous machinery if drowsiness occurs. Except under professional care, do not give to patients under 12 yrs. or those who have persistent cough, high fever, heart or thyroid disease, hypertension or diabetes or use for more than 10 days.

individual authorized by law to drive.

As we all know, driving is a complex task. As a matter of fact, the complete study of how complex it is has yet to be concluded. But, in brief—and this will be very brief, it consists of the sensing of numerous, sometimes fleeting factors; sorting them in order of significance, in very, very short periods of time; and making a decision which requires just as complex a motor response in order to control effectively the vehicle one is driving.

This takes place in terribly short moments. It has been estimated that every mile of driving on a highway entails twenty to sixty decisions. We do not think of it broken up that way, but we are constantly being bombarded with information through our senses. We are trying to use our brain, the cortical part as Dr. Krantz expressed to you, (1) to determine which of all the factors we sense are the important ones in making a judgment, and then, having made the judgment, (2) to make the proper maneuver to control the car effectively and prudently.

I shall try to separate some of the fact from the fancy and to dwell more on the logic and knowledge we have rather than on the lore that has come down through the years. I shall try to point out that the driver's task is modified by illness, by injury, by emotion and even by the treatment of these things, as indicated by Dr. Krantz just a few moments ago.

It is only in very recent years that significant statistical information has been obtained which permits the making of some definite recommendations by the medical profession.

The driving ability of an individual is definitely modified by any alterations in the physiological, the psychological, and the pathological conditions which influence that driver at any particular time.

These three P's are terribly important in the consideration of today's presentation: *Physiological, Pathological,* and *Psychological.*

In brief, and in lay terms, physiological factors are those having to do with the ability of the individual to function or to perform. There may not necessarily be a physical disease present when there is an alteration in a physiological factor.

Psychological factors are those which modify the ability of an individual to control his car because of his emotional reaction to a situation, to his environment, or to his illness.

Pathological factors are those due to disease or injury or other disability, either acute or chronic, which interfere with the individual's ability to sense, to sort, or to respond in such a prudent way as to be in control of his vehicle.

I shall touch on each of these three main categories, but will restrict myself to points which are supported by scientific or statistical evidence.

Probably no **physiological** factor has been studied more extensively over a longer period of time than fatigue. It has been well documented that with fatigue comes inattention, inability to sense all of the environmental changes, slowness in sorting out information received by the brain, and loss of active coordination in effecting the proper response.

As was just pointed out by Dr. Krantz, the use of amphetamines, or to a lesser degree some of the other stimulants, may not only be insufficient to overcome the deleterious effects of fatigue, but may also introduce some other undesirable effects from the drugs themselves, and such added effects may further impair the ability of one to drive.

A little less known, but equally well documented by now, is the effect of carbon monoxide concentration in the blood. It can impair attentiveness, perceptiveness, particularly at night, and may also interfere with motor coordination. Dizziness, lethargy, and sleepiness easily obtain with carbon monoxide elevation in the blood as they do with fatigue.

Most of us think of carbon monoxide concentration in the blood in relation to a poor exhaust system, a leaking of CO through the floor of a car, with this insidious, odorless, tasteless gas creeping in and overcoming the driver. Fortunately, this does not happen very often.

In addition to getting a higher concentration of carbon monoxide in the blood than is normally present through a leakage in the exhaust system, it is surprising how much carbon monoxide gets into your car while it is standing in traffic and your ventilator system is inhaling the exhaust fumes of the car right ahead of you. But even less well known is the fact that smoking, either by the driver or by occupants of a car when it has all the windows closed, has an even more significant deleterious effect.

It has been substantiated that the rapid smoking of three cigarettes in a closed car will alter the ability of the red part of the blood (hemoglobin) to combine with oxygen, to the same extent as being suddenly transported to an elevation of

8,000 feet. Hemoglobin, the oxygen-carrying part of the blood, is easily displaced by carbon monoxide, and it is much more difficult for the body to break up that combination of carbon monoxide and hemoglobin than it is to break it up oxygen alone combined with hemoglobin. So the effect of a certain amount of carbon monoxide is to cause what we call anoxia; and with anoxia come dimunition in visual acuity and impairment of judgment.

No one has any accurate figures about how significant such an association is in accident or collison causation, but the figures that have come out of California in the last few years indicate that several percent of fatal accidents revealed carbon monoxide concentration in the blood immediately after death. I might point out that taking blood-carbon monoxide is much more difficult than taking blood-alcohol. Carbon monoxide is very rapidly broken down when exposed to air; you have to take the blood sample under oil, so that no oxygen gets to it, and it must be done within a matter of minutes after the victim is brought in. It may contribute to a collision, but I can not give you exact figures.

Another physiological factor which may influence driving is age. We all hate to talk about age, but I am sure you have noticed how many people who get past sixty-five dislike driving at night, and there is a physiological explanation. As we get older our ability to see at basal level, what is called threshold vision, deteriorates. For every thirteen years we age we need twice the amount of illumination we did before. This explains why the older person may have to be restricted from driving at certain times of day, usually dawn or dusk when light intensity is poorest.

In addition to the loss of visual acuity that comes with age, at increments of thirteen, the recovery from glare diminishes or deteriorates as we get older. This is why many drivers who are quite competent during the day complain about the glare of oncoming headlights at night. Their seeing mechanism, to put it bluntly, does not respond, does not recover from that terrific glare which hits them, and they are momentarily blinded immediately after that glare has gone by, whereas a young person recovers much more quickly.

Another thing which many of us had not known before, but which has been documented recently, is that placing a piece of plate glass—and I am talking about plate glass because there is no distortion theoretically—between the outside and the driver of the car diminishes visual acuity both in young and in old. If that windshield made of plate glass is tinted, it affects visual acuity loss even more, particularly if the driver is in the older age group.

This ability to distinguish objects, to distinguish colors, to distinguish movement, is materially reduced with a tinted windshield over plain windshield, but even plain windshield causes some loss of visual acuity.

Many of you have heard about red-green color blindness and what it must do to the skill of the driving person, but statistically this has not been borne out. Red-green color blindness, which is mostly prevalent in males, and which is much more common than total color blindness, has no significant effect on driving ability as long as the red-green signals are in the same relative positions on the signal pole—in other words, as long as the red light is above the green light, and as long as the intensity of hue of these two prime colors is significantly different.

Another sense which we used to think was important in driving skill is hearing. But it has been shown, especially in modern society, that when we are all trying to screen out the extraneous sounds around us (and this goes on even when we drive), we depend more and more on our vision and less and less on our hearing. Hearing itself is therefore not too significant a physiological factor in the causation of a collision.

A good statistical summary was presented about two years ago by a jurist, I think in Colorado. When he investigated two hundred deaf drivers in the state, he found their driving records over a significant period of time were much superior to the driving records of the rest of the citizens of that state.

The next group of factors are the **psychological** ones or, in lay terms, the *emotional* factors, and they do play an important part in accident causation. It has been borne out by excellent studies made at Harvard Medical School, at Northwestern University, and in other centers throughout the world, that aside from the abuse of cars by obviously agitated, aggressive, or mentally disturbed patients for suicide or homicide—and automobiles have been used for those purposes—that "factors of attitude, personality, and adjustment

are of greater importance to safe driving than sensory defects, reaction times, or psychomotor skills."*

Among the examples usually given of such factors are those involving the individual who has had a fight with his wife just before he goes off to work in the morning; the one who is tense about taking a final examination later that day; and the individual who is depressed over a serious illness of someone close to him. The driving of such individuals leaves much to be desired when they are emotionally roiled by such factors.

Furthermore, it is well known now that the driver accentuates his usual emotional makeup or, as was stated a few years ago by Dr. McFarland, "One drives as one lives."

In all probability the causation of many, if not most, of the collisions which take place every day may well be associated with emotional or psychological factors causing loss of competency to drive. Until now, however, no effective or efficient screening test has been devised to identify such drivers and keep them off the road even for short periods of time. It is even more distressing that many chronically agitated or otherwise disturbed individuals, who have successions of accidents, cannot be effectively kept off the highways.

Until recently, chronic medical conditions were thought not to have a significant statistical association with traffic collisions, especially if they had been identified, treated and compensated for. In October, 1964, Dr. J. A. Waller of the California State Department of Health for the first time reported at the annual meeting of the American Association for Automotive Medicine that certain chronic medical conditions, at least in California, were associated with an increased incidence of traffic collisions.

He said, "Drivers with diabetes, epilepsy, cardiovascular disease, alcoholism and mental illness averaged twice as many accidents per million miles of driving, and 1.3 and 1.8 as many violations per hundred thousand miles as did drivers in a comparison group on an age-adjusted basis."

He added that the accident rates of drivers with medical conditions were further increased when they were over sixty years of age, had a poor attitude toward driving, or had a past history of an accident or violation related to the medical condition.

But Dr. Waller wisely warned that: "Since the present study is limited to drivers whose medical conditions were known to the California Department of Motor Vehicles, caution is urged in assuming a similar degree of driving handicap in unreported drivers with the same conditions."

In an even more recent review, dated November, 1965, Dr. Erma West, also of the California State Department of Health, investigated some eight hundred consecutive cases in a two-year period, in which death occurred within fifteen minutes of impact in an automobile collision. Dr. West recorded, "Drivers who died from natural causes just before their accidents constituted approximately 10% of the cases." This is the highest recorded validated report I have seen. Some of the literature from the Scandinavian countries, particularly Norway, is at the other extreme. Their reports indicate that very few collisions are due to medical conditions that precipitated death just before the collision. But I wonder whether they investigated and autopsied every driver as Dr. West's department did in California.

The 10% of the eight hundred were, for the most part, middle-aged or elderly men over forty; and most of them had suffered a coronary occlusion, which is a heart attack. A few had associated severe diabetes; and one had a massive blood clot of the lung which was due to hardening of the arteries.

Dr. West suggested that male drivers over forty years of age who are dead on arrival after an automobile collision, no matter how severely injured, should be autopsied to determine if a natural cause of death occurred prior to the accident. She further recommended that "Additional consideration should include placing heart disease on the list of conditions physicians must report to the State for purposes of determining fitness and requiring applicants for operator's licenses, and permits and renewal, to report heart disease along with the already reportable conditions on their application forms."

Acute medical conditions, due either to illness or to injury, may probably be more related to temporary driving impairment, and therefore accident causation, than the chronic illnesses mentioned before. It seems rather obvious that an application of a leg cast, or an arm splint, or a patch over an inflamed but otherwise normal eye, will certainly cause more impairment than the long-standing loss of a comparable member in a driver who had learned to compensate for the

*Ross A. McFarland, MD, Harvard School of Public Health.

loss. Certainly, the medications used in the treatment of these acute medical and surgical conditions may themselves increase the degree of driving impairment.

Physicians must be made to feel responsible for warning their patients about driving when such acute conditions are treated by appliances and restricted dressings, as well as by drugs.

It is because of the possible deleterious effects of medications that self-medicating patients must be advised that a cold remedy containing an antihistamine, purchased over the pharmacy counter, may be just as harmful to his driving ability as one prescribed by his physician. But the responsibility for his taking this medication and driving must rest with the driver, if he is involved in a collision. This is the same responsibility he assumes when he drinks alcoholic beverages and continues to drive.

I never heard counsel in a courtroom defending a client who had been involved in a collision associated with his drinking, state that the alcohol had impaired his driving. But I have heard counsel say that the reason his client was in a collision was that he took a medication. Now I think one is almost as foolish as the other, except that up until now there has not been sufficient publicity given to the ill effects of taking certain medications, either from a doctor or from the pharmacy, on driving ability.

Finally, I have been asked many times about the importance of a complete physical examination in discovering medical conditions which may impair driver competence. Surprisingly enough, in my considered judgment, it is not important at all. A very small percentage of physically disqualified drivers would be removed from the rolls if this were done; and, as was hinted before and pointed up, particularly in Pennsylvania's experiment, there are not enough physicians to spend as much time as is necessary for a decent examination on every driver applicant or every renewal candidate.

This is not to say that a physical examination for the purpose of making a clinical diagnosis is not important to the patient, but one must remember that very often it is only a symptom which impairs his driving and not necessarily a disease or illness. A physical examination would be ideal at the time of an applicant's original request, regardless of how old or how young he is at that time, but if it is impractical—and I feel it is in most states—then it should be done whenever there is an obvious physical or emotional impairment in the applicant.

Such original physical examinations would provide a base line against which renewal requests might be compared. At such times, the driver should be required to attest to his freedom from any defect or disability developing since that first physical examination. If he has developed such a condition or defect, the physical examination should be repeated and, to keep the renewal applicants honest, he should be made to appear before a representative of the Motor Vehicle Administrator in person, rather than to request his renewal by mail, such as is the case in this state now.

There are over 96 million licensed registered drivers in the United States. As I mentioned before, there are not enough physicians, even if they were to give up all types of practice, to do physicals on these.

In addition to the base line physical that I mentioned before, there are three occasions when a physical examination should be done.

It should be mandatory whenever a driver has been involved in multiple accidents within a short calendar period of time, without awaiting adjudication of fault. This is the experience that has led the State of Kentucky to have its law changed to read that three collisions within two years requires a physical examination of the involved driver.

Secondly, it should be required whenever a driver must be placed in the "assigned-risk pool" for insurance underwriting purposes, because commercial carriers have refused to assume the risk. This of course eliminates the driver who, because of youthfulness alone, is put in such a pool.

Thirdly, the physical examination must be done when the driver voluntarily suggests he "blacked out" or blames his mishap on a medical condition.

Drivers, their physicians, law enforcement personnel, motor vehicle administrators and their licensing staffs must be kept informed of the effects of physiological, psychological and pathological factors in determining driver limitation, especially as new information is developed. If physicians are protected by law whenever they are required to report medical information about their patients to a State Motor Vehicle Administrator, or better yet, to his Medical Advisory Board, this one aspect of driver limitation and its control will improve.

Legal Problems Involved in the Development of Legislation

J. DUDLEY DIGGES
Chief Judge, Seventh Judicial Circuit, State of Maryland

The legal profession is vitally interested in the problem that you are undertaking to discuss here today. We are interested in it for several reasons, among them a selfish one: I am now serving as chairman of a committee composed of the chief judges of the State and concerning itself with the backlog of cases that have accumulated in Maryland.

As of September 1, there are some 74,000 cases pending in this state. Of those cases that are triable, a good 85% are concerned with motor vehicle accidents, and the damages and injuries that have occurred as a result of them. When you figure that a judge can try only approximately 125 cases per year, and there are only 70 judges in the state, you can see the problem that that in itself causes.

I may say that Maryland is extremely fortunate in comparison with New York City, which is some five years behind in taking care of the trial of cases, with great financial hardships not only for the victims, but indeed for the medical doctors who have performed services, who should be paid, and who should not have to wait for some five years to be paid.

You can see we are going to have a breakdown in the judicial processes that can be serious, because really this is the backbone of operation of a civilized society. And so I readily accepted the invitation to appear here today. It is important that we do everything both in and out of the medical field, both in and out of the legal field, and indeed both in and out of all fields, to attempt to solve this problem, which is becoming such a menace all over America that it would not surprise me if someone suggested the only answer to it was to outlaw the automobile itself. That might seem drastic, but nevertheless we cannot go on in the manner in which we have been going. The legal profession is looking for other methods to settle the disputes so that the general machinery of the courts as we now know it can continue to function and not be clogged.

But we all must recognize that whatever solution is attempted must come within the framework of what we have learned in this country to call constitutional privileges, constitutional guarantees, which cannot be cast aside, no matter what the reason. The reason I say that is simply because the American people will not stand for anything short of these guarantees because they are so far-reaching. It is within that framework that I want to discuss today, not of course from the medical point of view, but from the legal point of view, the absolute minimum with which we must concern ourselves.

First of all, I must say that the answer to what meets the constitutional requirements depends largely upon developments in the medical field. That is not only true in this field; it is true in many others.

Within the last six months I presided over a case involving the constitutionality of Patuxent Institution. From a constitutional point of view, the whole case turned on the question of whether or not the medical profession had progressed in its discoveries and development to such an extent that there was reasonable unanimity among physicians as to what can be accomplished in an institution like Patuxent.

I spent a whole week—some 8,000 pages of testimony—dealing with this question. The testimony was largely from doctors, such people as Dr. Karl Menninger and other experts in this field, so that it could be determined whether you medical folk had reached the state where the law can be based on sound principles.

The number one requirement here is that the statistics you gather, which show, for example, that a certain percentage of alcohol in the blood destroys the effectiveness of a driver, be a reasonable basis for a decision. This can be determined

only by you in the medical field and by those associated with you.

As I mentioned at the outset, from a legal point of view the problem goes back to the concept that the driving of a motor vehicle is a privilege and not a right. Just how long that concept will continue in effect I do not know, but when it changes, and it is determined that driving is a right rather than a privilege, then all of the decisions of the law that have been made or suggested will go down the drain along with the present concept.

A change may come as we in this country become more and more dependent upon the automobile for our livelihoods, for our use almost every time we turn around. It may be that one of these days it can be so wound up in our daily lives that the operation of a motor vehicle will be deemed a right, guaranteed by the various provisions of the constitution, and not a privilege.

Meanwhile in today's law we deal with this as a privilege, a privilege which is granted to an individual, but which may be withdrawn, provided of course that the reason for withdrawal meets other constitutional tests, and provided that all in the same category are treated alike.

It is within this framework that some of the proposed laws are referred to as the "implied consent" laws. They are now on the books in a number of states, among them New York, Idaho, Kansas, Utah, North Dakota, South Dakota and Vermont.

The concept of driving a car as a privilege was adopted by the National Conference of Commissioners on Uniform State Laws in 1957, and approved by the American Bar Association in the same year.

Briefly, the law provides that anyone who applies for an operator's permit and who uses that permit to operate on the highways of the state, impliedly consents to a test to determine whether or not he was driving under the influence of alcohol and to the withdrawing of blood, providing it is done by a doctor, a qualified technician, chemist, registered nurse or someone in an allied field.

If the person does not agree—and he has a complete option to agree or not to agree—his operator's license is automatically withdrawn.

If the person is incapable of consenting or agreeing because of death or some other reason, then the doctor has the absolute right, at the direction of the proper authorities, to proceed to draw the blood in order to make the test.

The law then specifies—and this must be based on medical conclusion, with reasonable unanimity among your profession—what degree of alcohol, in what category. Of course the law would have to be changed if you made discoveries which changed your conclusions.

The test that is set forth is for five hundredths of one per cent of alcohol in the blood, by weight. At that point the person is still deemed accountable. Then it goes on up until such time as there is a prima facie presumption that he is too intoxicated to operate a motor vehicle.

Without going into the advisability or the nonadvisability of the passage of that law—and most people who have made studies of it believe it is a very desirable law—there are many other laws that could be considered.

For example, there could be a law based not on *implied* consent, but on *affirmed* consent and requiring the individual to sign the consent in order to get a license. That has its drawbacks, however, because out-of-state drivers in a state with such a law may not be subject to it in their home states and implied consent would be applicable to them.

There is one case that I want to call to your particular attention. This is a very recent case that came as a surprise to me, in view of the various trends of the Supreme Court. It was decided just last June—June 20, 1966. I think it has a great bearing on this problem.

The case was one that arose in California (Schmerber vs State of California). The defendant was initially convicted in the Los Angeles Municipal Court for driving a motor vehicle while under the influence of intoxicating liquor. After the defendant's arrest, while he was in a hospital receiving treatment for the injuries suffered in the automobile accident, a blood sample was withdrawn by a physician at the direction of the police officer, acting without a search warrant, despite the defendant's refusal on the advice of his counsel, who was present, to consent to the blood test.

The report of the chemical analysis of the test, indicating intoxication, was admitted in evidence at the trial over the defendant's objection that the compulsory blood test, and the admission of the evidence thereof, violated his right to due process of law under the Fourteenth Amendment, and his

privilege against self-incrimination under the Fifth Amendment, his right to counsel under the Sixth Amendment, and his right against unreasonable searches and seizures under the Fourth Amendment, insofar as such rights were secured against the states by the Fourteenth Amendment. So the whole gamut of constitutional objections was raised in this case.

Amazingly enough, the Supreme Court upheld the decisions of the California courts five to four. I say "amazingly enough" because the tendency had been five to four the other way up until this case. Justices Warren, Black, Douglas and Fortas dissented very vigorously, but the majority of the Court answered all of the constitutional objections, and briefly I will tell you the basis upon which they agreed.

They decided that the defendant was not deprived of due process of law because there the withdrawal was made by a physician in a simple, medically acceptable manner in a hospital environment. They put it right back in the laps of the medical profession to make a determination as to whether he was being subjected to anything that did not represent justice and fair play.

If it is a medically accepted method, then apparently that would meet the argument that there was not due process of law, as enunciated by the Supreme Court in this case.

The more troublesome problem comes under the Fifth Amendment of the Constitution which guarantees any defendant the privilege against self-incrimination. When this defendant submitted to the taking of his blood, it was argued that he was thus required to give evidence against himself, which of course was made unlawful long ago when the Magna Carta was extracted from King John of England.

The Court denied that contention in these words: "It could not be denied that in requiring petitioner to submit to the withdrawal and chemical analysis of his blood, the state compelled him to submit to an attempt to discover evidence that might be used to prosecute him for a criminal offense. He submitted only after the police officer rejected his objection and directed the physician to proceed."

That language is of peculiar importance to doctors, I would think, because the proceeding was at the direction of the police officer and over the objection of the defendant.

The Court said: "The officer's direction to the physician to administer the test over petitioner's objection constituted compulsion for the purposes of the privilege. The critical question, then, is whether petitioner was thus compelled 'to be a witness against himself'."

The Court answered that by saying: "History and a long line of authorities in lower courts have consistently limited its protection to situations in which the state seeks to submerge those values for obtaining the evidence against an accused through 'the cruel, simple expedient of compelling it from his own mouth'." Implicit, no doubt, was that this would apply to all things. The Court laid stress on the fact that the drawing of a little blood was of a very minor nature and akin to compelling a man to submit to a fingerprint test. It intimated that pumping the stomach, or something of that nature, would not be a simple thing such as we are dealing with here.

"In the present case, however, no such problem of application is presented. Not even a shadow of testimonial compulsion upon, or enforced communication by, the accused was involved either in the extraction or in the cehmical analysis. Petitioner's testimonial capacities were in no way implicated; indeed, his participation, except as a donor, was irrelevant to the results of the test, which depend on chemical analysis and on that alone."

The next question was the one related to the Sixth Amendment, his right to counsel. The Court quickly disposed of that by saying you cannot argue that he was deprived of counsel just because counsel was not permitted to have him do what he wanted to do; that if he couldn't claim the privilege himself, he couldn't do it by a law; and if a lawyer advised him not to submit to it, he was erroneously advised.

The next question was under the search and seizure procedure of the Fourth Amendment. The Constitution there guarantees everyone's freedom from having anything seized from him—papers, house search, person—without a warrant.

You will note the case was without a warrant and, as a matter of fact, the man had not been charged, and the officer was merely determining whether there was sufficient evidence to charge him.

The majority of the Court rejected that proposition and said: "The interests in human dignity and privacy which the Fourth Amendment protects forbid any such intrusions on the mere chance that desired evidence might be obtained. In

the absence of a clear indication that in fact such evidence will be found, these fundamental human interests require lay officers to suffer the risk that such evidence may disappear unless there is an immediate search."

But, they said, when there is probable cause to believe that the person may be guilty of the violation of this law, that in itself was justification for the officer requesting the examination over objection, and that if there exists probable cause—and they gave as examples the smelling of alcohol on his breath, the way the vehicle was being operated, the result of the accident itself—those things in themselves can be taken into account; that if there was probable cause to believe he had too much to drink, that was justification for the arrest, and when there is an arrest, anything that may be found on him and used in this respect could be used.

"The officer in the present case, however, might reasonably have believed that he was confronted with an emergency"—and the Court laid great stress on the fact that the medical profession had concluded that the longer you wait after an accident to make this test, the more inaccurate it may be—as reflecting on the true situation at the time. Relying on that, they said, he was justified in acting quickly.

I mention this case particularly because for the first time there is a good indication from the Supreme Court that maybe the machinery exists now for doing a whole lot that we did not think could be done. It is not merely a question then of dealing with a driver's license; even in a criminal case (which this was) where the man's liberty might depend upon the result, these constitutional guarantees do not prohibit the taking of blood as it was taken in this case. And, as far as I know, it is the generally accepted way and not peculiar to the case in question.

But it is a serious problem. I am not suggesting that we do not need further legislation. I am suggesting that maybe the time has come to utilize all facilities. The reason is simply this: fundamental in the American Constitution is the right to trial by a jury. Maybe you would and maybe you would not be amazed at the reluctance of juries to convict people of driving under the influence of liquor.

I admit times have changed, but I remember the first year I was out of law school. I tried before one jury 15 driving-under-the-influence-of-liquor cases, and was successful in having 15 of them found not guilty. This was no great feat on my part; juries would not convict anyone. They are reluctant to do it today, simply because they figure there is a great possibility that "I could be sitting in that defendant's chair."

Therefore I think it is important that we deal with the criminal problem (we have the machinery now, apparently, to do it with the constitutional limitation) and that we also go one step further and consider the desirability of abolishing most motor vehicle laws as being violations of the criminal laws.

I admit that sounds rather drastic, but let me explain. Among my duties, I sit in juvenile court, and I have young people before me who are charged with all kinds of things—not necessarily motor vehicle charges. As a matter of fact very few motor vehicle cases come to youth court. I can tell a boy I am going to send him to training school for six months and get no reaction, but as soon as I tell him I will take his driver's license, and give it to the State's Attorney to be returned to the Commissioner of Motor Vehicles, an eighteen-year-old boy will start to cry.

So I think the way to deal with this problem is to withdraw the individual's privileges when the law has been abused. There should be a simple process to determine that *without* submitting a case to a jury or anyone else.

I realize there have to be certain fundamental safeguards, but we have them now in various boards. As a matter of fact, the Commissioner of Motor Vehicles passes on the question of whether or not the license is to be withdrawn after a conviction. I do not think it should be necessary to impose conviction there. If he abuses this privilege, withdraw the privilege and, similarly, if he abuses privileges of hunting because he shoots too many ducks, withdraw the privilege until he demonstrates a sense of responsibility in that area.

I say that the thing is getting beyond the capability of the courts to deal with in its many facets. It has other ramifications. I agree that people's jobs are at stake, feeding families is at stake—so are welfare departments, all agencies. As a matter of fact, modern life itself is concerned with this whole problem, but I don't think it is insoluble. I think the constitutional limitations do not prohibit a sane approach to the problem which can rectify the whole situation.

New from Du Pont

Symmetrel®

(Amantadine HCl)

The first oral chemical virostat for the prevention of influenza A_2

Influenza virus
Protein shell enclosing the core of nucleic acid (RNA)—artist's representation

The incidence of influenza A_2. In this country, where influenza is one of the leading causes of morbidity, influenza A_2 (Asian) continues to be a serious medical problem. In 1957 influenza A_2 was responsible for approximately 40,000 excess deaths in a three-month period. Since that year the most prevalent influenza virus has been A_2 (Asian).

What is Symmetrel®? "Symmetrel" (amantadine HCl) is a new synthetic chemical which acts as a molecular barrier to virus penetration. It provides for the first time specific oral medication for the prevention of respiratory infections caused by influenza A_2 (Asian) viruses—an entirely new approach in preventive medicine.

For prescribing information, see last page of this presentation

What Symmetrel® (amantadine HCl) means to you

...the first and only oral chemical agent to prevent influenza A_2 (Asian).

...not a vaccine or antibiotic, but a new synthetic chemical unrelated to any other chemotherapeutic agent.

...unique mode of action: prevents virus penetration of the host cell without affecting vital cell functions.

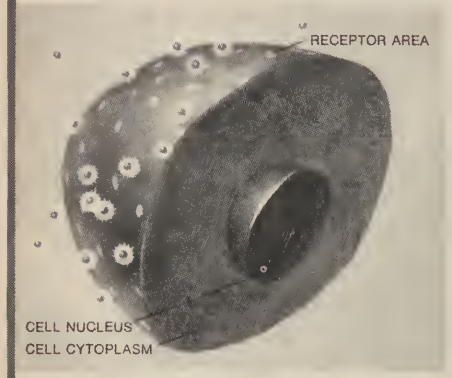
...specifically active against all influenza A_2 viruses tested to date.

...not indicated for the prevention of influenzal or respiratory illness other than influenza A_2 or for the treatment of established disease.

...does not interfere with normal antibody response; acts in concert with pre-existing antibody.

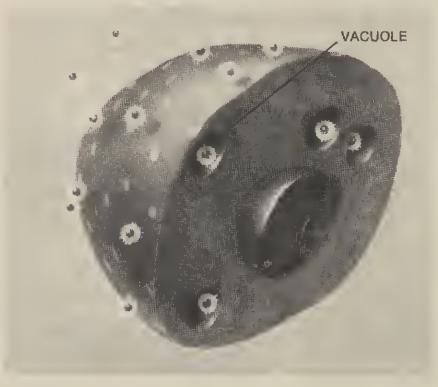
What Symmetrel® means to your patient

...possible immediate influenza A_2 protection when taken following suspected contact.



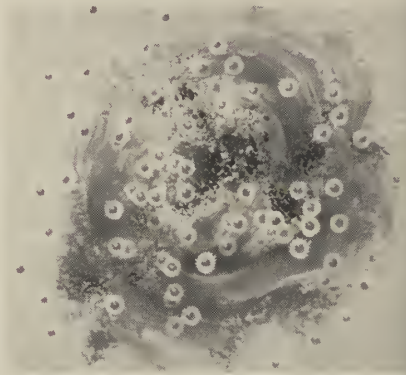
...may be particularly useful during outbreaks or epidemics and for high-risk patients in whom the occurrence of influenza A_2 is especially hazardous.

...a high degree of safety in clinical use.



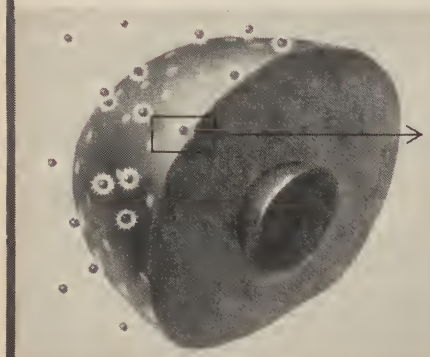
...simple once daily or b.i.d. dosage.

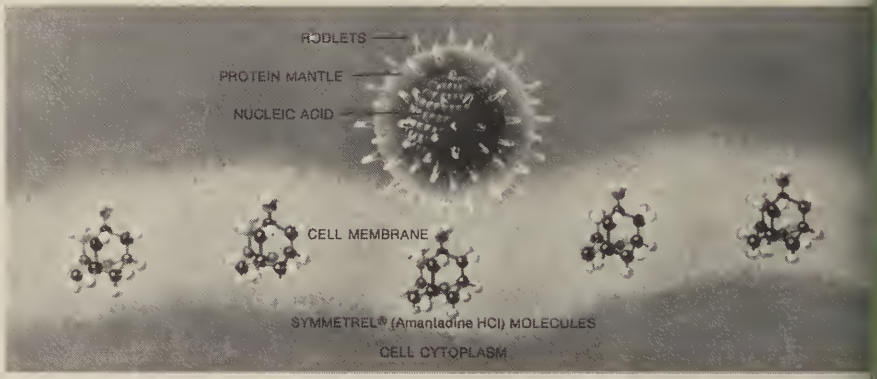
The mode of action of Symmetrel®



How the influenza virus invades and destroys the untreated cell

1 Viruses outside the cell attach themselves to specific cell receptor areas





2 The virus is incorporated into a vacuole within the cell. From this vacuole the virus nucleic acid passes into the cell cytoplasm

3 The virus nucleic acid then directs the cell to produce both new virus nucleic acid and virus protein coat material which aggregate to form new virus particles. This process leads to the release of new virus particles and eventual destruction of the cell

How Symmetrel® (Amantadine HCl) prevents virus invasion[1]

Our current knowledge leads us to believe "Symmetrel" acts as a molecular barrier to influenza virus penetration. Shown here in a greatly enlarged section, "Symmetrel"—located at the cellular membrane—effectively prevents (blocks) virus penetration. Thus, "Symmetrel" does not directly destroy the virus particle but acting as a virostat prevents the cycle of virus penetration, virus replication, and cell destruction that is characteristic of virus invasion of animal cells (tissue). *Artist's conception based on current scientific knowledge.*

1. "Mode of Action of the Antiviral Activity of Amantadine in Tissue Culture", Hoffmann, C. E.; Neumayer, E. M.; Half, R. F.; and Goldsby, R. A., Journal of Bacteriology *90*,623 (1965).

Safety of Symmetrel® Confirmed. When used as indicated, is generally well tolerated. No kidney, liver, bone marrow, or hematological disturbances have been observed.

Prescribing Information

Indications: "Symmetrel" is indicated for the prevention (prophylaxis) of influenza A_2 in persons of all age groups. Early use is recommended, preferably before or as soon as possible after actual or suspected contact with individuals suffering from influenza A_2. "Symmetrel" should especially be considered for high influenza-risk patient groups such as those suffering from chronic debilitating diseases and elderly persons.

Contraindications: Not indicated for the prevention of influenzal or respiratory illness other than influenza A_2 or for the treatment of established disease.

Warnings: Administration to patients with central nervous system disease, particularly geriatric patients with cerebral arteriosclerosis, and patients with a history of epilepsy or other "seizures," requires strict observation for possible untoward effects (see Adverse Reactions). Patients taking psychopharmacologic drugs, central nervous system stimulants, or alcoholic beverages should be observed for possible evidence of intolerance. Those patients who experience central nervous system effects or blurring of vision should be cautioned against driving or working in situations where alertness is important.

No teratogenic effects have been seen in reproductive studies in rats and rabbits. Studies in pregnant women have, however, not been done and use of this drug in women of childbearing age should be undertaken only after weighing the possible risks to the fetus against benefit to the pregnant patient. It should not be administered to nursing mothers since it is not known whether the drug is secreted in the milk.

Precautions: Ineffective against bacterial infections. Patients should be observed for idiosyncratic reactions as with all new drugs. Geriatric patients with pre-existing serious medical illnesses with mental or physical deterioration should be followed carefully medically while taking "Symmetrel." (See Adverse Reactions.)

Adverse Reactions: With higher than indicated doses manifestations of central nervous system effects such as nervousness, insomnia, dizziness, lightheadedness, drunken feeling, slurred speech, ataxia, inability to concentrate and some psychic reactions including depression and feelings of detachment were seen. Occasional blurred vision was reported at higher doses. Some of the milder and less pronounced symptoms above have been reported in a small number of patients taking the recommended dosage of 200 mg per day. Those were mostly transient and disappeared with continued administration of the drug. Some geriatric patients developed paranoid or hallucinatory behavior and became unmanageable while taking 200 mg daily. Medically unselected seriously deteriorated geriatric patients showed poor clinical tolerance after several weeks of daily dosing with 200 mg per day. One elderly patient with a history of prior cerebrovascular accident developed visual hallucinations and grand-mal convulsions while on drug at 800 mg per day. Some cases of dry mouth, gastrointestinal upset and skin rash and rarely, tremors, anorexia, pollakiuria, and nocturia have been also reported.

Safety: When used as indicated, is generally well tolerated. No kidney, liver, bone marrow, or hematological disturbances have been observed.

Dosage: *Adults:* Two 100 mg capsules (or 4 teaspoonfuls of syrup) as a single daily dose or the daily dose may be divided into one capsule of 100 mg (or 2 teaspoonfuls of syrup) twice a day.

Children: 1 yr.—9 yrs. of age: Calculate total daily dose on the basis of 2 mg to 4 mg per pound of body weight per day (but not to exceed 150 mg per day). Daily dose, given as the syrup, should be given in 2 or 3 equal portions.

9 yrs.—12 yrs. of age: Total daily dose 200 mg given as one capsule of 100 mg (or 2 teaspoonfuls of syrup) twice a day.

How Supplied: *Capsules:* Bottles of 100. Each red, gelatin capsule contains 100 mg amantadine HCl.
Syrup: Bottles of 1 pint. Each 5 ml (1 teaspoonful) contains 50 mg amantadine HCl.

DUPONT

Symmetrel®

(Amantadine HCl)

A molecular barrier to virus penetration

arrest diarrhea

in • gastroenteritis • acute infections

LOMOTIL®

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride . . . . . 2.5 mg.
(Warning: May be habit forming)
atropine sulfate . . . . . 0.025 mg.

Effectiveness: Lomotil possesses a unique degree of effectiveness in both acute and chronic diarrhea.

Convenience: Lomotil is supplied as small, easily carried, easily swallowed tablets and as a pleasant, fruit-flavored liquid.

Versatility: The therapeutic efficiency, safety and convenience of Lomotil may be used to advantage alone or as adjunctive therapy in diarrhea associated with:

- **Ulcerative colitis**
- **Acute infections**
- **Irritable bowel**
- **Regional enteritis**
- **Drug therapy**
- **Food Poisoning**
- **Functional hypermotility**
- **Malabsorption syndrome**
- **Ileostomy**
- **Gastroenteritis and colitis**

Dosage: For correct therapeutic effect—Rx correct therapeutic dosage. The recommended initial daily dosages, given in divided doses, until diarrhea is controlled, are:

Children: Age	Total Daily Lomotil Dosage	Lomotil Liquid Dosage (Each teaspoonful [4 cc.] contains 2 mg. of diphenoxylate HCl)
3-6 months	3 mg.	½ tsp. 3 times daily
6-12 months	4 mg.	½ tsp. 4 times daily
1-2 years	5 mg.	½ tsp. 5 times daily
2-5 years	6 mg.	1 tsp. 3 times daily
5-8 years	8 mg.	1 tsp. 4 times daily
8-12 years	10 mg.	1 tsp. 5 times daily

Adults: 20 mg. (2 tsp. 5 times daily or 2 tablets 4 times daily) Based on 4 cc. per teaspoonful. Maintenance dosage may be as low as one-fourth the initial daily dose.

Precautions: Lomotil, brand of diphenoxylate hydrochloride with atropine sulfate, is a Federally exempt narcotic preparation of very low addictive potential. Recommended dosages should not be exceeded. Lomotil should be kept out of reach of children since accidental overdosage may cause severe respiratory depression. Lomotil should be used with caution in patients with impaired liver function and in patients taking addicting drugs or barbiturates. The subtherapeutic amount of atropine is added to discourage deliberate overdosage.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.

why wonder about a drug

when you know

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

s effective b.i.d.

It's made for b.i.d.

ective in a wide range of everyday infections — respira-
y, urinary tract and others — in the young and aged —
e acutely or chronically ill — when the offending organ-
ns are tetracycline-sensitive.

ntraindication — History of hypersensitivity to demethyl-
lortetracycline.

arning — In renal impairment, usual doses may lead to
cessive systemic accumulation and liver toxicity. Under
ch conditions, lower than usual doses are indicated
d, if therapy is prolonged, serum level determinations
ay be advisable. A photodynamic reaction to natural or
ificial sunlight has been observed. Small amounts of
ug and short exposure may produce an exaggerated
nburn reaction which may range from erythema to
vere skin manifestations. In a smaller proportion, pho-
allergic reactions have been reported. Patients should
oid direct exposure to sunlight and discontinue drug at
e first evidence of skin discomfort.

ecautions and Side Effects — Overgrowth of nonsuscep-
le organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

for noses of every description, one safe and sure prescription:

Otrivin®

(xylometazoline CIBA)
on Rx only

■ quickly relieves congested nose
■ action is gentle, yet prolonged
■ side effects are minimal

INDICATION: Nasal congestion. CONTRAINDICATION: Do not use in patients sensitive to small doses of sympathomimetic substances. WARNINGS: Prolonged or excessive use may cause rebound congestion. Use cautiously in patients with hyperthyroidism, coronary artery disease, hypertension, and diabetes. CAUTION: Do not shake Nasal Spray. Rinse Nasal Solution dropper or Nasal Spray tip in hot water after each use. No more than one person should use the same dropper bottle or nasal spray.
SIDE EFFECTS: Occasional local reactions: rebound congestion, slight burning or stinging, sneezing, dry nose. Occasional systemic effects: headache, drowsiness, lightheadedness, insomnia, palpitations. Overdosage in young children may produce profound sedation. DOSAGE: **Adults:** *Nasal Solution*—2 or 3 drops in each nostril every 4 to 6 hours. *Nasal Spray*—Squeeze rapidly once or twice in each nostril every 4 to 6 hours. **Children under 12:** *Pediatric Nasal Solution*—2 or 3 drops in each nostril every 4 to 6 hours. One drop should be used in infants under 6 months. *Pediatric Nasal Spray*—Squeeze rapidly once in each nostril holding tube upright; repeat every 4 hours as necessary. SUPPLIED: OTRIVIN® hydrochloride (xylometazoline hydrochloride CIBA) *Nasal Solution*, 0.1%; dropper bottles of 1 fluidounce bottles of 1 pint. *Nasal Spray*, 0.1%; plastic squeeze tubes of 15 ml *Pediatric Nasal Solution*, 0.05%; dropper bottles of 1 fluidounce. *Pediatric Nasal Spray*, 0.05%; plastic squeeze tubes of 15 ml. *Nasal Solutions* contain either 0.1% or 0.05% xylometazoline hydrochloride triethanolamine, hydrochloric acid, sodium chloride, and phenylmercuric acetate 1:50,000 as preservative in water. *Nasal Sprays* contain either 0.1% or 0.05% xylometazoline hydrochloride, potassium phosphate monobasic, potassium chloride, sodium phosphate dibasic sodium chloride, and benzalkonium chloride 1:5000 as preservative in water. *Consult complete literature before prescribing.*

POSTGASTRECTOMY SYNDROMES

WALTER F. BALLINGER, II, MD
Associate Professor of Surgery
The Johns Hopkins University School of Medicine

Postgastrectomy syndromes are identified and described. Vagotomy and pyloroplasty are advanced as preferable to subtotal gastrectomy with a gastrojejunostomy except in a case of malignant disease, since they comprise a conservative alternative which is much less likely to produce such results. Medical treatment and surgical correction of the more serious postgastrectomy syndromes are discussed.

The selection, by the Program Committee of the Medical and Chirurgical Faculty of the State of Maryland, of representatives of the Departments of Surgery of both of Baltimore's medical schools to deliver the first annual Amos R. Koontz Memorial Lecture would have pleased Dr. Koontz greatly. He not only gave much of his time to organized medicine through this Faculty, but also was intimately involved with the problems of teaching and of research. It is thus especially appropriate and gratifying to those of us engaged in academic surgery that my distinguished colleague, Dr. Robert Buxton, of the University of Maryland, and I, of Johns Hopkins University, were asked by your Program Committee to represent both schools of medicine in Maryland as Koontz Lecturers at the annual meeting of Maryland's Medical and Chirurgical Faculty.

Dr. Koontz spent many years in a noble field of surgery, that of reconstruction, repairing the hernial defects of nature and those created by surgeons.

It is a form of reconstruction about which I will speak here—repair of the altered physiology created by the surgeon in attempts to control the complications of peptic ulcer disease. Although gastrectomy has been practiced by surgeons for over 80 years, at times timidly and at times aggressively, it has only been in recent years that surgeons have developed a real awareness of, and concern for, their results. Internists and family practitioners can appreciate this statement since these physicians have followed postgastrectomy patients far more assiduously than surgeons have in past years.

Increasing awareness of the problem is a reflection of long overdue recognition of a splendid conservative alternative to removal of the stomach. This alternative procedure takes advantage of the fact that reduction (1) of the control of the brain over rates of gastric secretion of hydrogen ion by vagotomy, and (2) of gastric holdup of ingested alkaline food by pyloroplasty, permits an ulcer to heal, yet allows that complicated organ, the stomach, to remain otherwise undisturbed.

Subtotal gastrectomy, that is, removal of 50% to 75% of the distal stomach, with the performance of a surgical union between the proximal remaining gastric pouch and the jejunum,

Amos R. Koontz, MD, Memorial Fund Lecture presented April 28 at the 168th Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland.

remains the commonest surgical procedure for control of benign peptic ulceration today. Yet it is a field of controversy and in any such controversial area there are advantages and disadvantages in taking sides.

Nevertheless, I will side immediately with the gastric conservationists, opposed to removing an organ unnecessarily, dedicated to gastric preservation using vagotomy and pyloroplasty, and concerned about the number of patients unable to gain weight with various degrees of malabsorption after the standard subtotal gastrectomy and Billroth II gastrojejunostomy.

Variation in response to gastrectomy is a complicated subject in itself and it is only fair to state that this procedure has resulted in hundreds of thousands of relatively satisfied patients and only tens of thousands of dissatisfied ones.

Degrees of success are dependent upon the extent of resection, the preoperative weight of the patient, psychic factors, technical problems of anastomosis, etc. Nevertheless, it seems that there are fundamental factors in the development of the postgastrectomy syndromes. This is a plural term and it has only recently been pluralized. It has long been recognized that inadequate intake, bloating, cramping, diarrhea, and weight loss may follow gastrectomy, but specific symptom complexes have now become linked with anatomic and biochemical explanations. There is also a group of postgastrectomy syndromes caused by the operation and manifested in various ways. I shall attempt to persuade you that they can be relieved or cured sufficiently by an operation devised to restore as nearly normal anatomy and physiology as possible.

Several unphysiologic events, which are greatly significant to the economy of the patient, are permitted to take place by the performance of gastrectomy. One of the factors in the development of the postgastrectomy syndromes is a small stomach reservoir. Undigested hypertonic food is permitted to pass rapidly into the unprotected jejunum. It bypasses an afferent loop of duodenum where pancreatic and biliary secretions pour into the proximal portions to mix with gastric contents—but do not reach them until 12, 14 or 18 inches lower down in the gastro-intestinal tract. Finally, the absence of the normal antropyloroduodenal neuromuscular mechanism to hold up gastric emptying has a strong role in the development of the postgastrectomy syndromes.

There have been many classifications of the various syndromes—acute, chronic, etc. I prefer the division into mechanical, metabolic, and combined types, although most of the postgastrectomy syndromes are "combined" and therefore complex. The mechanical are the simplest and include internal hernia, intussusception of the jejunum into the stomach, etc. An example of a metabolic syndrome is the dumping syndrome, suffered by many patients after significant degrees of surgical resection of the stomach. The combined syndromes are exemplified by the afferent loop syndrome, which involves partial obstruction, stasis of duodenal contents and, in many cases, overgrowth of bacteria. The latter condition is frequently associated with an interesting, yet poorly understood malabsorption.

Most, if not all, patients who have severe manifestations of postgastrectomy syndromes develop psychiatric problems. Those of us who have had contact with patients who suffer severely and become "gastric cripples," realize the tremendous overlap of the psyche in this situation.

Finally, there is an intensification of various latent metabolic defects—of which lactase deficiency is an interesting example. In this condition patients who had mild or no milk intolerance before gastrectomy, develop severe intolerance to milk or milk products after removal of the stomach and ablation of the pylorus.

I will describe briefly some of the major postgastrectomy syndromes which are recognized as clear entities. My comments will be confined primarily to the early dumping syndrome rather than to the late hypoglycemic manifestations of dumping. The small stomach syndrome will be commented upon briefly, as well as afferent loop problems, problems of vagotomy and, finally, anemia, malabsorption and malnutrition.

Small Stomach Syndrome

The small stomach syndrome is obvious in its descriptive terminology. It varies with the extent of gastrectomy. Assuming that in most gastrectomies approximately 60% of the stomach is removed, with only 40% of the upper portion of the stomach left intact, one can realize that a major portion of the reservoir function of the stomach

and a large part of the mixing function of the stomach have been impaired.

The patient experiences an early sensation of fullness after ingestion of a small amount of food. This is accompanied by considerable epigastric discomfort which may proceed to severe pain. Nausea and vomiting are features of this effect, which occurs during the ingestion of food, not afterward. The patient responds quite dramatically by reducing his intake; weight loss and malnutrition follow. The malnutrition one sees after gastrectomy is probably due in large part to inadequate intake rather than to problems, complex as they are, of malabsorption.

The patient usually learns to treat his own small stomach syndrome but the best form of treatment is obviously prevention—avoidance of extensive gastric resection except when absolutely necessary. Frequent small feedings are resorted to by the patient and advised by the physician. Change in dietary intake, with a decrease in the amount of fat, will help in some cases. Finally, a segment of intestine—usually jejunum—can be interposed between the small gastric remnant and the duodenum, primarily to enlarge the stomach pouch and, secondarily, to restore more normal gastroenteric continuity from stomach to duodenum.

Malabsorption

Postgastrectomy malabsorption, a combined metabolic and mechanical defect, is caused by the reduced gastric reservoir followed by insufficient gastric digestion, poor mixing and rapid emptying; defective stimulation, because of the small gastric reservoir of the pancreas and gallbladder; and the absence of the normal antropyloroduodenal emptying mechanisms. Incoordination of gastric emptying causes incoordinate secretion of pancreatic and biliary substances into the duodenum. This is further complicated by the very rapid passage of contents to the intestine.

This complex subject is poorly understood. Nonspecific blunting and thickening of the jejunal mucosa occur far below the gastrojejunostomy. Although for many years it has been suggested that such mucosal changes occur, the more sophisticated techniques of biopsy now available indicate that they may be more common than was once supposed.

Dumping Syndrome

It should be noted that there are two major components in the disabling dumping syndrome: the intestinal and the vasomotor. The intestinal components are well-known: fullness, cramping, vomiting, explosive diarrhea, all occurring during the ingestion of foods or very shortly thereafter. These are then accompanied by weakness, dizziness, increased sweating, and tachycardia, of which the patient is aware. Increased peripheral blood flow has been observed in association with dumping.

In the 1920's, the rather obvious observation was made that food was literally "dumped" too early and too rapidly into the upper jejunum. Hyperglycemia was the first manifestation of the dumping syndrome that was actually measured. It then became clear that the elevation of blood sugar did not exactly parallel the development of symptoms. It was postulated that removal of one of the stomach's very important and little appreciated functions—that of an osmotic shield—could play a part in the dumping syndrome since the gastric mucosa does not permit rapid transfer of plasma from the blood into the stomach as it does in the jejunum. This loss of protective effect may account for the dumping. This, however, did not explain the entire syndrome; and approximately 10 or 15 years ago the very precipitous drop in plasma volume following the ingestion of a hypertonic carbohydrate substance into the jejunum was first described. This can be duplicated in normal individuals by passing the substance through a tube into the jejunum.

It was demonstrated by Hinshaw and associates in California, however, that the blood volume decrease did not exactly parallel the onset of symptoms. In an attempt to correlate redistribution of blood flow with symptoms, they put a plethysmograph on the tips of the fingers of various subjects. A rise in peripheral blood flow associated with dumping was discovered. This has been supported by many investigators, as is also true of renal plasma flow.

A marked redistribution of blood flow to the periphery in dumping became apparent—a totally unexpected finding. Other investigators have recently noted that the mucosa of the proximal gut contains large quantities of serotonin and, in asso-

ciation with dumping, have measured volumes of serotonin in the portal vein in experimental animals. Intravenous injections of serotonin into humans have reproduced the dumping syndrome. This of course explains the many attempts by clinical investigators to abolish the dumping syndrome through the use of serotonin antagonists, and it has been shown that rather large doses of serotonin antagonist will control many of the manifestations of dumping.

Thus the dumping syndrome, in its milder or moderate forms, can be treated medically with means—for instance, reduction of the osmolarity ease. Gastric emptying can be delayed by other of the gastric content by control of dietary intake. Some patients do not respond to these forms of therapy, however, and surgical reconstruction is preferable. It is well-known that patients who have a Billroth I or gastroduodenal anastomosis following gastrectomy have a lower incidence of dumping than those with an anastomosis between the jejunum and the cut end of the distal stomach or the proximal stomach.

Afferent Loop Syndrome

One of the more interesting postgastrectomy syndromes is the afferent loop syndrome. This is caused by the presence of a long loop between the closed end of the duodenum and the gastrojejunal anastomosis. This long loop (which in unusual examples may be as long as 36 inches) can herniate, thus causing a chronic obstruction. The type of obstruction which commonly develops with a long afferent loop results from the formation of scars at the site of the gastrojejunal anastomosis.

The afferent loop syndrome is characterized by severe crampy pain, by nausea during the ingestion of food or very shortly afterward, and by projectile vomiting, which often immediately relieves the pain. Weight loss results because the patients are simply afraid to eat. Many investigators have demonstrated blind loop complications due to stasis of duodenal contacts contaminated by pancreatic and biliary secretions and by secondary bacterial invasion. These cause a syndrome similar to that caused by multiple diverticula of the small bowel, or to the syndrome caused by the blind loops created by surgeons in side-to-side anastomoses. Bacterial contamination of the small bowel in some way, as yet poorly understood, causes malabsorption which may also be a dominant feature in the afferent loop syndrome.

Through the administration of cholecystokinin intravenously, Swedish investigators have recently reproduced the afferent loop syndrome in patients with some degree of obstruction at this level, simply by increasing the biliary and pancreatic secretions, and causing duodenal smooth muscle contraction.

It is clear that numerous untoward mechanical and metabolic alterations combine in varying ways and degrees to plague patients after gastrectomy performed for benign disease.

Review of the methods used to treat these syndromes indicates as many forms of therapy (patient- or physician-developed) as there are patients. For the individual with mild complaints, adequate intake of the right kind of food at frequent intervals, postural aids, pharmacologic agents and patience will be effective. Often an adjustment occurs spontaneously in months or years, and the discomfort abruptly lessens. We do not know why this happens—or who will be lucky and who will be unlucky.

Some continue to empty undigested food rapidly into the unprotected jejunum where it meets fatigued biliary and pancreatic secretions, perhaps bacteria-ridden after their long afferent loop journey. These patients dump, cramp, become nauseated, sweat, have diarrhea, continue to lose weight, and certainly think unkind thoughts about the surgeon who made them this way. Yet, a surgical trick can be employed in cases unresponsive to other therapy. Henley's procedure is one of the earliest used to restore gastrointestinal continuity after a Billroth II resection. The afferent jejunal loop is divided and transposed to the duodenum, restoring more normal alimentary continuity. Since this unprotected segment of jejunum is open to recurrent ulceration, vagotomy is a necessary component of the operation.

Surgical Procedures

I do not favor the operations in which an antiperistaltic loop is interposed between the stomach and duodenum to provide an obstructing or semiobstructing segment which delays gastric emptying.

Jejunal transposition can be very difficult to perform because the surgeon who undoes the

MEDICAL AND CHIRURGICAL FACULTY

1967 ANNUAL MEETING

APRIL 19, 20, 21

THE ALCAZAR, BALTIMORE

During the Annual Meeting, scientific papers on a variety of medical subjects will be presented by **Edgar S. Gordon, MD; Walter L. Henry, Jr., MD; Philip R. Lee, MD; Richard E. Palmer, MD; Milford O. Rouse, MD;** and **John W. Walsh, MD.** One session will be devoted to a kidney symposium, at which **Ervin A. Gombos, MD,** will speak on *Clinical Problems Associated with Chronic Dialysis,* and **Joseph H. Holmes, MD,** will speak on the *Medical Problems Associated with Renal Transplantation.*

ROUND TABLE LUNCHEON

On **Wednesday, April 19,** there will be a Round Table Luncheon held at the One West restaurant. There will be 25 tables, with a different subject discussed at each.

PRESIDENTIAL DINNER

The annual Reception and Presidential Dinner will be held at the Sheraton-Belvedere Hotel on **Thursday, April 20.** There will be professional entertainment followed by dancing.

HEALTH EVALUATION TESTS

Again this year the Health Evaluation Tests will be available to physicians, at the Alcazar, during all three days of the Meeting. Be sure to take advantage of this service being offered to the members of the Faculty.

damage often does not know how the original anastomosis was made. Adhesions are formed and loops may have become twisted, herniated or revolved in various ways. The mesenteric blood supply to the intestine is matted into the adhesive mass. This portion of the dissection can be particularly difficult. Nevertheless, with persistence, normal continuity can be restored.

Psychiatric Problems

Finally, I wish to refer to my earlier comment about the many psychiatric problems of patients with postgastrectomy syndromes. Four such patients were admitted to the hospital with very bizarre psychiatric complaints. They were afraid to eat, literally living in fear of the cramping and diarrhea which were manifestations of the severe dumping syndrome they had. Of these four patients, three have been sufficiently rehabilitated, following jejunal transposition, to return to their work, to their families and to a life of greater social ease.

* * * * *

The complex mechanisms leading to the state of gastric-invalidism following gastrectomy are reviewed. It should be noted that vagotomy and pyloroplasty occasionally result in dumping or other inadequate results, but that this occurs far less frequently than after subtotal gastrectomy with a gastrojejunostomy. Excessive criticism of subtotal gastrectomy is not intended, since most patients with such resections become well. My point is that many do *not* become well, and that *more* patients with vagotomy and pyloroplasty do. If other methods fail, jejunal transposition, increasing the size of the gastric pouch and restoring more normal alimentary tract continuity, will return most of these malnourished, postgastrectomy invalids to society.

FIGHTING CANCER WITH FILMS...

...is not news. What's news is that we've embarked on the most ambitious film program *for professional medical audiences* ever launched against a single disease. A half-million dollar film project is underway—with technical advice from the nation's leading medical authorities.

Five of these films are available now—
CANCER IN CHILDREN, DIAGNOSIS AND MANAGEMENT OF CANCER OF THE COLON AND RECTUM, ORAL CANCER, NURSING MANAGEMENT OF THE PATIENT WITH CANCER, and THE DENTIST AND CANCER. The balance will be released in 1967-1968.

As pioneers in the usage of medical films, we know their value as teaching tools. Our Units across the country know, too. Films are a vital part of their professional educational programs. We hope you will contact *your* local ACS Unit about this outstanding new series.

AMERICAN CANCER SOCIETY®

GASTRIC CARCINOMA

ROBERT W. BUXTON, MD
Professor of Surgery
University of Maryland School of Medicine

In recent years there has been a marked increase in the period of survival of patients who have undergone operation for gastric carcinoma. A study spanning 15 years and encompassing 257 patients shows that regional node negativeness is the only factor clearly related to long survival. The prognosis for patients with ulcerating carcinoma is mistakenly thought to be better than average. No greater survival in the cure of stomach cancer has been possible with an increase in the physician's concern for the patient with a peptic ulcer. The suspicion of gastric cancer is higher, particularly if there is a history of familial occurrence of carcinoma.

I am pleased and honored to be one of the Amos R. Koontz lecturers today.

One of the earlier speakers expressed the opinion that surgery, general surgery, had reached its apogee and was, perhaps, on the decline. I do not think Doctor Koontz would have accepted that statement without a vigorous protest; not only do I miss hearing his forthright and pithy comments, but I would like to add my own vigorous protest to the above-mentioned opinion.

I chose the subject of stomach carcinoma because I thought it appropriate to the man for whom this lectureship is named. My knowledge and recollection of Doctor Koontz is of a clinical surgeon. His approach to these patients might perhaps be characterized by a quotation from an English edition of *Theodoric Surgery* written in the 13th century:

> "Therefore, before you proceed to the treatment of the patient, consider his symptoms and if what you see is obviously bad and likely to worsen leave him alone. And, if you see good symptoms then you should not fear, and go ahead."

The prognosis of gastric cancer is generally regarded as poor; this observation is true of any neoplasm, of any organ, which has reached a state of extensive local invasion or from which spread to adjacent or distant structures has taken place. It seems obvious that the prognosis is more favorable if the lesion is localized and readily resectable. This is the basis for the observation that recovery from gastric resection may result in (a) a permanent cure, with no residual cancer, overt or occult; (b) five-year survival, but with coincident or subsequent reappearance of the tumor; or (c) fatal termination within five years from local or distant tumor which was not apparent at the time of initial operation.

Such observations have raised the speculation as to whether there are high-risk and low-risk groups of patients with gastric carcinoma and, if such groups exist, whether factors can be determined which may account for the slower growth

Amos R. Koontz, MD, Memorial Fund Lecture presented April 28 at the 168th Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland.

rates in some patients.

It has been reported repeatedly that in the last 30-35 years there has been a progressive decrease in the incidence of gastric cancer in the United States. This has encouraged many physicians to believe that within the next several decades the incidence of this entity will diminish to the vanishing point—a most pleasantly optimistic prospect. Of greater immediate significance has been the striking increase in years of survival of patients who have undergone operation for their cancer. Some appreciation of this modest improvement is apparent in the patients studied in this paper.

In order to determine some of the factors which seem to affect the outcome of patients with cancer of the stomach treated by operation, all of the patients seen at the University of Maryland Hospital from 1950 through 1965, a fifteen-year period, have been reviewed (Fig 1). This amounts to 257 patients.

The number of patients admitted to this hospital have generally and slowly increased each year; the patients with cancer of the stomach have varied widely and do not give an absolute picture of progressively decreasing frequency.

In spite of the possibility of longevity with this disease, the attitude of many physicians has been one of pessimism and discouragement. This is clearly the attitude which concerned Wangensteen when he wrote, "Of patients who come to resection for gastric cancer, the majority (75%) exhibit metastases to lymph nodes." He went on to report, however, that of "patients with gastric cancer exhibiting no lymph node involvement, there are 50% five-year survivors." These contrasting statements are of utmost importance in our approach to the patient with possible gastric carcinoma, for in the two statements lies the only clearly expressed advantage of early definitive operation.

Equally as discouraging as lymph node positiveness are two other groups of patients in this present study. Of the 257 individuals (Table 1) 18% (46 patients) were not suitable for operation, and one-third (85 patients) were considered unresectable at the time of operation. Thus, 50% of the patients, when first seen by us, could not be helped in their disease.

Although the physicians' part in the delay is

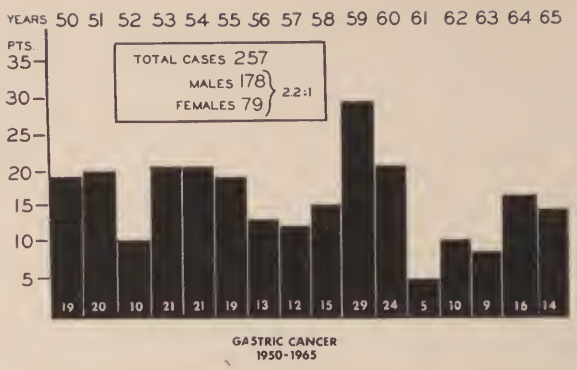

Fig 1

never completely clear, it was possible to document some instances of this. Forty of the patients in the series were known to have a peptic ulcer. Since commonly these are gastric ulcers, it is of interest to point out that four (10%) in this sub-group were duodenal ulcers. Four patients were followed, without operation, to their deaths with their ulcer/carcinoma.

It is sometimes said that the prognosis, in general, for long-term survival in the patient with ulcerating carcinoma is better than under some other circumstances. Among our patients this does not appear to be so inasmuch as ten patients, or one-third of those who were operated upon (Table 2), lived three years or more while only five

patients (16%) lived five years or longer. Four patients in this series, however, have died of diseases other than recurrent carcinoma; in two of these, necropsies failed to show recurrent carcinoma at one year and 4½ years, and it is presumed that all four individuals were cured of their cancer by operation.

Forty-eight patients with cancer at all sites within the stomach were operated upon with the hope that some definitive procedure could be carried out (Table 1). In each the surgeon was able to accomplish a palliative resection only, leaving known tumor within the abdomen. Some of these patients were known to have had their gastric lesion for a long period. They compose 18.7% of the entire group. The average survival in this group of patients is six to nine months, but seven patients lived more than one year, and two of these are known to have lived more than five years. By contrast the average survival of patients who had operation without resection was 4.6 months, five patients lived more than a year and one of these lived longer than five years.

It would appear that several of the above patients had tumors which showed a remarkably slow rate of growth and that if they had been seen when somewhat less advanced, or if a more aggressive resection had been attempted, indefinite survival might have been achieved for a few. Lest one be too critical of the surgeons who operated upon these patients, it is well to record that adeno-carcinoma was present in one of the biopsied liver nodules from the longest surviving patient.

It seems proper to suggest that one of the most important, and to some extent the most controllable, factor in the future of the patient with gastric cancer is the spread to regional and distant lymph nodes. It is perhaps incorrect to suggest that early diagnosis and treatment are directly related to node positiveness or negativeness and yet, in truth, and in a large number of patients, this is so.

Table 3

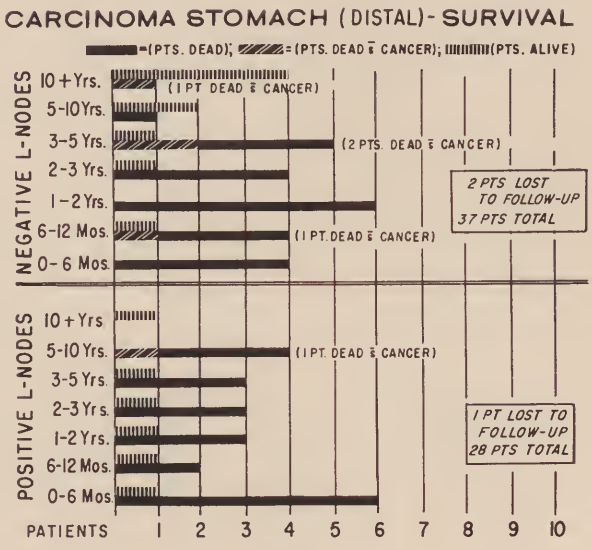

Fig 2

Of the patients in this study with carcinoma in the distal stomach, 30% (65 patients) were considered suitable for resection for cure (Table 3); 28 (43%) of these had no evidence of cancer in lymph nodes removed by operation. The patients with negative nodes lived an average of 10 months longer and, as might be anticipated, the five- and ten-year survivals were much more numerous (Fig 2).

It seems useless to compare these patients with those whose lesion is at the esophagogastric junction except for the fact that in both instances the operative mortality rate is appreciable (Table 4), though three times greater in the higher location. Finally, it is well to observe that long-term survival is possible and attainable when the lesion arises high within the stomach.

Of much interest has been the attempt to determine the effect of heredity on these patients as indicated by a family history of carcinoma. In 79 patients we are without a clear history of the familial presence of cancer. Of the remaining patients, one out of five, or 20%, had a familial occurrence of carcinoma—in one or more relatives. In 15 patients there was known familial

gastrointestinal carcinoma (Fig 3) and in 5 there was carcinoma in the stomach of parent or sibling. In these patients the resectability was the same as in the over-all group (33%), 7 patients survived more than one year, 4 more than three years and 2 patients have lived more than ten years.

Thus, this group of individuals follows much the same pattern as the larger sampling. However, the familial history of cancer in one of five patients suggests a substantial number of patients in whom the physician should be intensely concerned when a series of symptoms or clinical findings suggest a gastric neoplasm.

One of the outcomes of this study has been the recognition of an unusual carcinoma in a single patient. In 1948 there appeared a report by Steiner et al, of an undifferentiated special type of carcinoma described by them in six patients. Five of their six patients were men. In each instance the tumor was associated with a good prognosis. Histologically the tumor was composed of masses and solid cords of cells with irregular pale nuclei and little cytoplasm. The stroma was rich in chronic inflammatory cells and the cancer cells were densely basophilic. The tumors were called "blue cell cancer." Their histogenesis could not be defined by special staining techniques. One of the six patients had lymph node metastasis.

In our own series there is one patient, a Negro male, now alive more than 15 years with this type of tumor. At the time of gastrectomy there were lymph node metastases present. This patient was readmitted and his abdomen reexplored in 1964 because of acute intestinal obstruction. At that time a careful search for metastatic or residual gastric carcinoma was made and none was found. This patient is an example of a unique tumor which is indeed associated with a good prognosis.

Conclusions

The items which appear to contribute to long survival and cure from gastric carcinoma have

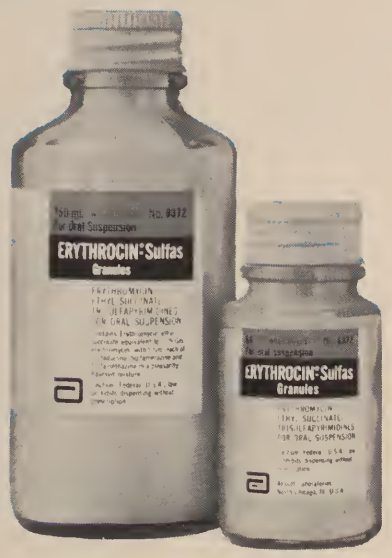
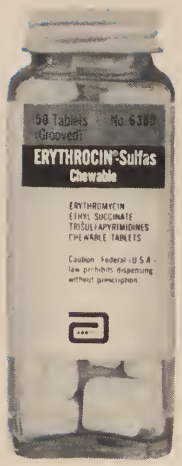
been explored. In 257 patients except for one with a peculiar carcinoma cell type, "the blue cell carcinoma," the only fact relating clearly to long survival is regional node negativeness.

In this study 70% of our patients were unsuitable for operation, had unresectable lesions at operation or had palliative operations only. Thus, only 30% had potentially curable lesions when first seen by the surgeon.



From our review it appears that a family history of cancer, particularly of the gastrointestinal tract, may lead to early suspicion and earlier diagnosis in some patients with gastric cancer.



The presence of peptic ulcer, particularly gastric ulcer, has served to alert us to the possibility of gastric cancer. In this series such an ulcer has not improved prognosis in such a patient. This should serve to remind the physician that early surgical treatment is the only effective cure for ulcerating gastric carcinoma.

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

ABBOTT

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

COMPONENT MEDICAL SOCIETIES

WASHINGTON COUNTY

The Washington County Medical Society held its annual meeting on November 3, 1966, at the Venice Motel. The following were elected to office for 1966-1967:

President: **Richard T. Binford, MD**
President-elect: **John H. Kehne, MD**
Vice-president: **Edward W. Ditto, III, MD**
Secretary: **John W. Clark, MD**
Treasurer: **Sidney Novenstein, MD**
Board of Censors: **John J. Dobbie, MD**
Delegates: **Harold H. Gist, MD**
Ralph H. Williams, MD
Alternates: **James R. Dwyer, MD**
Robert M. Russell, MD

* * * * *

J. Walter Layman, MD, was honored for fifty-years-plus membership in the Washington County Medical Society. He joined the group in November, 1913. He will receive a pin from the society as a token of its esteem.

* * * * *

Thomas V. Craig, MD, and **John J. Donoghue, MD,** attended the meeting of the American College of Surgeons in California in October.

Joseph C. Crisp, MD, attended the Mid-Atlantic regional meeting of the American Urological Association held at the Greenbriar in White Sulphur Springs, West Virginia, in October.

Gerald LeVan, MD, attended the Southern Medical Association meeting in Washington, DC, in November.

Richard A. Young, MD, attended the meeting of the American Academy of Pediatrics held in Chicago in October.

* * * * *

Philip J. Hirshman, MD, has officially retired after forty years in the general practice of medicine. He has now been elected to emeritus membership in the Washington County Medical Society. Our best wishes to him for a happy retirement.

As part of the Washington County Medical Society's effort to expand health education, it selected a large three-dimensional ear model with description of ear anatomy and common ear conditions for the Health Fair. How sound travels and the effect of motion were described. The exhibit was set up in conjunction with the Hearing Testing Trailer. The fair was held at the North Hagerstown High School November 12 and 13, 1966.

John W. Clark, MD

WICOMICO COUNTY

Richard D. Bauer, MD, president-elect of the Medical and Chirurgical Faculty of the State of Maryland, and **John Sargeant,** executive secretary of the Faculty, were guest speakers at the November meeting of the Wicomico County Medical Society, Inc. Current and projected plans of the Faculty were the subjects.

Arrangements have been completed for **William Weglicki, MD,** of Baltimore, to be the featured speaker for Day with Doctors, a medical career program for high school students, which is jointly sponsored by the Wicomico County Medical Society and the Heart Association of the Lower Eastern Shore. Students from Wicomico and other lower shore counties will participate in the two-day meeting, which is scheduled for December 9 and 10.

MYOCARDIAL INFARCTION, SMOKING, AND ACTIVITY

Among men, it's the smoker who is relatively inactive who is most likely to suffer a myocardial infarction and, later, a fatal attack. The amount of exercise men get seems to be the major factor in determining whether they survive the first heart attack. The more active they are, the better their chances. The least active nonsmoker is nearly twice as likely to experience a rapidly fatal myocardial infarction as the more active smoker. Inactive men who smoke cigarettes show a mortality rate nearly nine times that of more active nonsmokers of similar age.

These findings are reported by the Health Insurance Plan of Greater New York in the December 19, 1966, issue of *Journal of the American Medical Association.*

During an 18-month study of 110,000 men and women, 301 men suffered a first myocardial infarction, the report said.

"Fifty per cent of the least active men who smoked cigarettes were dead within four weeks of (the attack), compared with 28% of the smokers with higher levels of physical activity," the report said.

For nonsmokers, the corresponding figures were 56% for the least active men and 17% for those who were relatively more active.

From an AMA news release, Dec 19, 1966.

Phenaphen® with Codeine

the only leading compound analgesic that calms instead of caffeinates

Each capsule contains:

Phenobarbital (¼ gr.) ..... 16.2 mg.
(Warning: may be habit forming)
Aspirin (2½ gr.) .....162.0 mg.
Phenacetin (3 gr.) .....194.0 mg.
Hyoscyamine sulfate .....0.031 mg.
Codeine phosphate.....¼ gr. (No. 2), ½ gr. (No. 3), 1 gr. (No. 4)
(Warning: may be habit forming)

Contraindications: Hypersensitivity to any ingredient.

Precautions: As with all phenacetin-containing products, avoid excessive or prolonged use.

Side Effects: Side effects are uncommon—nausea, constipation, and drowsiness have been reported.

V-Cillin K® Lilly 700157

Potassium Phenoxymethyl Penicillin

(See next page for prescribing information.)

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K is the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly). This chemically improved form combines acid stability with immediate solubility and rapid absorption. Higher serum levels are obtained more rapidly with this penicillin than with equal oral doses of penicillin G. The higher serum levels and acid stability of V-Cillin K make it a more dependable penicillin for oral use.

V-Cillin K, Pediatric, is an oral solution of clinically proved V-Cillin K in teaspoon dosage form. When mixed as directed, each 5 cc. (approximately one teaspoonful) will contain 125 mg. (200,000 units) phenoxymethyl penicillin as the potassium salt.

Indications: V-Cillin K has been shown to be effective in the treatment of streptococcus, pneumococcus, and gonococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy and tooth extraction in those patients with a history of rheumatic fever or congenital heart disease.

Contraindication: V-Cillin K should not be administered to a patient with a history of penicillin hypersensitivity.

Precautions: V-Cillin K should be used cautiously, if at all, in a patient with a strongly positive history of allergy. Reactions occur more frequently in individuals with bronchial asthma or other allergies or in those who have previously demonstrated sensitivity to penicillin. If hypersensitivity reactions occur, the drug should be discontinued.

Adverse Reactions: Although serious allergic reactions are much less common with administration of oral penicillin than with intramuscular forms, skin rash, symptoms resembling those of serum sickness, or other manifestations of penicillin allergy may occur. When penicillin is administered, measures for treating anaphylaxis should be readily available. Those include epinephrine, oxygen, and pressor drugs for relief of immediate allergic manifestations as well as antihistamines and corticosteroids for delayed effects.

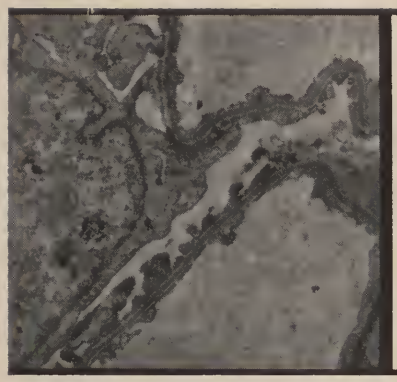
The use of antimicrobial agents may be associated with the overgrowth of antibiotic-resistant organisms; in such a case, antibiotic administration should be stopped and appropriate measures taken.

Administration and Dosage: For Tablets V-Cillin K and for V-Cillin K, Pediatric, the usual dosage ranges from 125 mg. (200,000 units) three times a day to 500 mg. (800,000 units) every four hours. For infants, the daily dosage may be 50 mg. per Kg. of body weight divided into three doses.

Beta-hemolytic streptococcus infections without associated bacteremia may be treated with 200,000 to 400,000 units three times a day. Therapy should be continued for a minimum of ten days to prevent development of rheumatic fever and/or other serious complications. Dosage for routine streptococcus prophylaxis in patients with a history of rheumatic fever or congenital heart disease may be 200,000 units once or twice daily. When such patients undergo tonsillectomy, tooth extraction, or other minor surgery, the prophylactic dose should be 500,000 units every six hours given two days prior to surgery and for two days postoperatively. If oral medication is not feasible on the day of surgery, parenteral therapy should be considered. Mild to moderately severe pneumococcus pneumonia has been treated effectively with 250 mg. every six hours.

In staphylococcus infections, 400,000 units or more should be given every six to eight hours in conjunction with indicated surgical procedures.

For gonorrhea in males, 500 mg. (800,000 units) every six hours for three doses may be employed; in females, 500 mg. every four hours for six doses are recommended. Patients with a suspected lesion of syphilis should have a dark-field examination before receiving penicillin and monthly serologic tests for a minimum of three months.



How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 units), in bottles of 50 and 100; 250 mg. (400,000 units), and 500 mg. (800,000 units) in bottles of 24 and 100.

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,000 units) per 5 cc. of solution, in 40, 80, and 150-cc.-size packages.

Will Pathology Be At the Center of a Core Curriculum?

MITCHELL J. ROSENHOLTZ, MD

Subsequent to World War II, stimulated by the now well-known curricular experiments at Western Reserve School of Medicine, the undergraduate medical school curriculum has come under increasing scrutiny. The accelerated pace of such review appears at present to be directly related to a variety of forces, clearly outlined in the Coggeshall Report.[1] These forces include demographic and economic factors, the growth of specialty practice, the increasing institutionalization of practice, the remarkable proliferation of medical knowledge, obvious improvements in both secondary and college curricula, and changes in the patterns of disease in our population. Another very important contributing force is the pressure of the legislative and executive branches of the Federal Government to support new mechanisms to speed the application of biomedical research to the bedside of as many patients as possible. This force has become especially apparent since the Report of the President's Commission on Heart Disease, Stroke, and Cancer.

From the standpoint of the pathologist, several of the curricular revisions presently in operation or recently proposed are of particular interest. Cope and Zacharias,[2] for example, have edited a most exciting, if not speculative, monograph describing the Endicott House Summer Study on Medical Education which took place in 1965. At that "retreat" in which 35 educational administrators and educators, mainly from medical schools, participated for two weeks, four subcommittees each proposed hypothetical curricula in the light of the general discussions at the Summer Study. Certain themes which run through several, if not all, of the four curricula, seem significant. They include (1) medical school and college curricula of only three years each; (2) more clear-cut coordination of medical school and house staff educational experiences, often all under the control of medical school faculties; (3) a disciplinary or organ approach to course organization, rather than a departmental one; (4) a striking increase, compared to the present, in elective offerings allowing for very diversified experiences for each student; and (5) the presentation, usually in the first year, of a course emphasizing the "biology of disease."

A course in the Biology of Disease might well be expected to receive its leadership and main impetus from a department of pathology, and to draw its support from a wide range of other departments, including, for example, internal medicine, biostatistics, microbiology, physiology, biochemistry, etc. Pathology's leadership would very probably revolve around a "case method" approach, emphasizing the many implications of a given disease process. Clearly, then, the other basic sciences, besides pathology, would be expected to present a course experience for their graduate students very different from the one for the medical students. Such a first-year course itself would act as preparation for the student's activities in the second year, which would emphasize clinical clerkships not dissimilar to those

now a part of many schools' third year curricula.

In contrast to the Endicott House Curricula, the curriculum which began at Duke in the present academic year would not put pathology in such a central role. Rather, all six basic sciences are presented in the first year, with each stressing only that "core" of material which seems "essential" for all medical students to understand. Such "core" courses have been presented in the last two years in several disciplines, including pathology, as part of Duke's otherwise classical curriculum. They have apparently been successful. Only time will tell if the Duke freshmen, a very able student body, can tolerate all six core courses in one year.

Finally, mention should be made of the curricular revision in progress, and under study, at the University of Maryland School of Medicine. Only the first year program is in actual operation. In it, anatomy, physiology, and biochemistry run side by side with every attempt being made to coordinate the presentation of material, mainly on an organ system basis. Selected topics in biophysics and pharmacology are also presented.

The Curriculum Committee proposals for the years subsequent to the first are now under active discussion. Their similarity to certain of the Endicott House suggestions seems clear. For example, at Maryland it is suggested that the second year be more fully coordinated and, for the most part, revolve around the pathology course which, for almost ten years, has laid heavy emphasis on a "case" approach. A further suggestion of the Curriculum Committee is a course in Pathologic Physiology and Clinical Coordination which would precede the more classical clinical clerkships. Almost certainly, the pathology department would be an active participant in such a coordinated "preclerkship."

In conclusion, it seems very likely that, both at the University of Maryland and at many other medical schools, departments of pathology will be playing very critical roles in curricular revision in the next decade. This trend may be expected to be especially prominent in those schools which attempt to present courses in Biology of Disease early in the medical school experience.

Practical Aspects of Antimicrobial Therapy

MOHSEN ZIAI, MD
Associate Professor of Pediatrics
The Johns Hopkins University School of Medicine

The antimicrobial agents are two-edged swords. While remaining as important weapons in the fight against many infections, they carry with them potential hazards and limitations. With their improper use, it is possible to induce morbidity and cause mortality. In order to use antimicrobial agents properly, it is important to know the manner in which they work and the objectives of their administration.

In a previous article* the mode of action of these drugs has been discussed. In the present communication an attempt will be made to derive certain practical conclusions and explain how, with the use of these agents, the offending organisms can be destroyed with the least possible harm to the patient.

A. *Irrational treatment*—Because of many erroneous assumptions, antibiotics are the most inappropriately used of all presently available drugs. Certain clarifications are therefore needed:

(1) Antibiotics are not antiseptics and must not be used as such.

(2) Improper use of antimicrobials contributes to serious, sometimes fatal, sensitivity reactions and/or emergence of resistant strains.

(3) Drug combinations, except under specific therapeutic circumstances (enterococcal endocarditis, tuberculosis, brucellosis), are often useless and may even be hazardous.

(4) Prophylactic antibiotics are indiscriminately used and can be potentially dangerous except in certain selected situations.

(5) Pharmacological data on antimicrobial agents which are gathered in adults are not necessarily applicable to infants and children. Unless the safety of each specific agent (including a critical evaluation of the dosage) is established, it may be dangerous to use these drugs.

(6) Antibiotics are not substitutes for surgical drainage.

(7) Antibiotics should not be used in the treatment of undiagnosed fever unless the evidence points to the infectious nature of the illness and the patient's life is in danger.

(8) It is important to provide the necessary supportive therapy and not assume that the antibiotics will do all the work.

(9) New and more expensive drugs are not necessarily superior to the old established agents.

(10) In choosing between two equally effective drugs, it is important to consider the cost,

**Mode of Action of Antimicrobials* by the same author, PEDIATRICS, THE JOURNAL, Vol. 15, No. 12.

the availability and toxicity of each.

B. *Rational Use of Antimicrobials* — Ideally, the physician should know the nature of the offending organism and the anatomical sites of infection in order to choose the proper drug. This is unfortunately not always possible. Bacterial cultures and sensitivities may not be available, and when they are obtained, treatment may have to be started before the results are known. Certain general considerations that follow may therefore assist in the formulation of the therapeutic regimen.

Unless the patient's life is in danger, it is best to delay antimicrobial therapy until the etiological diagnosis can be made with some confidence, so that the selection of the therapeutic agent can be accomplished logically. It is generally important to be familiar with the specific organisms, the clinical pictures which they usually produce, and the antimicrobial sensitivity of these organisms in the particular geographical location. For example, the organism most likely to cause the first bout of urinary tract infection in a child is E coli; in almost all cases, such an infection is susceptible to sulfonamides and tetracyclines. In contrast, the small infant whose mother has recently been hospitalized with staphyloccocal abscesses, and who becomes ill with a severe pulmonary infection, is probably suffering from a resistant staphylococcal pneumonia and is best treated with one of the penicillinase-resistant penicillins.

An important step in the laboratory determination of the specific etiology should consist of obtaining a gram stain — a simple procedure which is often by-passed.

Another common infection which can be used as an illustration is tonsillitis. Since a frequent bacterial etiology would be group A beta hemolytic streptococcus, the physician decides to treat the patient with antimicrobials. It becomes mandatory not to use any drug but penicillin or, in case there is a history of allergy to this agent, erythromycin; in either case the drug must be used in full dosage and for a sufficiently long period (10 days). In a young patient the main purpose of such treatment would be the prevention of rheumatic fever and nephritis. Other drugs do not fulfill this purpose.

In known infections it is wise to use one specific drug. In this way toxic effects, including sensitivity reactions as well as emergence of resistant strains, are reduced and the cost to the patient is minimized. Combinations of antibiotics are helpful only in rare instances of known synergism, and when there is a mixed infection. The commercially available mixtures must not be used, however, because they usually contain an inferior product, and the amount of each drug is usually not sufficient for the specific infection against which it is directed.

Knowledge of the specific drug pharmacology is important. When two agents seem to be especially effective against a specific infection, the one that achieves better concentrations at the site of infection, eg, subarachnoid space, would be preferable. The patient's own defense mechanisms, his age, and the physiological state of his various systems involved in drug pharmacology, are added considerations. For example, in the presence of renal failure the choice of a nephrotoxic drug, or one that depends on renal excretion, would be unwise.

In the neonatal period and in prematures, the administration of drugs and the calculation of dosages is especially critical if such complications as gray spinal syndrome, due to chloramphenicol, and kernicterus, due to sulfonamide therapy, are to be avoided.

Prophylactic use of antimicrobials has proved to be effective only in the following specific situations:

(1) Penicillin in gonococcal and syphilitic infections, meningococcal infections, rheumatic fever in susceptible individuals, pneumococcal infections in agammaglobulinemia, and endocarditis in susceptible subjects.

(2) Antimalarial prophylaxis in endemic regions.

(3) Antituberculous drugs in patients with known previous tuberculous infections who are undergoing stressful situations, eg, an operation or an attack of measles.

REHABILITATION Notes

REHABILITATION SECTION
BALTIMORE CITY MEDICAL SOCIETY,

DOUGLAS G. CARROLL M.D.
EDITOR

Evolution of Hand Function

DOUGLAS G. CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

A major concern of a department of physical medicine and rehabilitation is the restoration of upper extremity function following trauma, reconstructive surgery, arthritis, burns, amputations and a number of neurological diseases.

Over the next few months in REHABILITATION NOTES, we will be concerned with what hand function is, how it is deranged in various diseases, and what the aims of therapy are. These notes will attempt to draw attention to the nature and significance of the loss of function rather than to a specific program of treatment. An understanding of the nature of impairment in hand function in various diseases should promote more effective treatment programs.

* * * * *

Function, in the physiological sense, pertains to the normal or special action of any organ or part of a living animal. A number of attempts have been made to identify and describe the characteristic normal hand function in Primates.[1-6] Basic to any theory of the evolution of hand function is a description of hand function in serially higher members of the primate series.

Methods

In each of the species selected, an attempt will be made to compare its hand function with hand function in a normal human hand. The assumption will be made that the hand test described by the author[6] includes the major significant functional activities of the human hand. There are several difficulties in attempting to apply this test to lower forms. In the first place, not enough observations have been made on hand activities in lower primates to know whether or not they can perform certain of the activities in the hand test. Secondly, the test was designed for the human and therefore is not entirely appropriate to animals of different size and strength.

Hand Function in Primates

In the earliest forms of land animals, there is already a differentiation between the fore and hind limbs. The fore limbs, used for digging, propulsion, grasping, and clinging, are more mobile than the hind limbs, which are used for pushing. The pelvis tends to be more stable than the shoulder girdle.

A purely terrestrial life led to increasing stability of all the limbs with loss of the clavicle, loss of radial and ulnar rotation and loss of digits (as seen in the hoofed animals).

Arboreal life, on the other hand, led to more mobility of the shoulder, more rotation of the forearm and finer prehensile function.

The author would like to thank William L. Straus, Jr., PhD, professor of anatomy and physical anthropology at the Johns Hopkins University School of Medicine for his guidance in the preparation of this article.

ARTHRITIS ADVANCES IN 1966 CITED

In 1966, news of progress in arthritis research moved off dead center and offered genuine hope, for the first time in years, that science is on the right track. Fresh clues gave strong support to the idea that arthritis—in some of its most painful and crippling forms, at least—is due to infection—something which might be prevented or counteracted without too much difficulty. This assessment of progress was made by William S. Clark, MD, president of The Arthritis Foundation, in a year-end report. He pointed also to important recent advances in drug therapy for arthritis sufferers.

"I know of no year since 1948—when recognition of the rheumatoid blood factor triggered a new line of research—in which so much has happened pointing to a specific answer to the arthritis mystery," Dr. Clark said: "I don't want to raise false hopes but I honestly feel there is solid ground for new optimism."

Arthritis in its various forms affects 13 million Americans, more than five million of them suffering from rheumatoid arthritis, according to Dr. Clark.

From an Arthritis Foundation news release, Dec, 1966.

The following is a description of what is known about hand function in various primates in an ascending order.[7]

1. **Tree shrews:** These small agile, large-eyed, arboreal, squirrel-like animals were previously included in some classifications with the Insectivora. Modern classifications have included them as the family Tupaiidae in the Infraorder Lemuriformes (Suborder Prosimii). *Tupaia glis* moves easily over small branches. The clawed hand holds onto large branches by digging in the claws. Small branches are held by clasping twigs toward the palm with the digits. The Tupaiidae are the only primates which have convergent hands.[1] In a convergent hand the fingers are arranged in a fan. They separate from each other on extension; when they flex they converge. The fingers act as a whole without individual movement and take the shape of the object around which the fingers converge. This species has the maximal variability of grasp of all primates. *Tupaia glis* can pick up food in one hand, but rarely does so.

2. **Lemurs:** The lemurs are, in a sense, intermediate forms between the tree shrews and the monkeys. The lemur resembles the shrew in its rhinarium and medial lip cleft. It resembles the monkey in the use of the hand and foot for grasp. Unlike the tree shrews, lemurs generally have flat nails on at least some digits. Some forms show a greater degree of specialization than higher primates. The pollex, rudimentary in some, varies in length and in degree of separation from the second digit (d2). D2 and d3 show lesser variations.[8] The thumb may be widely separated from the index finger, opposite the other digits, and may reach the ulnar digits when grasping a branch; however, the thumb metacarpal moves on a hinge-joint in only one plane.[1] Wood Jones[9] described the truly opposable thumb as the human thumb, that is, one of which the metacarpal can be rotated through a wide arc on the carpus. The thumb of these lemurs is therefore not truly opposable. In many Lemuriformes and Lorisiformes observed by Bishop,[1] a large part of the ball of the thumb can be brought into contact with the ball of d2 and d3. Prosimians, however, do not pick up objects by pinch between the balls of two digits.

In the lemur hand the phalanges of the thumb flex at the same time as do those of the other digits. There is no individual control of the digits. This is called whole-hand control.

Recent lemurs show relative elongation of the fourth digit of both the hand and foot. This lengthening is associated with a thumb opposed to the other digits and possibly allows an increased span of the grasping hand around a branch. Associated with these changes is a rearrangement of the interosseous muscles around d4 as the axis.

Lorisiform lemurs tend to grasp small objects between the ends of the digits and the distal palmar pad whereas Lemuriform lemurs tend to pick up small objects between the finger pads and the proximal part of the palm. All of these actions, however, occur by whole-hand control. There is a single prehensive pattern with a multiplicity of grips.[1]

3. **Tarsius:** This is the only living genus of the superfamily Tarsioidea (infraorder Tarsiiformes) although there are a number of fossil forms. There is still no agreement on *Tarsius'* taxonomic status, but it appears to be somewhere between the lemurs and the monkeys. Hand activities are of the whole-hand control type.

4. **Ceboidea:** The New World or platyrrhine monkeys are nearly all arboreal. They have whole-hand control. Generally the thumb flexes in the same plane with the other fingers and is not pseudo-opposable.[1]

Some forms (*Cebus* and *Cacajao*) can use the sides of d1, d2 and d3 to manipulate small objects. They can also grip with flexion of d1 around the object. Other species (*Ateles* and *Lagothrix*) can pick up small articles by closing two fingers in a scissors grip.

5. **Cercopithecoidea:** The Old World or catarrhine monkeys are divided into two large groups: the subfamily Cercopithecinae (macaques, baboons, mandrills) and the subfamily Colobinae (langurs). Two new developments in hand function are seen in the Cercopithecoidea. The thumb can be used for precision movements by pressing against the side of the hand or d2.

UPPER EXTREMITY FUNCTION

Estimated performance of primates (in ascending evolutionary sequence) in a hand test standardized for man. The test is applied to each upper extremity individually. Only one extremity is included for brevity.

Basic Function			Maximal score	Tupaia glis	Potto	Tarsius	Cebus	Papio	Chimpanzee	Homo sapiens

		TOTAL	100	24	24	24	28	45	57	100

SCORING ITEMS 1 TO 32

3—Performs test normally.

2—Completes test, but uses abnormal movements, takes abnormally long time or has great difficulty. (Abnormal movements include using grasp instead of grip in items 5 & 6, pinch in items 7, 8 or 9, lateral prehension in items 11 to 26).

1—Performs test partially.

0—Can perform no part of test.

Cercopithecus and *Erythrocebus* have relatively short thumbs and pick up small objects between the thumb and the side, rather than the ball, of d2. D2 and d3 are not controlled independently.

In *Cercocebus albigena,* as well as macaques and baboons, the ball of d1 is used against the ball of d2 in fine picking movements. In these groups the index finger, as well as the thumb, is independently controlled. In the baboon there may be separate control of all digits.[1]

6. **Hominoidea:** Anthropoid apes and men have a high degree of fine control with independent control of the digits and some power to place the ball of d1 against d2.

The final major development in the hand was rotation and true oppostion of the thumb. Brachiation apparently discouraged the development of the thumb[10] and because of this fact, there is some reason to question man's descent from brachiators.[11,12]

A world-wide decrease in forests and expanded grasslands may have accounted for the desertion of the trees by some primates. The use of bipedal locomotion in an upright position would then have released the hands from any locomotor duties. The upper extremities would then have become available to carry, gather and handle weapons, food and tools.

Napier[2] suggests that earliest man had power grip between the thenar eminence and the four fingers, but lacked precision grip between the balls of the thumb and the other four fingers. He suggests that the ability to rotate the thumb into a position opposite the fingers was limited in early man, but evolved as man used the hand for precision purposes.

Some time in the Early Pleistocene age (perhaps as early as about 2 million years ago, if recently determined dates for Olduvai Gorge, Tanganyika, are correct) man changed from a tool-user to a tool-maker. The development of sedentary cultures with town, agriculture and commerce, probably started in the eastern Mediterranean basin around 9,000 years ago—about 2,000 years after the end of the last glacial age in Europe.

The development of the brain, the hand, binocular vision and speech allowed man enormous development of imagination, tempered by experience, informed by conceptual tools and disciplined by the scientific methods. Progress in hand function has resulted from the development of powers already anatomically present in monkeys, but not in use. Wood Jones[9] has pointed out that the monkey hand has all the muscles, joints and bones necessary to perform all the motions that man can perform with his hand.

Estimated Scores of Lower Primates in Human Upper Extremity Function Test

The table shows a test developed for evaluation of hand impairments in man.[6] From what is known of hand activity in the primates,[1,4,5] an estimate of what they could do in the hand test has been attempted. A tree shrew (*Tupaia glis*), a lemur (*Potto*), *Tarsius,* a New World monkey (*Cebus*), and Old World monkey (*Papio*), a great ape (*Chimpanzee*) and *Homo sapiens* have been selected to illustrate differences in hand function. Items 1 to 4 consist of lifting blocks of various sizes from a flat table to a shelf at the rear of the table. This is best performed by a hand in which the thumb is opposite the fingers, but the thumb does not have to be truly opposable. In the tree shrew the larger blocks could not be handled because of their size. The fingers of the shrew are able to close around small objects; however, this would be a clumsy way in which to handle the blocks, and the tree shrew is given a score of only two out of three on this test. It is not until one reaches the anthropoid apes that one finds a hand large enough, and with a thumb in the position, to arch the largest block.

Items 5 and 6 require gripping two pipes in holders. These activities can be done well by all primates.

Items 7, 8 and 9 test lateral prehension, pronation and supination. Turning a key in a lock requires finger tip control between d1 and the side of d2. This can be done only by the Cercopithecoidea, the anthropoid apes and man.

Items 10 to 26 test the finest movements, that is, pinch between the balls of various fingers and the thumb. A ball three inches in diameter can be handled by most species fairly well. When it comes to pinch between the thumb and the other digits, only man can do this with any facility. The baboon and possibly the macaque are suspected of having independent control of d3, d4 and d5,[1] but it is doubtful that they could pick up small objects

between the ball of d1 and the ball of d3, d4, or d5 individually.

Items 27 and 28 consist of placing, first, a washer and, secondly, a heavy iron in various positions. Most of the primates are unable to lift a washer from a flat table. The iron requires power grip which is available to most primates, but the iron actually used in this experiment is too heavy to lift for all except the larger monkeys and anthropoid apes.

Items 29 to 31 consist of pouring water from a pitcher to a glass, picking up a glass and pronating and supinating it. This activity can be performed by some of the anthropoid apes but not without spilling and clumsiness.

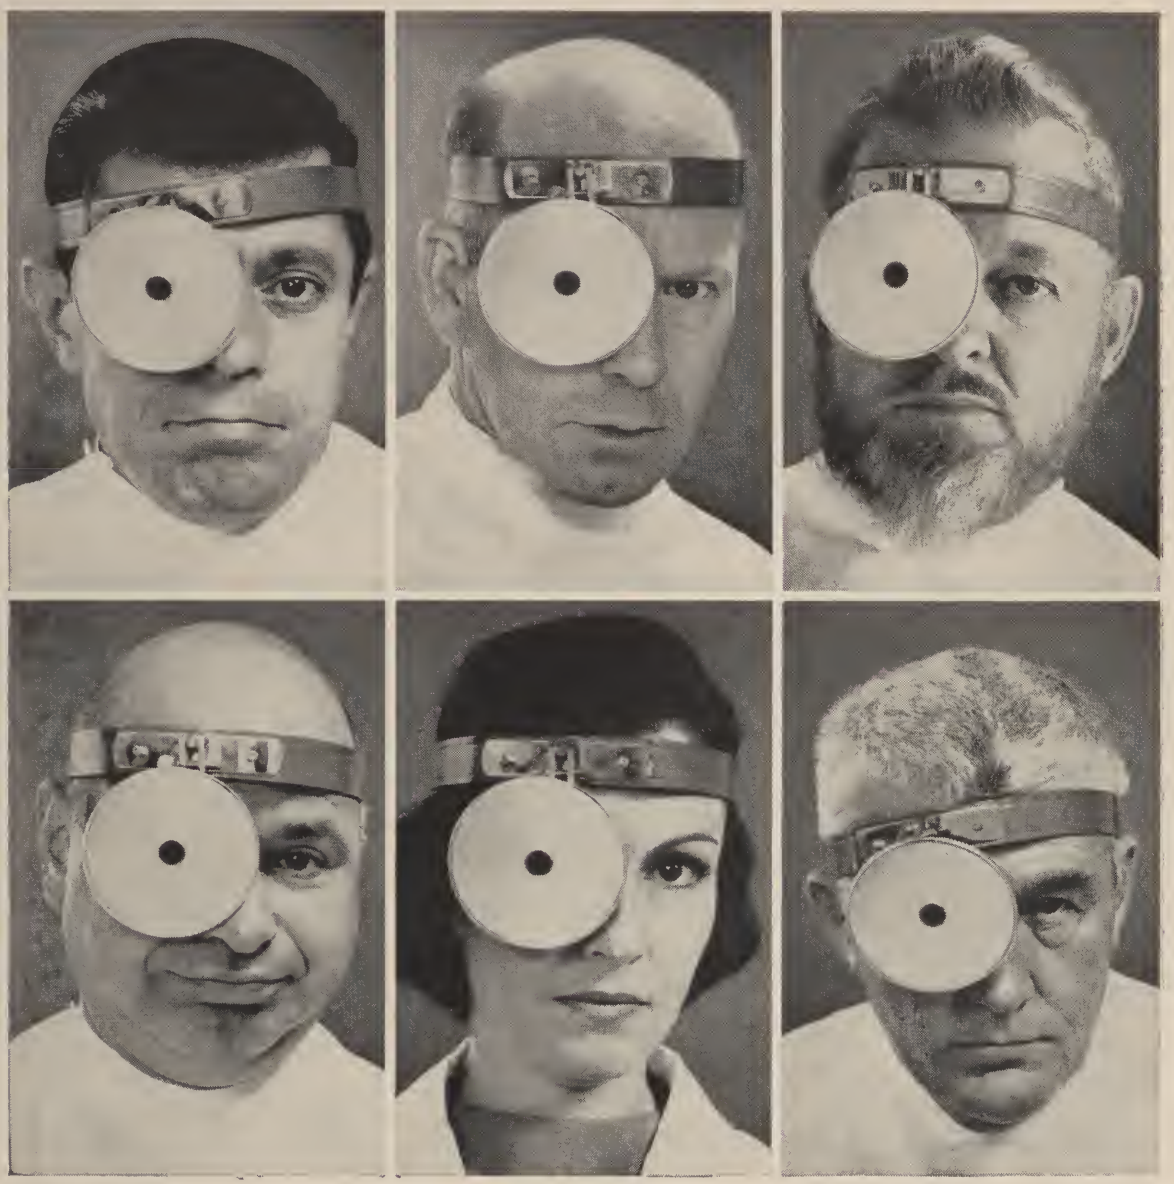
Item 32, writing the name, has not yet been accomplished by species other than man.

Items 33 to 36 are designed to test shoulder and elbow mobility and can be performed by all primates.

Discussion

Despite the inaccuracy of grading the various primates included in this table, and despite the fact that the test may not be an accurate conspectus of man's hand activity, it is nevertheless clear that there is a very remarkable difference between what the higher monkeys and anthropoid apes are able to perform (or commonly perform in their everyday activities) and the rich variety of hand activity available to and used by man.

Current research in the field of hand evolution has been largely concerned with comparative anatomical features of the hand.[7,8,9] A few attempts have been made to relate form to function.[1–4] This paper has attempted to see hand function in lower forms in relation to hand function in man. The major advantages of man's hand are the opposability of the thumb to the tips of the fingers and individual finger movement. It is possible that this crude attempt to compare hand function in Primates may lead to a more accurate description of hand function.



It is a curious observation[9,13] that the rhesus monkey has a hand that has all the physical (muscle, nerve and bone) structures necessary to perform all the functions performed by the human hand, yet lacks the association areas in the brain to synthesize and coordinate movements necessary for tool-making. It is as though the hand were awaiting the development of the brain to be put to full use. One wonders how such a remarkably complex structure, with potential function far beyond its actual use by the rhesus, could develop from natural selection. For natural selection should tend to eliminate all those functions not needed to meet important challenges demanded by the environment.

Summary

A description of hand function in serially higher members of the primate series has been summarized from the literature and compared with hand function in man. The important activities of man's hand are grasp (between thumb and the opposed digits), grip (flexion of digits and thumb around an object), lateral prehension (between thumb and radial side of digit 2), and pinch (between the ball of the thumb and digits 2 to 5). The truly opposable thumb and the individual control of the digits give man unique five-precision movements.

"All Otolaryngologists are Alike"

Just look at them and you can see how much they have in common. Besides, they all go through pretty much the same training, and pass the same kinds of tests, and measure up to the same sort of standards. Therefore, all otolaryngologists are alike. Right?

Wrong! But that's no more preposterous than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more exacting. In fact, there are at least nine *specific differences* involving moisture content, purity, potency and speed of tablet disintegration, which make the manufacture of Bayer® Aspirin so different.

These Bayer standards result in significant product benefits, including gentleness to the stomach and product stability, that enable Bayer Aspirin tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that *all* aspirin tablets are alike, you can say, with confidence, that "it just isn't so."

You might also say that all otolaryngologists aren't alike, either.

Let's get
down to earth
about
diuretics

With Hygroton, you'll discover that you can almost always use fewer tablets than is possible with other diuretics.

You may be told that a new short-acting diuretic was found more effective than Hygroton in congestive heart failure—but this was when twice the manufacturer's maximum recommended dose was given.* At the maximum recommended dose for both diuretics, two tablets of Hygroton were far and away more effective than five tablets of the other diuretic in producing natruresis and weight loss. And at these dosages, Hygroton costs only ⅓ as much as the other diuretic.

Since the discovery of chlorothiazide, the trend has been away from short-acting, multiple-dose, high-cost diuretics. With Hygroton you can usually do the job with just one tablet a day, or every other day.

More than any of the newer diuretics, Hygroton brings dosage and cost of medication down to earth.

*Brest, A. N., et al.:J. New Drugs 5:329, 1965.

Hygroton®
chlorthalidone

Indications: Hypertension and many types of edema involving retention of salt and water. **Contraindications:** Hypersensitivity and most cases of severe renal or hepatic disease. **Warning:** With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind. **Precautions:** Reduce dosage of concomitant antihypertensive agents by at least one-half. Discontinue if the BUN rises or liver dysfunction is aggravated. Electrolyte imbalance and potassium depletion may occur; take special care in cirrhosis or severe ischemic heart disease, and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. **Side Effects:** Dizziness, weakness, nausea, vomiting, hyperglycemia, hyperuricemia, headache, muscle cramps, postural hypotension, constipation, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin reactions, including urticaria and purpura, epigastric pain, or G.I. symptoms after prolonged administration. **Average Dosage:** One tablet (100 mg.) with breakfast daily or every other day. **Availability:** Tablets of 100 mg. in bottles of 100 and 1000. For full details, see the complete prescribing information. 6524-V(B)

'Thorazine' is useful as a specific adjuvant in the above named conditions.

The following is a brief precautionary statement. Before prescribing, the physician should be familiar with the complete prescribing information in SK&F literature or *PDR*. *Contraindications:* Comatose states or the presence of large amounts of C.N.S. depressants. *Precautions:* Potentiation of C.N.S. depressants may occur (reduce dosage of C.N.S. depressants when used concomitantly). Antiemetic effect may mask other conditions. Possibility of drowsiness should be borne in mind for patients who drive cars, etc. In pregnancy, use only when necessary to the welfare of the patient. *Side Effects:* Occasionally transitory drowsiness; dry mouth; nasal congestion; constipation; amenorrhea; mild fever; hypotensive effects, sometimes severe with I.M. administration; epinephrine effects may be reversed; dermatological reactions; parkinsonism-like symptoms on high dosage (in rare instances, may persist); weight gain; miosis; lactation and moderate breast engorgement (in females on high dosages); and less frequently cholestatic jaundice. Side effects occurring rarely include: mydriasis; agranulocytosis; skin pigmentation, lenticular and corneal deposits (after prolonged substantial dosages).

For a comprehensive presentation of 'Thorazine' prescribing information and side effects reported with phenothiazine derivatives, please refer to SK&F literature or *PDR*.

Prosthetic Replacement of Heart Valves

SAFUH ATTAR, MD
Associate Professor of Thoracic Surgery
ELIJAH SAUNDERS, MD
Instructor in Medicine and Cardiology
University of Maryland School of Medicine

The prognosis of cardiac patients with acquired valvular heart disease has been altered favorably since the introduction of prosthetic valves. Although a large number of prosthetic valves are available, the Starr-Edwards caged ball valve prosthesis has been subjected to human implantation more often than any other prosthesis. This report summarizes the clinical experience with this prosthetic valve at the University of Maryland Hospital.

One hundred and twenty-four patients underwent prosthetic valve replacement during the past four years, 77 having mitral valve replacement, 36 aortic valve and 11 replacement of both aortic and mitral valves. So far we have not replaced any tricuspid valves, although 4 patients included in the present series had plication of insufficient tricuspid valves, simultaneously with replacement of mitral and/or aortic valves. The patients varied in age from 20 to 68 years, the majority being between the fourth and sixth decades of life. In mitral valve disease the indications for valve replacement were restenosis after adequate valvulotomy, severe calcification, mitral insufficiency, and combined stenosis and insufficiency of significant degree.

In aortic valvular disease the indications for valve replacement were incapacitating symptoms (congestive heart failure, angina, etc), hemodynamic evidence of severe stenosis and/or insufficiency. The latter was considered hemodynamically significant in the presence of a wide pulse pressure and marked regurgitation by cineangiography. Most patients were subjected preoperatively to right and left heart catheterizations to assess the significance of the lesions. The majority of patients with mitral valve disease had combined stenosis and insufficiency whereas the majority of patients having aortic valve surgery had predominantly aortic stenosis.

The technique of cardiopulmonary by-pass which is required for valve replacement has been greatly simplified with the use of hemodilution, since it minimizes the need for large quantities of heparinized fresh blood.

The immediate survival rate (within 30 days of surgery) in mitral valve replacement was 80%,

and in aortic valve 66%. Only 4 patients with double valve replacement survived surgery. The beneficial result of surgery was maintained in the long term follow-up of patients with aortic valve replacement. In the mitral group, however, the delayed complications leading to mortality decreased the survival rate from 80% to 60%. These complications are due mostly to thromboembolic disease, prosthetic detachment and bacterial endocarditis related to the prosthesis. Our experience so far suggests that long term anticoagulation and elimination of all foci of infection both pre- and postoperatively have significantly diminished these complications.

Although the mortality and morbidity associated with valve replacement appear high when compared with other types of surgery, we recognize that most of these patients are categorized as Class III and IV according to the American Heart Association functional classification, and are severely ill. If better results are to be obtained, it would seem advisable not to allow patients with acquired valvular heart disease to progress into functional Class IV before being offered the benefits of valve replacement.

MOTHERS AND ASTHMA

Psychiatrists have generally agreed on one primary cause of childhood asthma: the mother. Something in the mother's personality sets off the child's dark, hidden fears and anxieties, the theory goes. This, in turn, produces allergic reactions in the child which constrict the bronchial tubes and make breathing difficult or even painful.

But what kind of woman is involved? To better describe her, 14 psychiatrists, pediatricians, and clinical psychologists were asked to sort and choose from among 100 definitions of the asthmatogenic, or asthma-causing mother. A report on their definitions appears in a current publication of the American Medical Association, the December issue of the *Archives of General Psychiatry*.

"On the whole," the report said, "clinicians tend to agree that the asthmatogenic mother is concerned with her own adequacy, is self-defensive, protective of others, sensitive to demands, in need of reassurance from others, irritable, and tends to feel guilty."

She is further described in the report as "not calm and relaxed, not submissive, not skilled in the social techniques of play and humor, and as neither rebellious nor non-conforming." The authors stress, however, that asthma is a complex phenomenon. Its cause cannot entirely be blamed on the mother. In some instances the children's physical makeup seemed to be more a cause of their asthma than their psychological relationships with their mothers, the report said.

The authors are Jeanne Block, PhD, Elinor Harvey, MD, Percy H. Jennings, MD, and Elaine Simpson, MA.

"Take a laxative" is a harsh sentence

Although there are more than 60 ethical laxatives available for the constipated patient, many, unfortunately, do not really produce an effect much like a normal bowel movement. Instead they whip the bowel, torment it and leave it irritated, inflamed and exhausted.
On the other hand, Dulcolax provides a nearly normal movement. Through its unique contact action, it induces the kind of natural contraction waves of the colon necessary for gentle, complete, comfortable bowel movements.
For your next constipated patient, try Dulcolax the laxative with the gentle touch.

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed ... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

700121

Ilosone®

Lilly

Erythromycin Estolate

(See next page for prescribing information.)

Ilosone®/ the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by microorganisms sensitive to its action (especially staphylococci, hemolytic streptococci, and pneumococci). The drug is therefore useful in a high proportion of bacterial diseases encountered in clinical practice and particularly in the treatment of bacterial infections of the upper and lower respiratory tract and soft tissues.

In the treatment of acute bacterial pharyngitis and tonsillitis, this antibiotic has promptly eradicated the bacteria (streptococci) and has produced a parallel prompt clinical improvement. There have been no group A beta-hemolytic streptococci resistant to this preparation. In beta-hemolytic streptococcus infections, treatment should be maintained for ten days to prevent the development of rheumatic fever or glomerulonephritis.

Erythromycin estolate has proved to be very effective in pneumococcus pneumonia and in acute bronchitis with pneumococci on culture. Bronchopneumonia and otitis media in children have responded well to its use.

The antibiotic has been used very successfully in staphylococcus infections. Good therapeutic results have been obtained in soft-tissue infections, abscesses, cellulitis, carbuncles, wound infections, and furunculosis.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents. As is the case with any treatment regimen used in these severe conditions, surgical procedures should be performed when indicated, and large dosages of the antimicrobial agents should be employed. In this fashion, Ilosone has been effective in staphylococcus pneumonia, osteomyelitis, septicemia, empyema, and meningitis.

Multiple 500-mg. doses of the drug have been useful in gonorrhea and syphilis. Since penicillin is the drug of choice for the treatment of syphilis and gonorrhea, erythromycin estolate should be employed for these infections only in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients known to be hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

Side-Effects: Data obtained from seven years' use of propionyl erythromycin ester and erythromycin estolate (Ilosone) indicate that hepatic dysfunction with or without clinical jaundice may occur during or following courses of therapy with the drug.

Changes in liver function tests in such cases have been indicative of intrahepatic cholestasis. The symptoms appear to be the result of a form of sensitization. The initial symptoms have appeared in some cases after a few days of treatment but generally have followed one or two weeks of continuous therapy or several courses of the drug. Symptoms reappear promptly if the drug is readministered to sensitive patients, usually within forty-eight hours. Eosinophilia was noted in peripheral blood counts. The findings readily subsided without apparent residual effects when treatment was discontinued. Recovery was delayed in one reported instance. The physician indicated in this case that either drug-induced jaundice or viral hepatitis may have been responsible for the findings.

In one clinical study involving ninety-three patients treated with the antibiotic, three cases of jaundice were observed and an additional eleven cases developed some changes in liver function tests. Three of the patients had abnormal liver function tests a second time on readministration of the drug.

Even though it is assumed that not all cases of jaundice have been reported, it seems clear that the number is small compared with the amount of drug that has been used. Reported cases have included persons in whom there had been administered other drugs known to be associated at times with hepatic side-effects and cases in which the presence of viral hepatitis or other disease may have been responsible for the findings. In some of the cases, associated gastro-intestinal symptoms simulated the colic of biliary tract disease. In other instances, clinical symptoms and results of liver function tests resembled findings in extrahepatic obstructive jaundice. It appears that the occurrence of jaundice after administration of Ilosone is infrequent, but further investigations are being made to estimate its incidence more accurately.

In those cases mentioned above in which jaundice appeared to be definitely related to use of the drug, laboratory findings we characterized by increased direct-reacting bilirubin, elevat alkaline phosphatase levels, negative or weakly positive cephal flocculation and thymol turbidity tests, elevated serum glutar oxalacetic transaminase levels, peripheral eosinophilia, and n mal cholecystograms.

Individual idiosyncrasy seems evident since jaundice has n been reported in other patients taking prolonged courses of t medication. Patients with chronic infection have been given 1 to 2 Gm. of the drug daily for periods of two to six months, a patients with rheumatic fever have taken prophylactic doses 0.5 Gm. daily for two years without difficulty. In one group 144 patients who received the drug daily for two years, no jau dice was noted. It was of interest that members of six of the patients' families, who were not taking the drug, had episod of jaundice during the study period.

Transaminase and serum alkaline phosphatase levels we determined in a group of fifty-four adults and children who to 250 mg. of Ilosone daily for an average of sixteen months rheumatic fever prophylaxis. The results were compared wi those of a similar group of forty-four patients who received pe icillin. There were no cases of jaundice in either group. Elevati of SGPT and serum alkaline phosphatase levels during the cour of treatment was observed in one patient treated with Ilosо and in two patients treated with penicillin. Seven other patie in the group receiving Ilosone and four others in the penicill group showed elevations in one of the tests at some time duri administration of the drugs.

Very satisfactory therapeutic results, without toxicity, we reported in 102 pediatric patients who received short-term (te day) courses of Ilosone in the treatment of streptococcus inf tions. Results of liver function tests in these patients were co parable to those in a similar control group who had receiv penicillin.

Gastro-intestinal disturbances not associated with hepatic e fects are observed in a small proportion of individuals as a res of a local stimulating effect of the medication on the alimenta tract; however, the normal intestinal gram-negative bacteri flora is not appreciably altered by erythromycin drugs.

Although allergic manifestations are uncommon with the u of erythromycin, there have been occasional reports of urticar skin eruptions, and, on rare occasions, anaphylaxis.

Administration and Dosage: Ilosone is administered orally.

Ilosone Pulvules®
Ilosone Chewable Tablets
Ilosone Drops
Ilosone, 125, for Oral Suspension

For infants and for children under twenty-five pounds of bo weight, the usual dosage is 5 mg. per pound every six hours; f children twenty-five to fifty pounds, 125 mg. every six hou (Tablets Ilosone Chewable should be chewed or crushed a swallowed with water.)

For adults and for children over fifty pounds, the usual dosa of Ilosone is 250 mg. every six hours.

For severe infections, these dosages may be doubled.

When larger doses are indicated, parenteral erythromyc therapy should be considered.

In the treatment of syphilis, the recommended total dosage 20 to 30 Gm. given in divided doses for a period of ten to fifte days. Close follow-up of the patient is necessary since erythr mycin drugs have not had adequate evaluation in all stages syphilis. Examinations of spinal fluid are recommended as pa of the follow-up therapy.

For gonorrhea, 500 mg. four times a day for four days a recommended. In the treatment of gonorrhea, patients with suspected lesion of syphilis should have a dark-field examinati before receiving antibiotics, and monthly serologic tests shou be made for a period of three months.

How Supplied: Pulvules Ilosone, Capsules, N.F., 125 and 250 m (equivalent to base), in bottles of 24 and 100.

Tablets Ilosone Chewable, N.F., 125 mg. (equivalent to base in bottles of 50.

Ilosone Drops, 5 mg. (equivalent to base) per drop, in 10-c size packages, with dropper calibrated at 25 and 50 mg.

Ilosone, 125, for Oral Suspension, N.F., 125 mg. (equivale to base) per 5-cc. teaspoonful, in 60 and 150-cc.-size packag

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

Emergency Help Needed for Poisoned People

VERNELLE FOX, MD
Medical Director, Georgian Clinic
Atlanta, Ga

One of the most pressing needs not only in the Atlanta area but also, I am sure, in every community in the state, is for detoxification centers. What is a detoxification center? It is a small medical unit geared to treat people with all kinds of poisoning, and it logically should be run in conjunction with the emergency rooms of general hospitals and staffed by especially trained personnel.

People in urgent need of such a facility range from paying private patients to those who cannot afford medical care; and this includes those with overdoses of drugs, poisons and/or alcohol—whether by accident or suicide attempts. These patients are acutely and severely ill, and may die if not treated immediately and adequately. Most people would need a detoxification center for only two to four days before they could either go home or go to a general medical or psychiatric facility.

One of the tragedies of our society is an alcoholic who is sincerely trying to get off a "bender" and who is unable to secure sufficient help to get detoxified in order to become "clear" enough to get to a clinic, Alcoholics Anonymous, or any other source of help. He is caught in a medical rat maze—help is there if he could be helped to get it!

Reprinted with permission from *THE NEW LIFE*, publication of The Alcoholic Rehabilitation Service of Georgia.

Even if he has money and a private physician, his doctor and the hospital are frequently unable to offer him the needed help because they do not really know how to treat him. If the hospital had a detoxification unit, the physician could have the help of especially trained nurses and attendants, and the hospital would probably not be so hesitant to accept him.

If he is without money, he should be able to receive the services of the City Hospital like any other patient. He is as sick and has as great a chance of dying as does the patient recovering from surgery. All too frequently this is not the case. As it now stands, a fellow may be picked up by the police, held in jail for four hours, and then turned loose. This four hours sobers him up just enough for him to be sick and a candidate for the hospital. But, since the needed facilities are not available, he is turned into the street or "does time," as the case may be. Neither one contributes to his recovery in the vast majority of cases.

Recent Federal District Court rulings have indicated that the sentencing of an alcoholic for simple drunkenness is illegal. We have long known that sentencing for drunkenness was useless more often than not. This ruling is eventually

Only JOBST supports are custom made from precise measurements of the individual extremity.

JOBST Service Centers:
818 Eighteenth St., N.W.
Washington, D.C. 20006 — Ph. 298-5530
Suite 415 Medical Arts Building
101 W. Read St., Baltimore, Md. — Ph. 539-0560

When the patient's extremity is carefully measured with the unique JOBST Measuring Tape, it marks the second step toward providing him with a custom-made VENOUS PRESSURE GRADIENT support. The first step begins with a prescription. Your prescription. With your diagnosis and indication for the correct counter pressures to be engineered into the support. JOBST supports are widely used in treatment of stasis dermatitis, postmastectomy lymphedema, postural hypotension, post-fracture, post-operative and injury edema. Trained experts will measure and fit your patients for you at one of our convenient Service Centers.

© JOBST, 1966

going to make all communities look at the alternatives, and a logical place to begin is to have available adequate medical attention for the sick, "poisoned" individual who is trying to get detoxified.

It is high time to stop hiding behind the idea that "he got himself into this, now let him get himself out." The diabetic who has been off his diet "got himself into" acidosis, but we still offer him good medical attention. The time has also passed for those of us interested in the care of the alcoholic to stop sitting and fussing about the fact that "doctors and hospitals won't treat them" and begin to look at why services are not available.

There are many factors involved in this and they undoubtedly vary in each community. Very certainly, one common area is the lack of "know how." This "know how" can be developed in a small group of "specialists." In other words, a team consisting of a few nurses and a doctor from any hospital could be trained in this specialized area. Another common problem is the fear of disrupting the hospital's routine by the admission of a "drunk." This too, could be avoided by a detoxification unit as a "drunk" isn't drunk after twenty-four to seventy-two hours, but is either well enough to go home and/or to clinics, or is sick enough to be in a general medical bed.

Another factor in the past has been the hospital's fear, often based on experience, of being "stuck" with the patient for an indefinite period of time. Today, almost every community has a good Alcoholics Anonymous group and, very rapidly, more and more Health Departments will have clinics. Patients can be referred to these agencies as soon as they are physically able, and the general hospital does not need to undertake his long-term care.

What can each of us do in our community to interest responsible people in evaluating the situation in our own facilities? If local groups were to study the existing situation and needs and use a little imagination, I feel sure they could devise a way of tackling the problem.

It is time to stop merely being critical of the lack of services, and to start looking determinedly for ways and means of being useful to those who can help treat people in stages of acute poisoning, including alcoholism.

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, *Commissioner*

HIGHLIGHTS

Women's Conference on Health

Approximately 60 women recently attended a two-day Public Health Conference for Women Leaders, conducted by the Department's Health Information and Education Services. To encourage community interest in health issues and cooperative support of health programs, the conference featured pertinent presentations by the Commissioner, the Deputy Commissioner and various program directors, followed by small group discussions.

Enthusiastic response indicated a desire for further health symposia and intentions to investigate local needs and to enlist the active participation of other organizations.

Grant for Air Survey in Allegany County

Federal approval has been received of the application for a three-year grant requested for an air quality survey in Allegany County. Funds allowed by the Division of Air Pollution, U. S. Public Health Service, amount to $24,843 for the first year. This will be combined with $8,281 in State and local funds for a total of $33,124 for this project in its initial year.

Solid Waste Disposal Project

Another joint Federal-State-local activity now under way in Allegany County is a three-year demonstration project using abandoned strip mines as landfills for disposal of solid wastes. With the help of a $126,318 grant from the U. S. Public Health Service and the leasing of a 21-acre strip mine by Allegany County Commissioners, the Division of Solid Wastes hopes by project termination to demonstrate satisfactory means not only of refuse disposal, but also of land reclamation and reduction of surface water pollution by mine acid drainage. Included in the three-year plan is the experimental combination of sewage sludge with solid wastes. Laboratory testing of ground and surface water samples will be done in cooperation with the Department of Water Resources.

Success of the project may open the way to use of approximately 2,240 acres of abandoned mine pits in western Maryland for solid waste disposal.

Medical Care Studies Chief Appointed

Dr. Miriam Sachs has been appointed Chief, Division of Medical Care Studies, a post created under the recent reorganization as an outgrowth of the Department's responsibility for quality of care under Title XIX.

Dr. Sachs received her MD degree from the Columbia College of Physicians and Surgeons and her MPH degree from Columbia School of Public Health and Administrative Medicine. She has served in several capacities with the New Jersey State Department of Health, including District State Health Officer of the Metropolitan District, and with the U.S. Public Health Service. She is a diplomate of the Board of Preventive Medicine

Chesapeake Manor

NURSING HOME

24 hour professional care

Registered nurses

Physical therapy facilities

Pleasant and distinctive atmosphere

Warm, cheerful hospitality

The cost is moderate

Chesapeake Manor Nursing Home introduces a new standard of dignity and pride for convalescents. Family-fashion rooms and pleasant informal lounges avoid all sense of the institutional. Excellent facilities and competent personnel assure the comfort and care you would wish for your family or friends.

509 East Joppa Road — Towson, Maryland, 21204 — Phone 828-9494

and Public Health and of the Board of Occupational Medicine.

Family Planning Standards Published

The Department granted permission to the National Planned Parenthood Association to publish, and distribute nationwide, copies of "Standards and Procedures of Family Planning Service and Clinics." This "Guide for Local Health Departments" was developed jointly by the Department's Divisions of Public Health Nursing and of Maternal and Child Health.

Shortage of Physical Therapy Assistants

Returns from surveys of health care facilities in the State indicate that two hundred physical therapy assistants could be used immediately, if they were available. The Division of Physical Therapy is cooperating with the American Physical Therapy Association of Maryland in developing a training program to provide assistant manpower for physical therapists and other professions concerned with restorative and rehabilitative services. This is not expected to be accomplished until 1968, however.

Birth Rate Continues Decline

During 1965, there were 4,866 fewer babies born to Maryland residents than in 1964. The 74,137 total is the lowest recorded since 1956, according to the *Annual Vital Statistics Report, 1965*. Declines were registered in all but two counties, reflecting a nationwide downward trend which began in 1957.

Deaths occurred at the rate of 8.7 per 1,000 population, a rise of two percent over the 1964 rate. The chief causes—heart disease, cancer, and stroke—showed small increases, while deaths from accidents and cirrhosis of the liver rose considerably. Infant mortality reached an all-time low of 24.8 per 1,000 live births.

Copies of the report are available from the Division of Biostatistics, Maryland State Department of Health, 301 West Preston St, Baltimore, Md 21201.

Learn To Do Your Part In The Prevention Of Disease

Medical History Capsule

Robert E. Farber, MD, the city's commissioner of health, placed a "medical history capsule" in a vault in a lobby wall of the new Mount Vernon Medical Building in a special ceremony on November 29. Inserted in the metal capsule were copies of US Public Laws 89-97 and 89-239, and of the current issues of *The Journal of the American Medical Association,* the *Maryland State Medical Journal,* the Baltimore City Medical Society *Bulletin* and the city's daily newspapers.

In commenting on its contents, Dr. Farber said, "The two public health laws which have been included in this capsule . . . represent probably the most significant health legislation passed by the Congress of the United States since the original Social Security Act of the early 30's. These laws have the potential for radically changing the practice of medicine as we have known it in this country . . . medicine is at the gateway of a new era which will be of great benefit to the people of the United States."

The capsule, which is destined to be opened by the city's commissioner of health in the year 2066, will be identified by a plaque on the sealed wall.

Robert E. Farber, MD, inserting capsule to be opened in 100 years.

Maternity Project

The Maternity and Infant Services Project 501 of the Baltimore City Health Department has been expanded by the addition of eight social workers. This will enable the Baltimore Maternity Center to provide enough social workers in the health district clinics to assure (1) identification of the social problems of more patients in the maternity and infant groups, and (2) follow-up on all patients with such problems until the baby is one year of age.

At the Baltimore Maternity Center all adoles-

cent patients, all patients requesting adoption information, and all patients with a history of mental illness, mental retardation, or housing and financial problems, are screened by a social worker, who ascertains the nature and the severity of the problems so that patients can be referred to the agencies best able to assist them. The expansion will allow better use of, and coordination with, such services as the Department of Public Welfare, Public School No. 1 for pregnant school girls, and the social services departments of hospitals and private adoption agencies. If these services are for some reason not available to certain patients, the Maternity and Infant Services Project 501 will be able to give assistance through its own program.

Social work services in the Maternity Project are under the supervision of Mrs. Naomi H. Evans, newly promoted to Chief of Social Services. The Baltimore Maternity Center is located at 211 West Lombard Street; the telephone number is 752-7282.

REGIONAL WEATHER FORECAST

Record Low Temperatures and Heavy Rain Followed by Cough, Stuffed and Runny Noses and Aches and Pains.

Tussagesic breaks up coughs, quickly clears stuffed and runny noses and relieves aches and pains. Provide coverage of the tough cold for up to 24 hours with just a single timed-release tablet dosed morning, midafternoon and at bedtime.

each

Tussagesic®

timed-release tablet contains:

Triaminic® (phenylpropanolamine hydrochloride 25 mg., pheniramine maleate 12.5 mg., pyrilamine maleate 12.5 mg.)	50 mg.
Dextromethorphan hydrobromide	30 mg.
Terpin hydrate	180 mg.
Acetaminophen	325 mg.

Dosage: Adults—1 tablet, swallowed whole to preserve timed-release feature, in morning, midafternoon and at bedtime. *Side effects:* Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. *Precautions:* The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

New drugs take exams, too.

Today, virtually every medical school in the United States cooperates with pharmaceutical manufacturers in the clinical evaluation of new and promising drugs. Just as you might find it significantly more difficult to practice medicine without the useful new compounds made available through original pharmaceutical research in the past twenty years—prescription-drug manufacturers would find it equally difficult to obtain extensive, long-term, dependable evaluations of new therapeutic agents without the close cooperation of medical staffs and clinical facilities of medical schools and teaching hospitals. Such cooperation leads toward more effective care of more patients—the common goal of medical and pharmaceutical research—toward reduction in the cost of disease, toward increase in useful longevity.

This message is brought to you as a courtesy of this publication on behalf of the producers of prescription drugs.

STATE OF MARYLAND

Department of Mental Hygiene

Isadore Tuerk, MD, Commissioner

Kurt Gorwitz, Statistics Director

The Hospitalized Adolescent

Last year more than 400 children between the ages of 12 and 17 were treated in Maryland's mental hospitals. This is equal to one out of every 1,000 Maryland residents in this age group.

The following table shows the distribution of resident patients (as of July 1, 1965) by diagnosis, age and length of hospitalization. Half were diagnosed as transient situational personality disturbance, one out of six as schizophrenic, and one out of eight as personality disorder. Although most were recent admissions, a number had been under inpatient care for extended time periods.

The adolescents in state mental hospitals represent only a small proportion of those seen in psychiatric facilities. Data available through the Maryland Psychiatric Case Register indicate that 11.5% of all admissions 10-17 years of age were to state hospitals, 6.1% to other inpatient facilities, and 82.4% to clinics. However, they do represent a major portion of those receiving treatment since many of the adolescent admissions to outpatient facilities are seen only for testing, evaluation and diagnosis.

A study released in 1962 indicated a minimum need for 500 residential beds for children,* a number far in excess of the then available resources. In addition to the Institute For Children, which now has 86 patients (most are less than 12 years of age), separate units for adolescents with a combined capacity of 66 are now functioning at the Crownsville and Spring Grove hospitals. former has also established a day care program for a small number of disturbed children from one county. Because of the bed shortage, the majority of adolescents continue to be treated in the same wards with other patients—a policy which is not believed to be conducive to the recovery of either group. Efforts to remedy this chronic deficiency must involve additional construction and staffing both in State hospitals and in other facilities, as well as the close coordination of services with schools and all other present and proposed community resources.

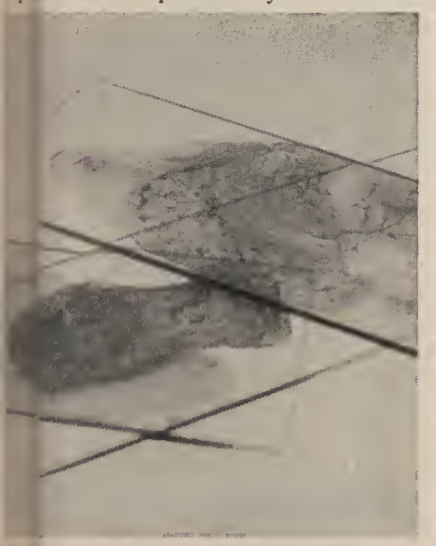
New
low-cost tetracycline/antifungal therapy

for broad-spectrum activity plus specific antifungal prophylaxis at significant patient savings

Whenever tetracycline is indicated in these candidates for Candida:

. diabetic patients



2. nonpregnant women with a history of recent or recurrent monilial vaginitis

3. elderly or debilitated patients

. patients with a past history of moniliasis

5. patients on long-term tetracycline or corticosteroid therapy

BRISTOL THERAPEUTIC SUMMARY: For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule *q.i.d.* Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals. *Supply:* Capsules, bottles of 16. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin.

BRISTOL LABORATORIES
Division of Bristol-Myers Company

Solutions to Business Problems in Daily Medical Practice

The Keogh Plan: The New Amendment

WILBURN L. McCLURE, JR.

When the President's signature was affixed to "The Foreign Investors Tax Act of 1966" it brought into law several variegated and unrelated amendments. One rider, introduced by Rep. Eugene J. Keogh, was an amendment to the Self-Employed Individual Retirement Act.

Originally the self-employed law permitted the annual contribution of as much as 10% of "earned income" to a retirement fund. There was a ceiling on contributions of $2,500 a year and 50% of that amount, or $1,250, was tax-deferred.

Beginning January 1, 1968, the new law permits the self-employed individual to deduct the *full amount* of his contributions up to 10% of his "earned income" but not to exceed $2,500.

Originally "earned income" (for purposes of the 10% limitation) could not exceed 30% of the net profits *where capital as well as services* was a significant element in the production of income.

Beginning January 1, 1968, the new law defines "earned income" as the net earnings from self-employment. In other words, the 30% limitation no longer applies to restrict the amount of the contribution.

Many self-employed individuals, compelled to include one or more employees in their plan, discovered that the deductible limitation on their own contributions minimized or voided any annual net savings. Some found that contributions toward employees' plans would result in an overall loss, and they therefore did not establish such a plan.

The Self-Employed Individual Retirement Act, as amended, continues to permit employees to enter the plan if certain conditions exist. Even though the plan has been liberalized to increase benefits for the employer, the phase of the law concerning employees should be closely examined, especially by doctors in partnerships before a contract for a plan is signed. Depending upon the number of employees and the percentage of contributions made, employers may continue to find serious limitations where it is mandatory to include the employee in the plan.

Most doctors know the benefits that might be derived from a "Keogh Plan," particularly if they have no employees. Many others have found increased benefits by including their wives when they work as a full-time nurse or secretary. (The latter procedure requires close coordination between the plan salesman and the doctor's tax advisor and, in some cases, the help of the doctor's advisor on estate management.)

Caution: The Keogh Plan, as originally written into law and with its most recent changes, while certainly attractive to many doctors, needs detailed evaluation prior to commitment. Like every other "good thing," this one is not suitable for all comers.

Mr. McClure is director of the Baltimore office of Professional Business Management, Inc. This monthly column is prepared as a complimentary service to the *Maryland State Medical Journal.*

Woman's Auxiliary

MARYLAND
HYGEIA FILIAE
W A M C F

JANUARY, 1967 MRS. HARRY L. BERMAN, *Editor*

Baltimore City

One of the many activities of the Woman's Auxiliary to the Baltimore City Medical Society is Project Handclasp. Presently under the supervision of Mrs. Joseph B. Workman, chairman of the auxiliary's International Health Committee, it has functioned since 1956 with the cooperation of the Christian Overseas Mission Hospitals, a non-profit organization handling a sample drug program.

Physicians or their wives take drug samples to the Medical and Chirurgical Faculty Building at 1211 Cathedral Street for collection and storage. When there is a sufficient amount, Mrs. Workman takes them to her home where, with the professional guidance of Dr. Workman, the drugs are sorted, separated and evaluated for shipping, in accordance with the strict rules of the Federal Drug Administration.

* * * * *

Mrs. H. Leonard Warres, auxiliary representative to the Faculty's Public Relations Committee, reported at the November 30th meeting of the auxiliary's board of directors that the possibility of bringing the S.S. HOPE to Baltimore was being explored by the Committee. Mrs. Warres also reported the highlights of the Seminar on the Medical Aspects of Traffic Safety [See p. 45. Ed.], which she had attended on October 12 in her capacity as chairman of the auxiliary's Safety Committee.

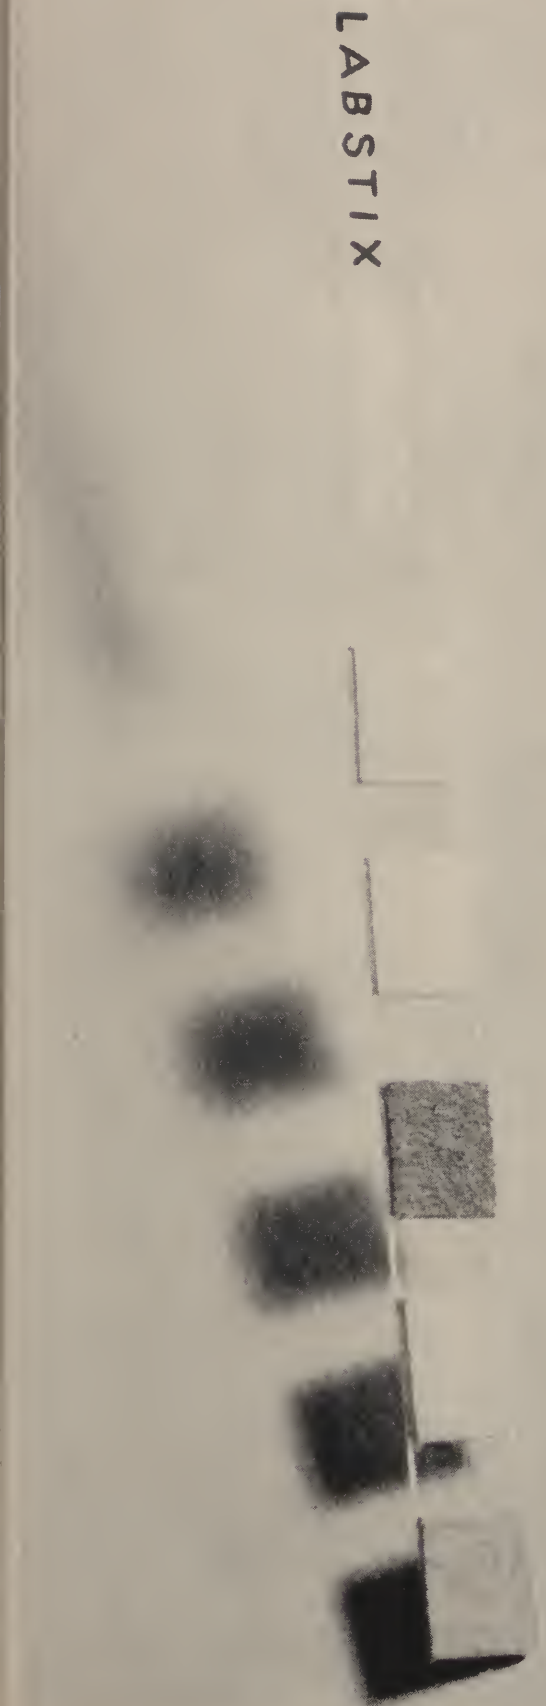
* * * * *

During National Community Health Week, at the request of the Medical Society, auxiliary members distributed 100 posters advocating careers in medicine and allied fields. They were displayed in schools, hospitals, libraries and community stores.

* * * * *

On November 14 and 15, thirty-five BCMS auxiliary members and their friends provided voluntary help at the Diabetic Detention Clinic in the Fifth Regiment Armory. They considered this a most gratifying experience.

* * * * *



Mrs. Percy H. Sutley, president, has announced that the next luncheon meeting of the Auxiliary will be in Osler Hall on Wednesday, February 8, at noon, and that the speaker will be Mr. Charles Moylan, Jr., State's Attorney. His topic will be "Crime on our City Streets."

Following Mr. Moylan's talk, there will be a business meeting at which a committee to nominate a slate of officers will be elected.

MARK THESE DATES ON YOUR NEW CALENDAR

new from Ames
5 basic uro-analytical facts in 30 seconds

Labstix®

BRAND REAGENT STRIPS

...broadest urine screening possible from a single reagent strip

Urine test results with LABSTIX Reagent Strips can represent significant guides to differential diagnosis or therapy in many conditions. An unexpected "positive" may enable you to detect hidden pathology—long before more recognizable symptoms become evident. Negative results, which permit you to rule out abnormalities in a broad clinical range, can serve as baseline values for reference in future examinations. The 5 colorimetric test areas encompassed on LABSTIX Reagent Strips are:

pH—values are read numerically in the essential range of pH 5 to pH 9.

Protein—results are read either in the "plus" system or in mg. % in amounts approximating "trace," 30, 100, 300, and over 1000 mg. %.

Glucose—provides a "Yes-or-No" answer for urine "sugar spill."

Ketones—detects ketone bodies in urine—**both** acetoacetic acid and acetone. Reacts with as little as 5 to 10 mg. % of acetoacetic acid.

Occult Blood—specific test for intact red cells, hemoglobin or myoglobin. Results are read as negative, small, moderate or large amounts.

Now a Clear Reagent Strip of Firm Construction

...facilitates handling during testing procedure. Excellent color contrast made possible by the clear plastic strip, together with the clearly defined color charts provided, permits precise, reproducible colorimetric readings in all 5 test areas. A more definitive interpretation of uro-analytical facts is made possible.

Available: LABSTIX Reagent Strips, bottles of 100 (color charts are supplied with each bottle).

fluocinolone acetonide — an original steroid from

SYNTEX

LABORATORIES INC., PALO ALTO, CALIF.

controls infected inflammatory dermatoses that start from scratch

Neo-Synalar®
(fluocinolone acetonide-neomycin sulfate cream)
Cream

The "itch-scratch" cycle usually associated with inflammation often results in infected dermatoses because broken skin surfaces are particularly vulnerable to pathogenic bacteria.[1] To treat infected inflammatory dermatoses, Neo-Synalar Cream combines the most active topical corticosteroid with a highly reliable antibiotic generally reserved for topical application.

In Neo-Synalar, fluocinoline acetonide controls the inflammation and provides rapid relief from associated pruritus. At the same time, its antibacterial component—neomycin—combats superficial infection caused by many gram-positive and gram-negative bacilli[2] that often colonize and thrive on abraded skin.[1]

A specially formulated vanishing cream base that is greaseless and odor free makes Neo-Synalar cosmetically appealing, and encourages greater patient cooperation.

controls the infection

stops the scratch

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of its components. **Precautions:** Neomycin rarely produces allergic reactions. Prolonged use of any antibiotic may result in overgrowth of nonsusceptible organisms; if this occurs, appropriate therapy should be instituted. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. **Side Effects:** Side effects are not ordinarily encountered with topical corticosteroids. As with all drugs, however, a few patients may react unfavorably to Neo-Synalar under certain conditions. **Availability:** Neo-Synalar Cream (0.025% fluocinolone acetonide, neomycin sulfate, equivalent to 0.35% neomycin base), 5 and 15 Gm. tubes.

Now, now, Mrs. Forsythe, we've never lost a cold patient yet.

When she's experiencing acute discomfort from cold symptoms, it's small wonder the patient becomes distressed about her condition.

She will breathe easier when you prescribe Novahistine LP.

Novahistine LP is a long-acting decongestant that helps restore normal mucus secretion and ciliary activity—physiologic mechanisms which prevent infection of the respiratory tract. A dose of two tablets taken in the morning and repeated in the evening will usually keep air passages clear for 24 hours.

Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution patients who operate machinery or motor vehicles that drowsiness may result.

Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

POSITION WANTED

Physician entering service in March desires part time work. Maryland State license . . . John J. Conroy, MD, 242-8887.

POSTGRADUATE SEMINAR

The Medical Genetics Unit of the Department of Pediatrics, Howard University College of Medicine, announces a postgraduate seminar entitled

GENETICS IN MEDICAL PRACTICE

to be held on January 26-27, 1967 in the Preclinical Medical Building of Howard University College of Medicine, Washington, DC. The seminar is directed toward practitioners of medicine and its aim is to enable physicians without previous training in genetics to apply newer genetic knowledge in their everyday work. Topics to be discussed will include congenital malformations, mental retardation, intersexuality, spontaneous abortions, cardiovascular diseases, and cancer. The seminar is supported by the US Children's Bureau. Early registration is encouraged. Call 797-1758 (Area code 202), or write to Mihaly Bartalos, MD, chief, Medical Genetics Unit, Box 101, Howard University College of Medicine, Washington, DC. No registration fee.

The MISSING LINK in Weight Control

Diet Control — **Appetite Control**

and now finally
... the neglected factor

Ex-Caloric Wafers *

Not marketed in combination with any anorexiant drug, since that would limit the dosage flexibility of both.

A SUBSTITUTE FOR FOOD

A DEVICE TO SATISFY THE HUNGER FOR BULK IN PATIENTS ON A REDUCING DIET.

Designed for bulk hunger . . . not laxation!

EX-CALORIC WAFERS CONTAIN NO LAXATIVE HEMICELLULOSE

ESCRIPTION:
tificially sweetened and flavored. Each wafer contains 453 mg. of these non-nutritive, synthetic hydrophilic colloid bulking ents: carboxymethylcellulose 181 mg. and methylcellulose (400 centipoise type) 272 mg. Safe for use by diabetic patients aced on a restricted reducing diet. Usual daily intake less than 3 calories per day.

CTION:
-Caloric Wafers produce such bulk in a part of the alimentary tract as to ordinarily impart a highly satisfactory sense of fullness r those obese patients who complain of an empty feeling ("hollow hunger") when placed on a reducing diet and deprived their between-meal snacks.

DMINISTRATION:
or 4 wafers t.i.d., a.c. or p.c. or mid-morning, mid-afternoon and mid-evening. At least 1 large glass of water must be taken th each dose.

ONTRAINDICATIONS:
-Caloric Wafers are completely innocuous and may be administered with impunity in any necessary quantities to all obese tients, including children and the aged. The only contraindications are acute ulcerative colitis and organic intestinal obstruction.

ROCHE

WHEN ANXIETY IS A SIGNIFICANT COMPONENT OF THE CLINICAL PROFILE

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. Warn against hazardous occupations requiring complete mental alertness. Use caution in administering to addiction-prone patients or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of child-bearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In elderly and debilitated and in children over five, limit dosage to smallest effective amount, increasing gradually as needed and tolerated. In general, concomitant use with other psychotropics is not recommended. Paradoxical reactions have been reported in psychiatric patients and hyperactive aggressive children. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically. Observe usual precautions in presence of impaired renal or hepatic function, impending depression and suicidal tendencies.

Adverse reactions: Drowsiness, ataxia and confusion may occur, especially in elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. Syncope occurs rarely. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis, jaundice and hepatic dysfunction) may develop occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy. Individual maintenance dosages should be determined.

Dosage: Oral—Adults: Mild to moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d.

Supplied: Capsules, 5 mg, 10 mg and 25 mg—bottles of 50.

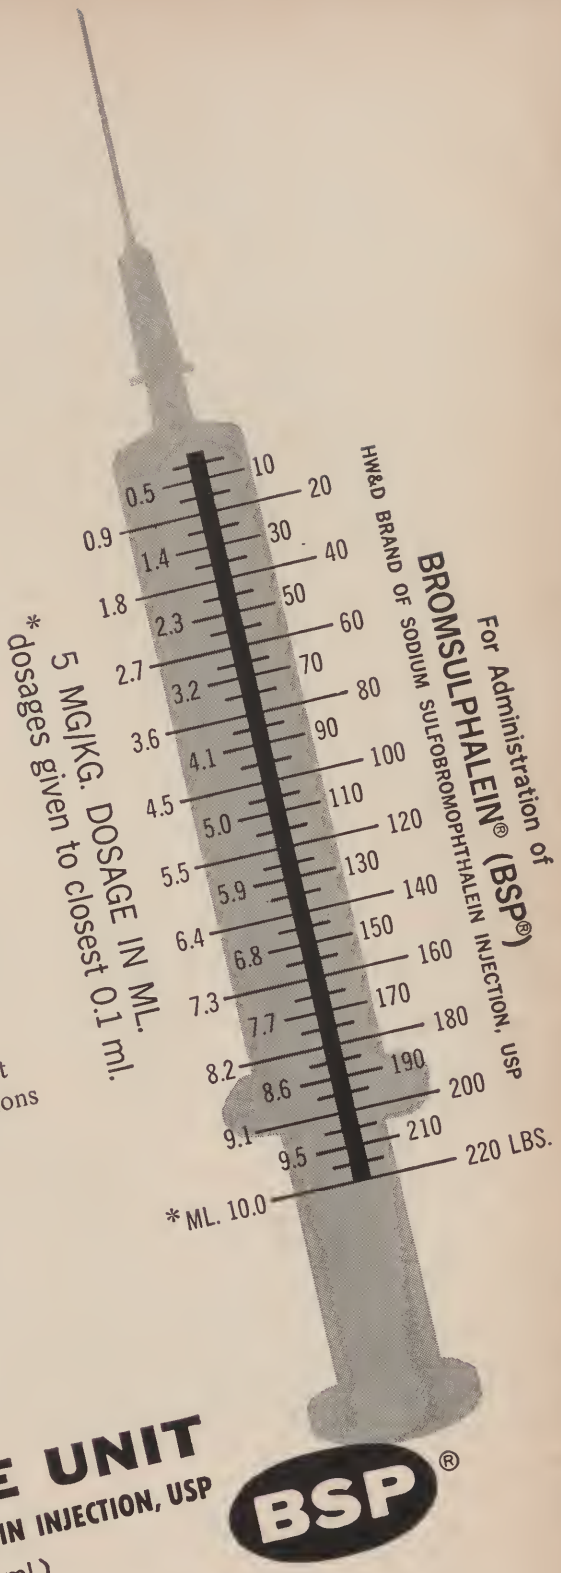
A RELIABLE, PROVEN PRODUCT . . .

The BSP test, introduced in 1925, remains one of the most sensitive laboratory procedures available for determining hepatic function.



A STERILE, CONVENIENT PUT-UP . . .

Each BSP Disposable Unit contains: a sterile, glass, disposable syringe with the 5 mg./kg. BSP dosage schedule imprinted on the barrel, a sterile needle, alcohol swab and a 7.5 ml. or 10 ml. size ampule of Bromsulphalein.

The BSP unit is designed for maximum patient protection. The precalibrated syringe makes weight calculations unnecessary and provides for proper dosage regardless of patient-weight.

ECONOMICALLY PACKAGED . . .

Prepared for economic unit dispensing, this completely disposable put-up affords a savings in time and labor—the most costly commodities.

When the stagnant sinus must be drained...

Transillumination of the sinuses – diffuse shadow on right side of face indicates unilateral maxillary sinusitis.

In the common cold, Neo-Synephrine is unsurpassed for reducing nasal turgescence. It stops the stuffy feeling at once. It opens sinus ostia to re-establish drainage and lessen the chance of sinusitis. With Neo-Synephrine, in the concentrations most commonly used, decongestion lasts long enough for extended breathing comfort, without endangering delicate respiratory tissue. Systemic side effects are virtually unknown. There is little rebound tendency.

Neo-Synephrine® HCl

Brand of phenylephrine hydrochloride

is available in a variety of forms, for all ages:

- 1/8% solution for infants
- 1/4% solution for children and adults
- 1/4% pediatric nasal spray for children
- 1/2% solution for adults
- 1/2% nasal spray for adults
- 1/2% jelly for children and adults
- 1% solution for adults (resistant cases)

Also NTZ® Solution or Spray

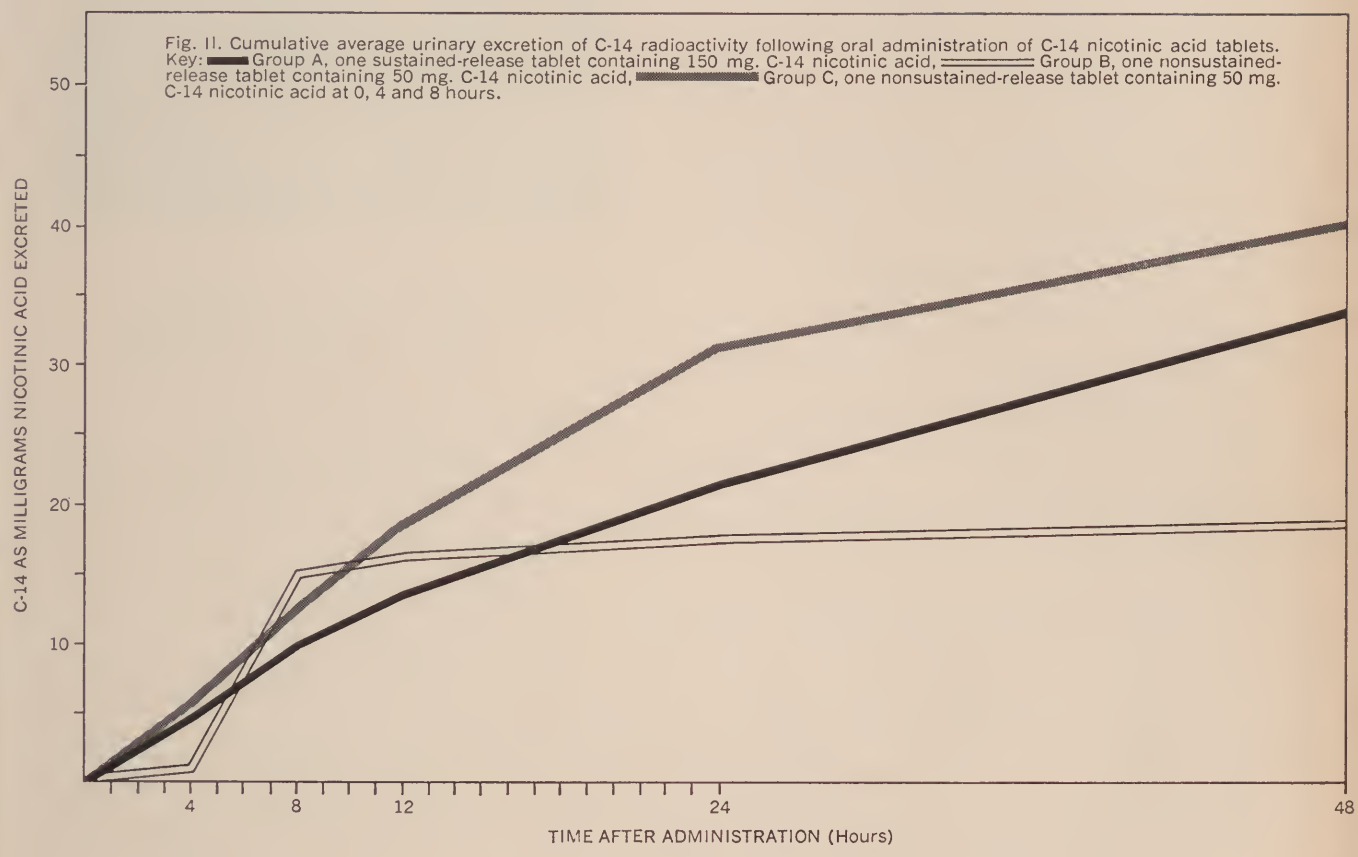
Sustained circulatory, respiratory and cerebral stimulation for the

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

aged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

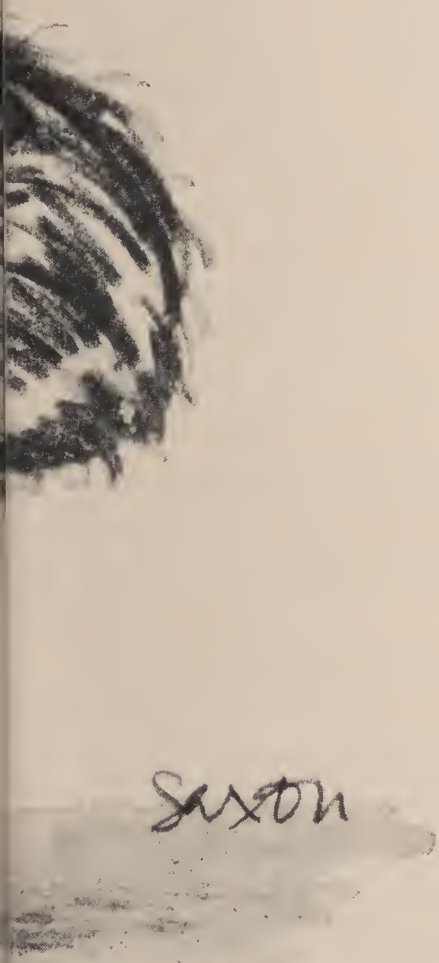
Now, now, Mrs. Forsythe, we've never lost a cold patient yet.

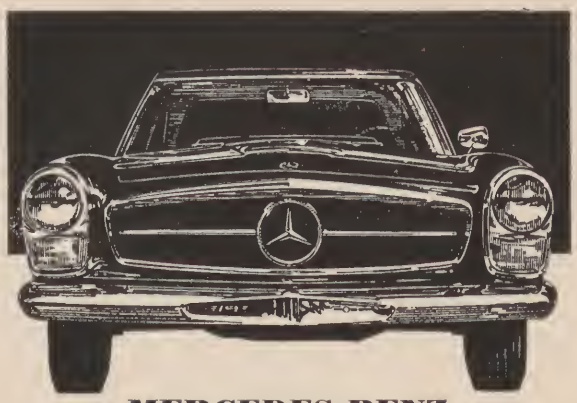
When she's experiencing acute discomfort from cold symptoms, it's small wonder the patient becomes distressed about her condition.

She will breathe easier when you prescribe Novahistine LP.

Novahistine LP is a long-acting decongestant that helps restore normal mucus secretion and ciliary activity—physiologic mechanisms which prevent infection of the respiratory tract. A dose of two tablets taken in the morning and repeated in the evening will usually keep air passages clear for 24 hours.



Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution patients who operate machinery or motor vehicles that drowsiness may result.



Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

EXECUTIVE SECRETARY'S NEWSLETTER

February, 1967

ANNUAL MEETING RESOLUTIONS

The following resolutions have been introduced for consideration at the Annual Meeting, Friday, April 21, 1967:

1A/67 - by Prince George's County Medical Society. "Condemning Attempts by Insurance Carriers to Determine Qualifications of Physicians; and Requesting that such Carriers Amend Their Regulations to Prevent This"

2A/67 - by M. B. Levin, M.D., Baltimore City "Providing for Changes in the Medical Practice Act"

3A/67 - by George Vash, M.D., Baltimore City "Closing of All Well-Baby Clinics and Transfer of Patients to Private Physicians"

All will be discussed at the Reference Committee Meeting scheduled for:

Wednesday, March 29, at 8:00 p.m.

at the Faculty Building. All members and interested parties are welcome to present their views.

Copies of the resolutions are available to Faculty members through the Faculty office.

GENERAL MEETING RE MILLIS REPORT ON INSURANCE FORMS

A General Meeting to which all interested persons are invited has been scheduled by the Liaison Committee. Its purpose is to discuss all insurance and other forms utilized by physicians.

The Millis Report deals with the new curriculum proposed for education of physicians and, more specifically, to increase the supply of Personal Physicians.

The meeting is to be held in the Faculty Building on Thursday, March 23, at 8:00 p.m.

GOOD SAMARITAN PLANNING OFFICE

Physicians interested in contacting those responsible for the planning of the Good Samaritan Hospital may make contact with them at:

Good Samaritan Planning Office,
1650 East Belvedere Avenue, Apt. T3
Baltimore, Maryland 21212
Telephone: 323-1800 or 323-1801

All communications should be addressed, Care of the Medical Director.

NEWS NOTES

David B. McIntyre, M.D., and James Castellano, M.D., have moved their offices to 3350 Wilkins Avenue where they practice Obstetrics and Gynecology.

Harris Lovice, M.D., has opened his office for the practice of Internal Medicine and Endocrinology at the Pikesville Medical Center.

Leonard J. Gallant, M D., is scheduled to present a seminar on the Psychotherapy of the Socially Disturbed at Guys Hospital, London, England, in April.

Jonas R. Rappeport, M.D., has been named to the Board of the Patuxent Institute for the Criminally Insane.

New Medical Staff appointments include, E. Paul Coffay, Jr., M.D., as President of St. Joseph Hospital; George H. Greenstein, M.D., at Sinai Hospital; and Irvin H. Cohen, M.D., as Director of Psychiatric Education.

Donald A. Wolfel, M.D., Baltimore, has been made a Fellow of the American College of Radiology.

Norinyl® tablets
(norethindrone 2 mg. c mestranol 0.1 mg.)

for multiple contraceptive action that has produced a record of unexcelled effectiveness

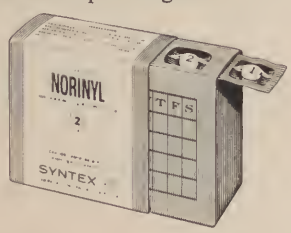
inhibition of ovulation by means of 2 time-proved hormonal agents

production of a cervical mucus hostile to sperm motility and vitality

creation of an endometrium unreceptive to egg implantation

no unplanned pregnancies

Norinyl provides multiple action for maximum assurance of success. It does not depend on ovulation inhibition alone for contraceptive effectiveness. The mechanism of action of combined hormonal therapy results in ovulation inhibition reinforced by other protective mechanisms, including a hostile cervical mucus[1-13] and an acceleration of endometrial changes.[1-3,7-16] With Norinyl, no unplanned pregnancies have been reported to date when used as directed.



plus important supportive benefits that help her through those critical early months of oral contraception

low incidence of side effects

Low incidence of BTB and spotting, nausea and amenorrhea tends to minimize side effect problems and increases patient cooperation.

no confusion about dosage

An unbreakable "confusionproof" package makes it easy to adhere to prescribed dosage schedule: individually sealed tablets numbered from 1 through 20 *plus* monthly calendar record enables patient to double-check dosage intake by day and corresponding tablet number.

Contraindications: Thrombophlebitis or pulmonary embolism (current or past). Existing evidence does not support a causal relationship between use of Norinyl and development of thromboembolism. While a study which was conducted does not resolve definitively the possible etiologic relationship between progestational agents and intravascular clotting, it tends to confirm the findings of the Ad Hoc Advisory Committee appointed by the Food and Drug Administration to review this possibility. Cardiac, renal or hepatic dysfunction. Carcinoma of the breast or genital tract. Patients with a history of psychic depression should be carefully studied and the drug discontinued if depression recurs to marked degree. Patients with a history of cerebral vascular accident.

Warning: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn.

Precautions: By May 1963, experience with norethindrone 2 mg.—mestranol 0.1 mg. had extended over 24 months. Through miscalculation, omission or error in taking the recommended dosage of Norinyl, pregnancy may result. If regular menses fail to appear and treatment schedule has not been adhered to, or if patient misses two menstrual periods, possibility of pregnancy should be resolved before resuming Norinyl. If pregnancy is established, Norinyl should be discontinued during period of gestation since virilization of the female fetus has been reported with oral use of progestational agents or estrogen. When lactation is desired, withhold Norinyl until nursing needs are established. Existing uterine fibroids may increase in size. In metabolic or endocrine disorders, careful clinical preevaluation is indicated. A few patients without evidence of hyperthyroidism had elevated serum protein-bound iodine levels, which in the light of present knowledge, does not necessarily imply hyperthyroidism. Protein-bound iodine increased following estrogen administration. Bromsulphalein retention has occurred in up to 25% of patients without evidence of hepatic dysfunction. Studies from 24-hour urine collections have shown an increase in aldosterone and 17-ketosteroids and decrease in 17-hydroxycorticoid levels. Thus, Norinyl should be discontinued prior to and during thyroid, liver or adrenal function tests. Because progestational agents may cause fluid retention, conditions such as epilepsy, migraine and asthma require careful observation. Thus far no deleterious effect on pituitary, ovarian or adrenal function has been noted; however, long-range possible effect on these and other organs must await more prolonged observation. Norinyl should be used with caution in patients with bone, renal or any disease involving calcium or phosphorus metabolism.

Side Effects: Intermenstrual bleeding; amenorrhea; symptoms resembling early pregnancy, such as nausea, breast engorgement or enlargement, chloasma and minor degree of fluid retention (if these should occur and patient has not strictly adhered to medication plan, she should be tested for pregnancy); weight gain; subjective complaints such as headache, dizziness, nervousness, irritability; in a few patients libido was increased. In a total of 3,090 patients, 2.2% discontinued medication because of nausea.

NOTE: See sections on contraindications and precautions for possible side effects on other organ systems.

Dosage and Administration: One Norinyl tablet orally for 20 days, commencing on day 5 through and including day 24 of the menstrual cycle. (Day 1 is the first day of menstrual bleeding.)

Availability: Dispensers of 20 and 60 tablets; bottles of 100.

Your MEDICAL FACULTY at Work

JOHN SARGEANT EXECUTIVE SECRETARY

EXECUTIVE COMMITTEE, JANUARY 5

1. Acting upon a request from the Student American Medical Association that the Faculty become a "sustaining" member of SAMA at an annual cost of $100, the Committee voted in favor of membership.

2. The requests of the chairmen of two Faculty Committees for funds to attend February meetings in Chicago were discussed at length. One, a request for transportation expenses only, was granted on the dual basis that the meeting would provide indoctrination for a new chairman and the program, designed to explore activities at state and county levels, would assist him in the guidance of Committee activities during the coming year; the other, a request for general expenses, was denied on the grounds that the chairman had attended previous meetings on the same subject and the benefits to him and to his committee of his attendance at another did not appear to warrant the expenditure of Faculty funds.

3. The installation, for security reasons, of an electric door-opener on the front, inside door of the Faculty building was approved. The estimated cost is $225.

4. The Committee selected Charles J. Savarese, MD, chairman of the Faculty's Medical Emergency Disaster Committee, to attend an American Medical Association Meeting on Emergency Medical Services in Chicago, on April 6 and 7, at AMA expense.

5. Karl F. Mech, MD, reported that the last surviving beneficiary of the Walter R. Steiner Trust Fund had died and that the corpus now comes to the Faculty. On June 30, 1966, the market value of the fund, the income from which is to be used for books and journals, was approximately $381,000.

6. It was determined that Emeritus membership in the Faculty for Henry G. Hadley, MD, could not be granted at his request since the Bylaws require that such membership be considered only on the recommendation of a Component Society. Although Dr. Hadley qualifies for Emeritus membership in other respects, he is not at present a member of any Component Society; having retired, he is not eligible for membership in Prince George's County, where he resides, and the Anne Arundel County Medical Society, of which he was formerly a member, does not feel it can recommend him because he is no longer practicing or residing in that county.

7. The Committee denied a request from the publishers of *Encyclopaedia Britannica* to use the Faculty letterhead to solicit Faculty members by mail in return for ten dollars per member-sale.

8. The Committee approved of the President's recommending the following pediatricians to the State Board of Health and Mental Hygiene for appointment to the Advisory Council on Mental Hygiene: Annie M. Bestebreurtje, MD, of Baltimore City; John M. Krager, MD, and Ramsay B. Thomas, MD, both of Baltimore County. Recommendation to the same Board of Donald M. Roop, MD, as Health Officer for Baltimore County, was

also approved.

9. A letter to Governor-elect Agnew was authorized in connection with the reappointment to the State Board of Health and Mental Hygiene of Aaron Dietz, MD; Irene M. Duffy, RN; and Cornelius P. Kruse, PhD.

10. The Committee approved of the listing of the following three names for consideration by the Governor in the appointment of a physician trained in roentgenology, and in practice for five years, as a member of the Medical Board for Occupational Diseases for a six-year term: Whitmer B. Firor, MD (reappointment); John M. Dennis, MD; and Byron G. Brogdon, MD. Others presently serving on this board are J. Sheldon Eastland, MD, and James Frenkil, MD.

11. Having examined information obtained relevant to an anonymous accusation that compulsory assessment of medical staff members exists at St. Joseph Hospital and Maryland General Hospital, the Committee concluded that there seemed to be no compulsion with regard to assessments, but decided to advise the Judicial Council of the AMA of this opinion and to ask for comments on the specific situations involved.

12. Based on the information available in the case of a complaint from M. B. Levin, MD, against the Greater Baltimore Medical Center, the Committee agreed that the patient had the right of free choice as to his institution and his physician and that Dr. Levin should be advised of its conclusion that the actions of GBMC were in order.

13. It was reported that the Maryland Hospital Commission had given its assurance that in making its determinations on applications for loan funds, the Commission would refer to all available, appropriate sources of information.

14. The Committee agreed that correspondence involving complaints about the medical care program should be referred to the Faculty's representatives on the Council on Medical Care for their information and action.

15. The Committee concurred in action taken by the Executive Secretary in registering an objection with the State Department of Health to a regulation that would require examinations at proposed Group Day Care Centers by "qualified pediatricians" rather than by "physicians." It was agreed that designation by specialty indicated discrimination against other physicians.

16. The Committee agreed to obtain, in writing, the policies to be established in connection with staff privileges at the new Good Samaritan Hospital.

17. A "correspondence blitz" on US Senators and Congressmen with respect to "direct billing" for medicare patients (Public Law 89-97, Title 19) was reported to have been recommended by the Lousiana State Medical Society and was discussed at length. The Committee questioned the extent of knowledge among physicians of the direct billing regulations and the value of the suggested approach, but agreed that members individually could be urged to protest the regulations through any available means.

COUNCIL, JANUARY 19

1. The Council endorsed the proposal of a request for a grant from the US Public Health Service for a Model Ambulatory Community Health Service for Chronic Respiratory Disease at the Maryland General Hospital, as presented and explained by William S. Spicer, Jr., MD, who is in charge of the project.

2. Speaking for John Whitridge, Jr., MD, chairman of the Subcommittee on Maternal Welfare, John H. Hirschfeld, MD, chairman of the parent Committee on Postgraduate Education, Preventive Medicine and Public Health, presented the proposal that the Faculty endorse a policy on family planning similar to that of the AMA. By vote of the Council, the Medical and Chirurgical Faculty went on record as "recognizing the provision of family planning advice and services as an integral part of the practice of medicine" and as urging "the physicians of Maryland to provide such advice and services as are consistent with their own personal and moral convictions and those of their patients."

3. As recommended by Milton B. Kress, MD, chairman of the Subcommittee on Chronic Respiratory Diseases, the Council voted to direct the Legislative Committee and the Legislative Representative of the Faculty to remain alert for an opportunity to propose an amendment to the law regulating the Air Pollution Control Council to

the effect that a "physician in active practice, skilled in the treatment of pulmonary disease" be included as a member of the Council.

4. On the recommendation of the Committee on Postgraduate Education, Preventive Medicine and Public Health, to which the proposal had been referred, the Council voted to take no action in connection with a request for a grant for study of the need in Maryland of a Regional Medical Center for Heart Disease, Cancer and Stroke under Public Law 89-239. It was the consensus that the proposed request did not need the Faculty's approval or disapproval.

5. Approval was granted for use of the MEDIC network by those responsible for implementation of the Educational program related to PL 89-239, with the understanding that appropriate charges would be made.

6. Having heard and discussed a proposal for a statewide measles immunization program to be financed by funds from the Faculty's Educational Fund, the Council voted for endorsement of such a program as a Component Society endeavor with the understanding that the Educational Fund may be used for publicity and educational purposes, but that the program would be implemented as each component saw fit.

7. On the recommendation of the Executive Committee, the Council unanimously approved the suggestion that payments under Maryland's Medical Assistance program be handled by Maryland Medical Service, Inc., because of its wide experience in this field and because of the savings that could be effected.

8. Ratification of legal defense for six physicians was approved.

9. Settlement of a case against a physician was reported.

10. As recommended by the Program and Arrangements Committee, April 1, 2 and 3 were approved as the dates for the 1970 Annual Meeting of the Faculty.

11. Advised that an additional sum of $1,500 had been received from M. McKendree Boyer, MD, for addition to the George M. Boyer, MD, Lecture Fund, the Council voted an expression of appreciation.

12. The recommendation of the Executive Committee that use of the Faculty building on a no-charge basis be restricted to Specialty groups 90% of whose members are Faculty members was adopted by a vote of nine to seven, it being understood that any group which does not fulfill this requirement may continue to use the facilities by paying the expenses involved. Specialty groups will be requested annually to check the conformity of their membership with the 90% requirement.

13. The Council, on recommendation of the Executive Committee, adopted the following policy for the Faculty: "Employment policies are based on the person's ability to perform the task involved and are not subject to discrimination upon the basis of race, color, religion, national origin or ancestry."

14. The Council approved the 1967 budget as presented by the Treasurer and as recommended by the Executive Committee.

15. Seven independent paragraphs in four articles of the Med-Chi Insurance Trust were amended as recommended by legal counsel and the Trustees.

16. The Council voted to nominate the following for three-year terms on the Blue Cross Board of Directors: William D. Lynn, MD, Baltimore City (reappointment); J. Tyler Baker, MD, Easton; and Richard A. Young, MD, Hagerstown.

17. Three physicians were nominated for three-year terms on the Blue Shield Board of Directors (F. Ford Loker, MD, a reappointment; J. Sheldon Eastland, MD, also a reappointment; and C. Parke Scarborough, MD—all of Baltimore City) and three (all reappointments and all of Baltimore City) for one-year terms as members of the Blue Shield Medical Relations Committee: Robert F. Healy, MD, surgeon; W. Bradley King, Jr., MD, pathologist; and Edward H. Richardson, MD, gynecologist.

18. The Council voted to nominate the following to serve for one year on the Blue Shield Reference and Appeals Committee: A. Talbot Brice, MD, general practice; Webster H. Brown, MD, radiology; W. Bowdoin Davis, Sr., MD, plastic surgery; Albert H. Dudley, Jr., MD, obstetrics and gynecology; William B. Holden, MD, psychiatry; J. T. H. Johnson, MD, orthopedics; Nicholas Mallis, MD, urology; B. Martin Middleton, MD, surgery; Granville H. Richards, Jr., MD, gen-

Only JOBST supports are custom made from precise measurements of the individual extremity.

When the patient's extremity is carefully measured with the unique JOBST Measuring Tape, it marks the second step toward providing him with a custom-made VENOUS PRESSURE GRADIENT support. The first step begins with a prescription. Your prescription. With your diagnosis and indication for the correct counter pressures to be engineered into the support. JOBST supports are widely used in treatment of stasis dermatitis, postmastectomy lymphedema, postural hypotension, post-fracture, post-operative and injury edema. Trained experts will measure and fit your patients for you at one of our convenient Service Centers.

for the

ANNUAL MEETING OF THE MEDICAL AND CHIRURGICAL FACULTY

APRIL 19, 20, 21, 1967

A block of rooms has been set aside at the SHERATON-BELVEDERE HOTEL, Baltimore, for those attending this meeting. Because of many activities in the city, rooms will be at a premium.

The rates will be from $17.00 to $19.00 for a twin bedded room and bath for two persons; single occupancy will be $13.00 to $15.00.

FOR YOUR HOTEL RESERVATION DETACH AND MAIL THIS SLIP DIRECTLY TO:

Mrs. Jacqueline Amati
SHERATON-BELVEDERE HOTEL
Charles & Chase Sts., Balto., Md. 21202

Address _____ **City** _____ **State** _____

Please reserve ..... **rooms Approximate rate** .....**No. of persons**.....

Date of arrival.....**Date of departure** .....

Attending Annual Meeting of the Medical and Chirurgical Faculty.
All requests subject to confirmation.

169th ANNUAL MEETING OF THE

WEDNESDAY-FRIDAY APRIL 19-21

THE ALCAZAR BALTIMORE

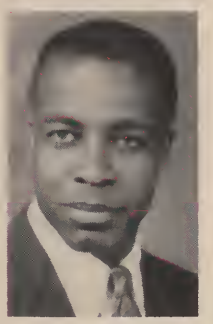
Three days of scientific sessions at the annual meeting of the Medical and Chirurgical Faculty will provide an excellent opportunity for postgraduate education, according to an announcement by **James B. Brooks, MD,** chairman of the Committee on Program and Arrangements. In addition to speakers named in earlier issues of THE JOURNAL, the following outstanding men of medicine will present papers during the three-day period from April 19 through April 21:

Dr. Lee

Philip R. Lee, MD, who will speak on April 20, is Assistant Secretary for Health and Scientific Affairs, US Department of Health, Education, and Welfare. The title of his talk will be **"Medical Care: The Next Decade in the Public-Private Partnership."** Dr. Lee was born in San Francisco and received his AB and MD degrees from Stanford University. Following internship at Massachusetts Memorial Hospital in Boston, he became assistant resident physician at Stanford University Hospital. In 1949, he volunteered for active duty in the US Navy, and served for two years as a lieutenant in the Medical Corps. Most of this time was spent on active sea duty and included one year in the Korean theater.

After military service, Dr. Lee served first as a Fellow at Bellevue Medical Center, then as a Fellow at the Mayo Clinic in Rochester. While in Rochester he earned an MS degree at the University of Minnesota Graduate School. There followed a year of teaching and research at Bellevue Medical Center, after which Dr. Lee returned to his native California as a staff member of the Palo Alto Medical Clinic and assistant clinical professor at the Stanford University School of Medicine. From 1963 to 1965, he was director of Health Services in the Agency for International Development, Office of Technical Cooperation and Research. In May of 1965 he was given AID's Superior Honor Award and cited for establishing "new policies, priorities, and programs in the fields of health, nutrition, and population."

After serving as Deputy Assistant Secretary of Health, Education, and Welfare for a few months in 1965, he was appointed to his present position as Assistant Secretary for Health and Scientific Affairs. Dr. Lee is the author of numerous scientific articles and has contributed to many textbooks.



Dr. Palmer

Richard E. Palmer, MD, associate clinical professor of pathology at the George Washington University School of Medicine, will give the George M. Boyer, MD, Lecture this year. After receiving his MD degree from the George Washington University, Dr. Palmer served an internship and residency at the George Washington University Hospital, then served for a year as a teaching Fellow in pathology at the School of Medicine. Since 1949 he has been a pathologist at the Alexandria Hospital in Virginia and pathologist to the Office of the Chief Medical Examiner of Virginia.

Dr. Palmer has served as secretary and president of the medical staff of the Alexandria Hospital, president of the Alexandria Medical Society, president of the American Society of Clinical Pathologists, and president of the Medical Society of Virginia. Since 1962 he has been a trustee of the Private Practitioners of Pathology Foundation and was elected president for 1966-1967. Since 1965 he has been a commissioner representing the AMA on the Joint Commission on Accreditation of Hospitals. Dr. Palmer has had many articles published in national and state medical journals.

MEDICAL AND CHIRURGICAL FACULTY

Dr. Henry

Walter Lester Henry, MD, will present a paper on **"Differential Diagnosis of Hypercalcemia."** Dr. Henry is head of the Department of Medicine at Howard University College of Medicine and chief of medicine at Freedmen's Hospital in Washington, DC. Dr. Henry received his AB from Temple University and his MD from Howard University in 1941, graduating first in his class. After internship and residencies at Freedmen's Hospital in Washington, he attended the Graduate School of Medicine, University of Pennsylvania. From 1951 to 1953 he was a Fellow in Endocrinology at the Michael Reese Hospital in Chicago.

Dr. Henry is consultant in internal medicine at the Mt. Alto Veterans Administration Hospital and is visiting physician at the DC General Hospital. His membership in scientific and medical societies includes the American College of Physicians, the American Medical Association, the DC Medical Society, the National Medical Association, the Medico-Chirurgical Society of DC, and the Association of Federation for Clinical Research. Dr. Henry is the author of many scientific articles and in 1952 was certified by the American Board of Internal Medicine.

Dr. Gombos

Ervin A. Gombos, MD, and **Joseph H. Holmes, MD,** will participate in a kidney symposium moderated by W. Gordon Walker, MD, associate professor of Medicine at The Johns Hopkins University School of Medicine.

Dr. Gombos will speak on **"Chronic Hemodialysis, Clinical Program and Technical Solutions."** Dr. Gombos received an AB degree from Zrinyi Gymnasium in Budapest, and an MD degree at the University of Zagreb School of Medicine in Yugoslavia. He served a rotating internship and assistant residency at the University Hospital in Zagreb, followed by a rotating internship at French Hospital in New York and assistant residency at Memorial Center, also in New York. Dr. Gombos was a Fellow in medicine and Visiting Research Fellow at Memorial Center and Sloan-Kettering Institute and, successively, a Research Fellow and a Postdoctorate Research Fellow in the Department of Medicine, New York University School of Medicine. He is a member of the American Federation for Clinical Research, the American Society for Artificial Internal Organs, the New York Academy of Sciences, the American Physiological Society, the American Medical Association, the European Dialysis and Transplant Association, and other professional societies.

Dr. Gombos has served on the Scientific Advisory Council of both the National Kidney Disease Foundation and the Washington Heart Association. He is associate professor of medicine at the George Washington University School of Medicine, and chief of the Nephrology Section and director of the Hemodialysis Center at the Veterans Administration Hospital in Washington. He has contributed numerous articles to both American and foreign publications.

Dr. Holmes

Joseph H. Holmes, MD, the second participant in the kidney symposium, will speak on **"The Role of the Internist or Family Physician in Renal Transplantation."** He is professor of medicine, head of the Division of Renal Disease and director of the School of Medical Technology at the University of Colorado Medical Center in Denver. Dr. Holmes was graduated from Amherst College and received his MD degree at Western Reserve University and a doctor of medical science degree at Columbia University. After a rotating internship at Emory University Hospital and a residency in internal medicine at the University Hospital in Baltimore under Maurice C. Pincoffs, MD, from 1935 to 1937 he was a Fellow in medical sciences at Columbia University. His teaching appointments have included those of instructor and assistant professor of physiology at Columbia University.

Dr. Holmes served as a captain in the US Air Force assigned to the School of Aviation Medicine in San Antonio. He is a member of 14 scientific societies and is the author of over 135 articles, which have been published in scientific journals throughout the world. Dr. Holmes is certified by both the American Board of Internal Medicine and the American Board of Pathology.

The Vietnam conflict is presenting new problems in treating the wounds of war according to an article by three Army surgeons in the January 2 issue of the *Journal of the American Medical Association*. Major Norman M. Rich, Major Egon V. Johnson, and Lt. Col. Francis D. Dimond, Jr., of the US Army Medical Corps, report that new, high-velocity weapons are causing greater tissue damage than any previous small arms. On the other hand, improved medical care is cutting loss of life on the battlefield. Rapid helicopter evacuation, adequate blood replacement, antibiotics, established principles of war surgery, and modern operating room equipment have markedly lowered the proportion of Vietnam deaths due to wounds, as compared with those in earlier wars.

Weapons as new as the M-16 rifle and as old as the bow and arrow created the hundreds of kinds of wounds seen by the three surgeons at the Second Surgical Hospital in South Vietnam. Their report is on 1,196 patients treated at the hospital in the first five months of 1966, and particularly 521 missile wounds treated in that time. About half the missile wounds were from gunshots, and about half were due to fragments from grenades, mortars, artillery, mines, etc. There were 243 wounds from Punji sticks, an ancient, but dangerous weapon of the Viet Cong. A Punji is a sharpened stick with a fire-hardened, contaminated point. It is placed in the ground at an angle designed to puncture a soldier's foot.

"The Viet Cong have been ingenious in designing booby traps that utilize small-arms ammunition," the surgeons said. One wooden trap with a simple rubber-band mechanism and a small nail to act as detonator can fire a .50-caliber bullet or a shotgun shell when someone steps on the wire release. Another simple trap consists of two boards with three .45-caliber bullets imbedded in one of them. Approximately eight pounds of pressure will detonate these bullets when the boards are pushed together by an unsuspecting soldier's foot.

The American M-16 rifle is a very effective weapon, the surgeons point out. Its bullet's high velocity (3,250 feet per second) causes enormous tissue damage. The "tumbling effect" of the bullet after it strikes an object adds to this injury. The surgeons saw the effectiveness of the M-16 when some of these rifles fell into the hands of Communist forces and were fired at Americans, wounding several.

Only 1.3% of American soldiers wounded by missiles died after operations at the surgical hospital. This is a markedly lower figure than for similar operations in Korea and World War II. Wound infections after primary wound-closure operations totaled only 2%. Of those sustaining missile wounds, 58.1% were returned to duty after an average stay of 16 days in the hospital.

From an AMA news release, Jan. 1966.

From Washington

At a cost of nearly $1 billion, more than six million older persons got hospital care or medical benefits during the first six months of the medicare program.

Social Security Commissioner Robert M. Ball expressed satisfaction with the overall operations of the health insurance program for the elderly, but warned of bed shortages in the nation's capital, in various New England states, and in most rural areas as of January 1, when a new medicare benefit of nursing home care went into effect. He estimated that 50,000 to 60,000 beds would be needed for extended care in nursing homes.

The Commissioner's report on the first six months of medicare included the following items:

About 2.5 million elderly persons received free hospital care and 3.5 million benefited from medical services.

Since medicare began July 1, 1966, hospital occupancy has increased 5%, as expected. At the end of 1966, 30% of all hospital beds were occupied by those 65 or older.

About 6,700 hospitals are now participating

in medicare. About 250 hospitals were excluded because they did not meet minimum standards. 75 because of racial discrimination.

Payments to doctors and skilled medical personnel, such as radiologists, have taken too long.

Overcrowding of hospitals occurred only in "isolated" instances.

The $3.00 premium payments were maintained by almost all of 17.5 million persons who signed up for additional medical insurance.

From an AMA news release, Jan, 1966.

From Bethesda

Blood cells from a chronic myelogenous leukemia (CML) patient have been grown, for the first time, in long-term culture by Public Health Service scientists at the National Cancer Institute, National Institutes of Health, Bethesda, Md.

Both the abnormal chromosome characteristic of CML and a type of virus particle frequently found in other human leukemia cells were observed in the new culture, according to two reports published in the December issue of the *Journal of the National Cancer Institute.*

For purposes of study, the cultured cells were grouped in three categories according to size. With the assistance of Dr. J. H. Tjio of the National Institute of Arthritis and Metabolic Diseases, the National Cancer Institute investigators carried out microscopic studies of the culture that revealed the genetic abnormality, known as the Philadelphia chromosome, in 23% of all cells. These abnormal cells were comparable in all respects to those usually found in bone marrow samples taken from patients with chronic myelogenous leukemia.

Electron microscope examination of special cell preparations revealed the presence of herpes-like virus particles in a significant number of cells in the medium size range. The particles appeared to be structurally identical to those found by other investigators in a culture of acute myelogenous leukemia cells and in several cultures of cells from patients with Burkitt's lymphoma, a type of cancer that occurs frequently in African children.

In addition, a pattern of intracellular changes

similar to those observed previously in other leukemia cultures was seen in the virus-containing cells of the new CML line.

According to the investigators, presence of the virus particles in the cells does not provide sufficient evidence of a causative relationship to leukemia. However, observation of similar virus particles and cell changes in both chronic and acute myelogenous leukemia lines suggests that the two leukemias are related and may be caused by viruses of the same family group.

Scientists taking part in the studies were Linda S. Lucas, Robert A. Manaker, and Victor H. Zeve of the Viral Biology Branch, National Cancer Institute; Jacqueline J. K. Whang, Medicine Branch, National Cancer Institute; and J. H. Tjio, Laboratory of Experimental Pathology, National Institute of Arthritis and Metabolic Diseases.

Public Health Service and National Cancer Institute news release, Jan. 1966.

From New York

Medicine and the law moved toward closer understanding and liaison in dealing with narcotics addicts at a national conference in New York City in January. Jointly sponsored by the American Medical Association, the Medical Society of the State of New York and the County Medical Societies of New York City, the conference featured a two-day workshop on the control of narcotics and the management of narcotic-dependent persons. Following are some of the highlights of the group discussions:

There may be a tendency on the part of some medical practitioners to avoid prescribing narcotics to their patients when indicated, rather than to become involved in the complexities of control. In some instances overlapping federal, state and local laws and regulations, and problems of confidential relations between patient and physician, make difficult the exchange of information necessary to define the extent of narcotic drug dependence and the need for treatment and rehabilitation resources and activities. Important progress was made at the conference on the solution of such problems.

It was recommended that medical advisory and liaison committees be established at the

state and county levels that could serve as a source of guidance to the individual practitioner, to the law enforcement agencies and to the general public.

Better training of medical students, interns and residents in treatment of narcotic-dependent persons was recommended. Few physicians ever see such patients during their training.

The American Medical Association and the National Academy of Sciences-National Research Council have established guidelines relative to the appropriate and ethical use of narcotics and the treatment of drug-dependent persons. These guidelines are utilized by the Federal Bureau of Narcotics in establishing relevant Bureau policies. Collaboration between national law enforcement agencies and organized medicine is quite good, but national cooperation is several steps ahead of that in several states and in many localities, pointing up the need for establishment of state and local liaison mechanisms.

From an AMA news release, Jan, 1966.

DORSEY Season

A journal within a journal published quarterly in the interests of better medicine by Dorsey Laboratories, a division of The Wander Company, Lincoln, Nebraska. Address communications to Raymond C. Pogge, M.D., Director of Medicine.

this issue: the nose as a shock organ

the nose as a shock organ

by Charles J. Shagoury, M.D., Chelmsford, Massachusetts

"Is it a cold, hay fever, or has he been reprimanded by his boss?" Occasionally, you will ask yourself this question when confronted by a patient with abrupt onset of rhinorrhea, nasal obstruction, and sneezing. Usually the history will elucidate the problem, but examination of the nose will often provide valuable clues to the correct diagnosis.

The nose is a shock organ in a double sense. First, it is in the nose that the confrontation takes place with the surrounding atmosphere. For twenty-four hours a day, the nose must meet the varying challenges of the inspired air, containing perhaps noxious chemicals, dust, dirt, bacteria, viruses, fungi, and industrial pollutants of all kinds, and render it clean, virtually sterile, and fit for the sensitive alveoli of the lungs. Whatever the temperature or humidity of the atmosphere, the nose must transmit it to the lungs at approximately 98°F, and with a humidity of approximately 40%.[1]

Second, in particularly susceptible patients, the nose acts as a shock organ in a manner totally unrelated to its normal function. Persons with hay fever respond to ordinarily harmless materials by extreme nasal congestion, with marked rhinorrhea and violent spasms of sneezing. In some patients, exposure to threatening or disagreeable agents, or situations involving mental conflict may result in a reaction which is exclusively nasal, with swelling of the turbinates, and marked hypersecretion.[2]

Nasal symptoms usually result when the nose seeks to perform its function of getting rid of noxious and dangerous elements in the atmosphere, and prevent their admission to the trachea and lungs. Small particles are removed by the mucous coating which blankets the nasal passages. This mucous blanket contains a bacteriostatic agent, lysozyme, which destroys most air-borne bacteria.[3] The mucinous content renders the surface sticky, causing dusts and small particles to adhere. It has been postulated that this process is rendered more effective through adsorption because of a surface electrical charge on the nasal mucosa.[4] The cilia then sweep the particulate matter to the pharynx. The nose can prevent entrance into the lungs of particles as small as three microns in diameter, but smaller particles elude the nasal barrier. Most bacteria causing respiratory infections are one to three microns in diameter, but since they usually are inhaled in clumps, they are efficiently removed as a rule. Viruses, which are of the order of 1/1000 of this size, are less efficiently dealt with, unless they occur in very large aggregates.[5]

The nose will react in a more or less similar manner, whatever the nature of the offending agent, whether it be an irritant chemical, virus, pollen, or distasteful emotional situation. In acute coryza, the most characteristic sign is a profuse watery discharge. The volume of secretion may rise from practically nothing to nearly 60cc in twenty-four hours.[6] The mucous membrane is reddened and engorged, while the turbinates are markedly swollen. After the first day or two, the secretion becomes thicker, yellowish, and more difficult to expel. The surface cells are largely destroyed, contributing to the copious discharge, which now also contains numerous inflammatory cells which have migrated to the area. Gradually, over a period of a few days, or a week, the flood abates, the swelling and redness subside, and the nasal epithelium resumes a healthy appearance.

Repeated attacks of rhinitis, particularly if there is an underlying element of obstruction, may result in chronic rhinitis. The mucous membrane is constantly swollen and reddened. Sticky, mucopurulent secretions are a continuous feature, and the glandular elements are hypertrophied. Commonly, the mucosal surface takes on an irregular, rounded "mulberry" appearance, and nasal passages are occluded by the swollen turbinates and redundant mucosa.

While all of us are susceptible to colds, the victim of hay fever, or allergic rhinitis, displays a marked nasal reaction to materials in the air which leave his associates unaffected. In such a patient, the nasal mucosa has become an allergic "shock" organ. Contact with the nasal allergen causes local release of histamine, with vasodilatation, increased vascular permeability, and severe nasal congestion, similar to the "wheal" and "flare" reactions in the skin, when the epidermis is the allergic shock organ. While we eagerly await the coming of spring, the hay fever sufferer dreads the blooming season, whose invisible pollens are poisons to his sensitive nose. His neighbor's cat or dog may provoke paroxysms of uncontrollable sneezing. In some cases a specific allergen is not identified, but the triad of rhinorrhea, nasal obstruction, and sneezing is present.[7] The nose in these cases shows a pale, boggy, edematous mucosa, with a thin mucoid secretion. The mucous membrane shows extreme retractility to 1% cocaine or ephedrine. If the patient has medicated himself prior to examination, the nasal passages may appear abnormally patent, or show exaggerated congestion due to rebound reaction. The secretion may show a large number of eosinophils particularly after an attack of sneezing or rhinorrhea. Touching the mucosal surface, especially of the inferior turbinate, leaves an indentation, showing that the swelling is due to stasis and edema, rather than actual hyperplasia of the mucous membrane as in chronic hypertrophic rhinitis. Though the pale swollen mucosa is the hallmark of allergic rhinitis, as usually seen by the physician, exposure of allergic subjects to their known allergens results in a brief hyperemic phase, followed by pallor and edema.[8]

In the later stages of allergic rhinitis, the chronic edema of the mucous membrane results in the formation of polyps, clusters of grape-like masses hanging from the roof of the nose, with a pale glistening surface, contributing significantly to the sense of nasal obstruction and oppression.

A large group of patients show symptoms of nasal congestion when confronted by adverse life situations.[9] In these unfortunate persons, anxiety, frustration, and resentment are often accompanied by a runny nose and nasal obstruction. Lacrimation adds to the nasal stuffiness. This autonomic response, mediated by the parasympathetic nervous system, may be part of a general parasympathetic reaction, or may possibly represent in part, a symbolic effort to wash out and crowd out the offending situation.

Nasal congestion may also occur in some patients at times of sexual stimulation, and in women during menstruation and pregnancy, even to the point of epistaxis.[10] The relationship is obscure; castration results in atrophy of the nasal glands, and their action is inhibited by the hormones of the hypophysis and the thyroid.[11] The nose may be the shock organ in drug therapy. The nose may also bear the brunt of industrial stress, in those who work in a hot dry atmosphere, or those exposed to acid fumes, or irritating dusts. As the air in our cities is increasingly polluted by exhaust fumes, and industrial irritants, whole urban populations may suffer from chronic nasal and respiratory symptoms.

Of course, nasal reactions are not just infectious, or allergic, or emotional. Particularly in the chronic sufferers, there is an interdependence of all three. Death of a relative, or other psychic shock can pre-

(concluded on following page)

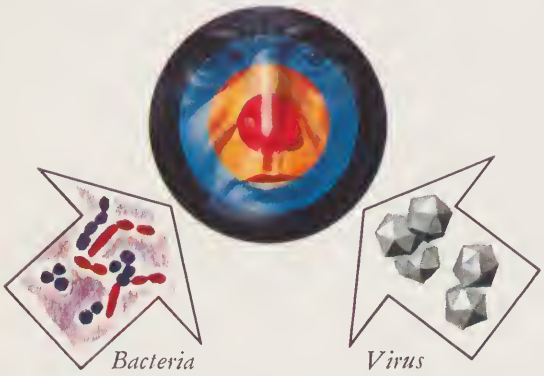
it's a comforting thing to know

For postnasal drip, clogged ears and stuffed and runny noses

Triaminic® timed-release tablets

Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.



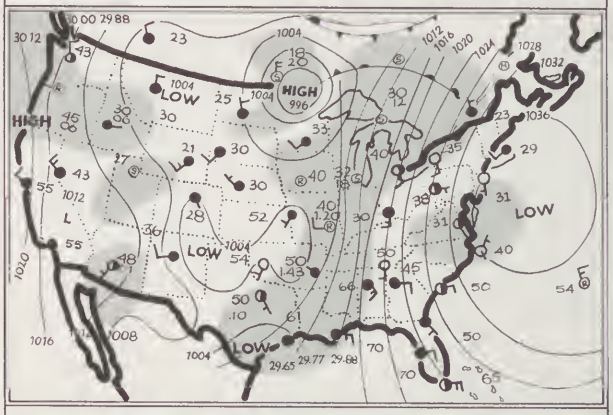
keep patients comfortable 'round the clock. 24-hour decongestion on just a single tablet dosed morning, mid-afternoon and at bedtime. Patients regain senses and can breathe, smell and taste again.

Triaminic. Isn't that a comforting thing to know?

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

(Advertisement)

cipitate an attack of rhinorrhea in hay fever sufferers.[12] Others develop attacks of vasomotor rhinitis following change in temperature, chilling, or exposure to the sun, or simply warm bedclothes.



The complex interplay of allergy and infection is largely unclear. Allergy to the viruses and bacteria which cause infection has been postulated, but is difficult to demonstrate. The swollen obstructed allergic nose is more susceptible to infection. At the same time, infection often precedes or precipitates an allergic attack. Exposure of a susceptible patient to an allergen can activate latent virus organisms leading to infection.[13] This "jolt" reaction represents a summation of an allergen and a virus leading to symptoms in the nose as a shock organ, which neither could have produced alone. In childhood, repeated attacks of bronchitis and colds may be inflammatory reactions to an allergen, or precipitated by exposure to an allergen. These children may later develop typical allergic rhinitis. On the other hand, children with typical allergic histories, eczema, asthma, and allergic familial backgrounds, may later develop typical infectious rhinopathies. Skin tests in such patients are usually positive.

Nasal reactions are part of the systemic response of the patient to an unwelcome stimulus. In cases of respiratory infection and exposure to atmospheric irritants, the reactions are useful, and to some extent desirable. They are usually self-limited, disappearing within a few days, or upon removal of the provoking agent. Here the distressing symptoms can be ameliorated with appropriate decongestant agents, or, in the case of severe or complicated respiratory infections, antibiotics may be given, with reasonable confidence of a cure. On the other hand, when nasal reactions are the peculiar response of an individual to an allergen, or to an undesirable situation, they serve no useful purpose. The nose here is a shock organ in a stressful situation, but can furnish no response of value. It merely causes the patient symptoms which add to his problems. In these cases, symptomatic treatment is of great benefit, but often the underlying faulty pattern of response cannot be altered. Such a patient may literally be considered to be paying his way in life "through the nose."

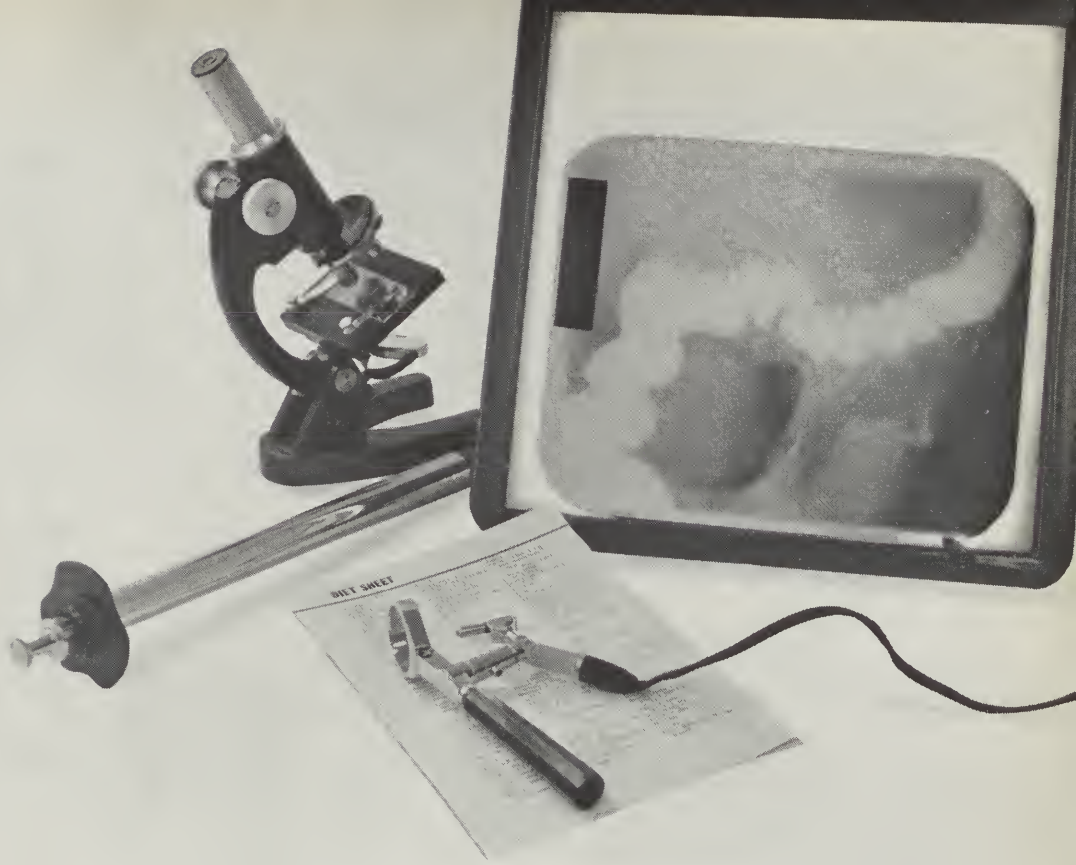
Weather Forecast Throughout the Nation

RAIN TURNING TO SNOW, INCREASING WINDS AND DROPPING TEMPERATURES FOLLOWED BY COUGH, CONGESTION AND PAIN



Tussagesic® provides up to 24-hour coverage of the tough cold with a single timed-release tablet dosed morning, midafternoon and at bedtime. Coughs are broken up, runny and stuffed noses are cleared and pain is relieved.

Each Tussagesic® timed-release tablet contains:

Triaminic®	50 mg.
(phenylpropanolamine hydrochloride 25 mg.; pheniramine maleate 12.5 mg.; pyrilamine maleate 12.5 mg.)	
Dextromethorphan hydrobromide	30 mg.
Terpin hydrate	180 mg.
Acetaminophen	325 mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: Patient should not drive a car or operate dangerous machinery if drowsiness occurs. Except under professional care, do not give to patients under 12 yrs. or those who have persistent cough, high fever, heart or thyroid disease, hypertension or diabetes or use for more than 10 days.

in digestive disorders:

B and C vitamins aid therapy. Nausea, vomiting, and severe diarrhea may seriously interfere with the digestion and absorption of nutrients. STRESSCAPS capsules, containing therapeutic quantities of vitamins B and C, may help meet the needs of these patients. In digestive disorders, as in many stress conditions, STRESSCAPS vitamins aid therapy.

Stresscaps®

Stress Formula Vitamins Lederle

FOR PROFESSIONAL RECOMMENDATION ONLY

Each capsule contains:

Vitamin B_1 (as Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York

when he just can't sleep

Tuinal®

Sodium Amobarbital and Sodium Secobarbital

(One-Half Sodium Amobarbital and One-Half Sodium Secobarbital)

Tuinal helps wakeful patients fall asleep fast, stay asleep all night.

Indications: Tuinal, comprised of equal parts of Seconal® Sodium (sodium secobarbital, Lilly) and Amytal® Sodium (sodium amobarbital, Lilly), is indicated for prompt and moderately long-acting hypnosis.

Contraindications: Barbiturates should not be administered to anyone with a history of porphyria, nor should they be given in the presence of uncontrolled pain, because excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Dosage: 1½ to 3 grains at bedtime.

Supplied: ¾, 1½, and 3-grain Pulvules®.

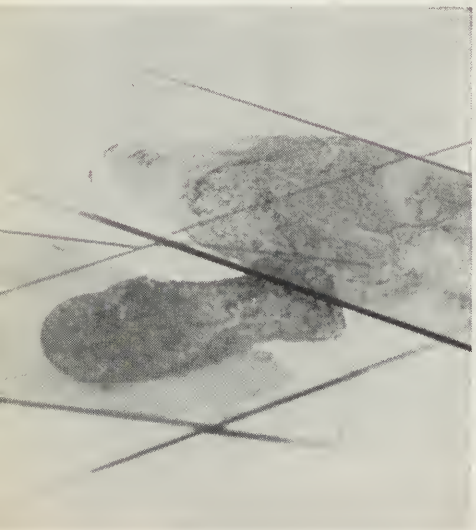
New
low-cost tetracycline/antifungal therapy

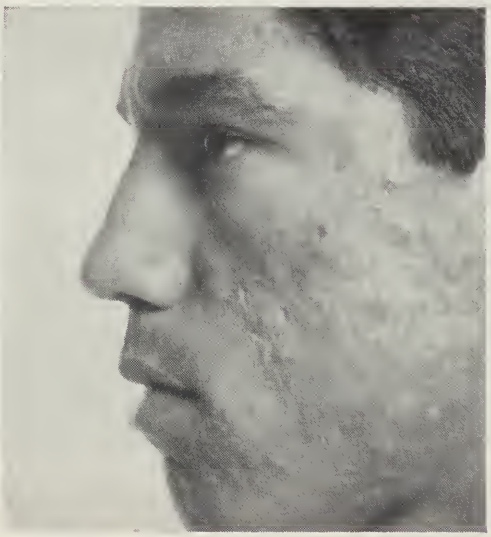
for broad-spectrum activity
plus specific antifungal prophylaxis
at significant patient savings

Whenever tetracycline is indicated in these candidates for Candida:

1. diabetic patients



2. nonpregnant women with a history of recent or recurrent monilial vaginitis



3. elderly or debilitated patients

4. patients with a past history of moniliasis

5. patients on long-term tetracycline or corticosteroid therapy

BRISTOL THERAPEUTIC SUMMARY: For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower dosage should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule *q.i.d.* Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals. *How Supply:* Capsules, bottles of 16. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin.

BRISTOL LABORATORIES
Division of Bristol-Myers Company
Syracuse, New York

Tetrex-F®

Each capsule contains tetracycline phosphate complex equivalent to tetracycline hydrochloride 250 mg. and nystatin 250,000 units.

Tetrex-F is priced lower
than most
tetracycline-antifungal products

Mike expects a penicillin injection. He's about to be pleasantly surprised.

His physician is going to prescribe an oral penicillin —PEN•VEE® K (potassium phenoxymethyl penicillin). It's usually so rapidly and completely absorbed that therapeutic serum levels are produced in 15 to 30 minutes. Higher serum levels generally last longer than with oral penicillin G.

Indications: Infections due to pathogens susceptible to oral penicillin G. Prophylaxis of rheumatic fever in patients with previous history of the disease.

Precautions: Skin rash, symptoms resembling those of serum sickness, or other manifestations of penicillin-allergy may occur. Measures for treating anaphylaxis should be readily available: epinephrine, oxygen and pressor drugs for relief of immediate allergic reactions; antihistamines and corticosteroids for delayed effects. Penicillin may delay or prevent the appearance of primary syphilitic lesions. Patients with gonorrhea who are suspected of concurrent syphilitic infections should be tested serologically for at least 3 months. Where lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. As with other antibiotics overgrowth of nonsusceptible organisms may occur; if so, discontinue and take appropriate measures. Treat β-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent development of rheumatic fever or glomerulonephritis.

Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.

Composition: Tablets—125 mg. (200,000 units) and 250 mg., (400,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc. **Wyeth Laboratories Philadelphia, Pa.**

PROBLEMS OF PRACTICE

W. EDWARD GALLIE, MD

Your kind words of introduction remind me of the feeling I have always had in Baltimore—that, far from being a stranger in a strange land, I am among friends. Not only have I grown up with many of you in our art and science, but I am ever conscious that in many surprising ways your traditions are our traditions. Indeed, except for some considerations of geography and of political institutions, we are one people.

You have probably noticed that in the past few weeks a great and historical political event has occurred in Canada. Newfoundland has at last entered Confederation and has become our tenth province. This must recall to you that the founder of the first settlement on the south-east corner of Newfoundland, the peninsula of Avilon, was the same man who brought the first English settlers to Maryland and gave his name to this city. George Calvert, Lord Baltimore, received charters for both these enterprises from King Charles the First, early in the 17th century, over three hundred years ago.

But of far greater interest to me is the recollection of the contacts I had with some of the men who have made Maryland and American Medicine great. I met Sir William Osler only once, on the occasion when he delivered his famous address to the medical students in Toronto on the "Master Word in Medicine." But my contacts with him go far beyond that, for it happens that I was born in Barrie, Ontario, and received my education in the Barrie Grammar School where Osler had gone to school thirty years before. I actually knew several men who were schoolboys with him at that time and took part in the pranks that have been so well described by Harvey Cushing. The Osler tradition there is very strong.

Sixty years ago to-night Professor Osler was the guest speaker of the Medical and Chirurgical Faculty of Maryland. His subject was "License to Practice." In his address he attacked the existing system of medical education and the absence of safeguards for the protection of the public from quacks, charlatans and shockingly untrained doctors. He asked "Is it to be wondered, considering this shocking laxity, that there is a widespread distrust in the public of professional education?"

Reading this address of sixty years ago has set me thinking of what has happened in medical practice in the intervening years and where we stand to-day in our relationship with the public. At this point one is tempted, particularly in the presence of an audience composed largely of other than the medical profession, to review the glorious record of achievement of the last half century. Even in my own time the forward march of the basic medical sciences and of medicine, surgery, and all the specialties has been almost unbelievable. This era of glorious advancement which has

I. Ridgeway Trimble Lectureship presented at the Sesquicentennial Celebration of the Medical and Chirurgical Faculty, April 25,1949, originally published in the July, 1952, issue of THE JOURNAL, and reprinted here at the suggestion of the son of the doctor in whose memory the lectureship was established, I. Ridgeway Trimble, president of the Johns Hopkins Medical and Surgical Association. The late W. Edward Gallie, MD, was a professor of surgery and dean of the Faculty of Medicine at the University of Toronto.

seen the establishment of our mastery over typhoid fever, diphtheria, pernicious anemia and diabetes, over surgical infections and the hidden diseases of the abdomen, the thorax and the brain, has occurred in the stimulating atmosphere of free enterprise and has been brought about by the unfettered enthusiasm of crowds of young people like Osler and Cushing here and like Banting and Best in my own country.

And as I think of this glorious era I cannot help wondering if it could have happened under state medicine. Would the fires of research have glowed as brilliantly under bureaucrat direction and political control as they have in the immediate past? Could management by the civil service have been as successful in attracting these bright young minds to the study and solution of the problems of health and disease? My experience with politics and the civil service makes me doubt it and makes me think that we should avoid at all cost the introduction of socialistic changes which could so easily kill the goose that laid the golden egg

This craze for socialized medicine is part and parcel of the general demand for social security. It is not a criticism of the quality of the service we are giving, but rather of the cost of it. And when one considers the colossal bills that follow an ordinary illness such as pneumonia or appendicitis, one cannot help sympathizing with the low income citizen when he looks about to see if he cannot get somebody else to pay for it.

The remedy is not too clear at the present time, but in my opinion it should centre on this problem of cost. Some scheme must be discovered which will lessen the load of the ten to twenty dollars a day charge of the hospital and the ten to twenty dollars cost of the nurses.

But in searching for means of reducing the cost of illness, what folly it would be to destroy the good will of the doctors and to make them sorry they had ever come into the profession. The spectacle of what is going on in England and New Zealand, with their schemes of state medicine, is quite enough to drive bright and clever young men into other fields of endeavour. At any rate there will be no sons of doctors entering medical school if state medicine comes. I would venture to predict that with the advent of socialized medicine, as it is advocated by the socialist and communist parties, this golden age of medical discovery will come to a close and we shall enter a period when progress in the study of health and disease will bog down to the speed of the civil service. The idea that medical research can be kept alive by government grants is just silly if it turns out, as I think it will, that the bright boys no longer want to be doctors and will no longer enter the schools.

The appalling cost of illness is largely due to the rise of hospital rates and to the cost of nursing care. Fifty years ago when we took sick we went to bed at home and the doctor came to see us there. To be sent to a hospital seemed like a death sentence. Now, however, largely due to our advocacy of the virtues of hospitals and to the development of the "Blue Cross" and other insurance plans, everybody wants to go to the hospital on the least provocation. The result is an outburst of hospital building at such fabulous prices that the daily rates can do nothing but rise. How we are ever going to get nurses enough to staff these new hospitals is beyond me, for I am convinced that, with the rising demand of industry, of public health, of aeroplanes and of the public schools, for trained nurses, the chances of getting nurses enough to take care of the sick are steadily growing less. Indeed, I feel sure that the day of a plethora of nurses is over and that it is time we were thinking of how we can do without them.

First, let us consider the hospitals. Do we really need the enormous increase of hospital beds that is now being demanded? How many are being occupied by patients who have been sent in for complete laboratory investigation and for observation and who really do not need to sleep in the hospital at all? It seems to me that a great many are in this class. Would it not be preferable, instead of building hospitals, to build clinics where a patient could undergo a complete investigation and then return to his own home? This would speed up the programme, reduce the need for nurses and cut down the expense. It is certainly worth thinking about before calling in the architects.

The problem of the nurses is occupying the attention of hospital administrators and the nursing schools all over the world. The other day I saw a big sign in the Strand in London, England, announcing that the governments of Australia, New Zealand, and South Africa would welcome applications from young British girls to go out to those Dominions at government expense and on

specified salaries to train in hospitals as nurses. The shortage, indeed, is universal.

The reasons given are varied but they all seem to boil down to the fact that to many, nursing the sick has lost its charm. In earlier days a high proportion of the girls entered training schools in the spirit of Saint Anne, gladly devoting their lives to the service of the sick and accepting as their reward the gratitude of their patients and the hope of happiness hereafter. Gradually, however, nursing has changed to a profession, an ill paid one at that, and one that requires high standards of preliminary education and years of special training. In the presence of ever increasing opportunities for young women in business, in pedagogy and in countless other fields, with limited hours of work, week ends off and higher pay, it is no wonder that volunteers are lacking. What the solution is I do not know, but I suspect that it lies along the way of learning to get along with fewer trained nurses, who will occupy the posts of greater responsibility with pay and living conditions such as to attract bright young women, and filling in the vacancies with a lower grade of personnel. However, this is a problem not for the doctors but rather for the hospital administrators and particularly for the nurses themselves. No solution will be satisfactory that does not come from them and carry their staunch support. My only purpose in mentioning it at all is to emphasize what many of us think, that the shortage of nurses is permanent and urgently calls for thought.

Returning to a consideration of the changes in medical education and in practice since Osler delivered this lecture sixty years ago one cannot fail to be impressed with the enormous progress that has been made. What the great physician advocated that night, namely a reformation in clinical teaching and the setting up of high standards for hospitals and medical schools and for licensure to practice, have all been brought about, and, mark you, have been brought about by the doctors themselves. The idea that this kind of reform could have been brought about by any government bureaucracy is the sheerest nonsense.

These sixty years have seen the rise of the internist, the surgeon, and the various kinds of specialists. It is but natural that, with the enormous broadening of the field of medicine, practitioners have been forced to concentrate on narrowing portions of that field in order to maintain a standard of excellence. There are many of us, however, who feel that this swing to specialism has gone far enough and that a little more attention should be paid to the general practitioner. Indeed, for some reason or another, the public seems to have lost a great deal of its former respect for the old style family doctor, and rushes off at once to whatever specialist seems to be most suitable to their particular complaints. It is amazing how often nowadays patients come in who state they have no family doctor and who are quite surprised when I decline to see them except at a doctor's request.

This is most unfortunate for I am convinced it often leads to poorer instead of better service. The ideal family doctor is competent to diagnose all but the most uncommon ailments and he is familiar with the treatment required. If he really is the family doctor he is also a trusted friend who can be depended upon to call the proper consultant if another opinion is needed and to select the most suitable specialist if special treatment is required. Above all, he knows his patients far better than any chance consultant ever can and, being their trusted counsellor and friend, he has their interests close to his heart. When I get sick I want my old family doctor; none of your specialists for me.

But just as Sir William advocated an increase of the medical course from two to four years, with emphasis on basic sciences and clinical study at the bedside so I have to recommend, sixty years later, another extension of the programme of training. It seems to me that with all the advances that have been made in medicine, pediatrics, obstetrics and minor surgery it is impossible for a student, no matter how diligent he may be, to get a practical grip of his subject in four undergraduate years. Almost all this time he has had his nose on the grindstone with lectures, clinics and laboratories and is awake at all hours of the night preparing for examinations. At no time is he given responsibility for sick patients or given the opportunity actually to be the doctor. The result is that while at graduation he has had a better basic and theoretical training than ever given before, yet he has not had sufficient apprenticeship to fit him for actual practice.

To get over this defect in his education he needs a general rotating internship. This, I be-

lieve, should be compulsory and required by the laws of the state or province for licensure. This is actually the law in some places, but it is by no means universal. Some of the leading hospitals associated with medical schools do not have a rotating internship at all. It seems to me that an adequate preparation for general practice requires an internship which includes six months medicine, six months obstetrics and pediatrics and six months minor and emergency surgery, including fractures. If to this were added six months or a year of training with a busy practitioner the course would be complete. Such a plan, of course, would require that hospitals pay the interns a sufficient honorarium to make them independent.

But while making an adequate internship compulsory for licensure would be a great advance, it would fall far short of the ideal unless the medical school takes a much more active interest in the welfare of the intern than it has done in the past. It is notorious that in many hospitals the interns are simply servants who carry out routine work without any pedagogic supervision or spiritual stimulus whatsoever. Everybody must have observed how frequently the lean, alert, anxious medical student degenerates during his first six months as an intern. This comes from the too sudden release of the graduate from the discipline and supervision of school. What is needed is a more gradual transition from the rigours of medical school to the independence of practice. It calls indeed for a continuation of the curriculum of the school into the intern years, with sufficient clinics, discussion classes and practice demonstrations to make sure that the intern is getting the best out of his service. What I am suggesting, indeed, is that we cease to look on interns as servants of the hospital but rather regard them as post-graduate students whose quality as practitioners of medicine will depend largely on our skill as teachers. I am suggesting that we make it impossible for the intern to complete his training without having done, and accepted responsibility for, all the things he must do in practice.

Of the rise of the specialist since sixty years ago, so much has been said that I need only touch on it. Indeed I know very little about it except as it applies to the surgeon. These sixty years, however, have seen an extraordinary change in his education and in his practice. At the beginning he was a general practitioner who had a special interest in operative work and had ultimately become proficient in some of the common procedures. Gradually, however the field became wider including the hitherto unexplored fields of the abdomen, the chest, the nervous system and the bones and joints, so that it became necessary for the budding surgeon to spend years in training before setting up in practice. To protect the public in this period of change, the American College of Surgeons and the American Board of Surgery in the United States, and the Royal College of Physicians and Surgeons in Canada, have been set up to establish the standards of training that are necessary to efficient service. As yet these standards have not been made obligatory, but the time is not far distant when they should be. Just as Osler pointed out the necessity for obligatory standards for the general practice of medicine I now urge that consideration be given to the limitation of major surgical practice to those who have been properly trained for it. The notion that a degree from a medical school and a license to practice granted by a state or provincial board is sufficient qualification for a man to engage in any kind of practice is nonsense and should be corrected as soon as possible. While it is obvious that to bring in restrictive legislation too suddenly would cause hardship and arouse so much resentment and resistance that the needed reform would be retarded, I feel sure that if the problem is handled wisely both the public and the profession will agree to proposals that guarantee that the practitioners to whom are entrusted the lives and limbs of our patients have been adequately trained. Just as there are now minimum standards set for licensure for general practice so there should be minimum standards, such as those required by the Boards, for license to practice a specialty.

In these times when various forms of socialism are sweeping over the world it is particularly important that we should retain the confidence of the people. We have been and still are looked upon as an honourable profession, doing our daily work because we like to do it and concerned more with the service we give and the satisfaction we get out of it than with its pecuniary rewards. It is very essential, just now, however, when people are resenting the rising cost of medical care that we do not occupy a prominent place in the general clamor for higher pay. I really believe that the

most useful service we could give to the public as well as ourselves would be to do everything possible to reduce those rising costs. The lavish use of expensive drugs, the multiplications of x-rays and the free use of physiotherapy make the bill that the patient must pay on leaving the hospital truly astronomical. Over and over again I have heard of low income people such as university professors who literally had to mortgage the house to pay for an illness. Now while the doctor's bill is a mere fraction of this cost, yet the patient is inclined to blame the doctor for it and to a certain extent he is right.

The other day a friend of mine, a professor of mineralogy, consulted his physician about some discomfort in the upper part of his abdomen. After taking the history the doctor decided that hopitalization was necessary in order that a complete investigation could be carried out. The patient entered a hospital on a Friday night, but by that time the physician had gone out of town for the week end and he did not get back till Monday afternoon. He then ordered a gastrointestinal series, a gall-bladder series, chest and spinal x-rays, an electrocardiogram and the whole list of blood and urine analyses, with particular emphasis on liver function tests. He wanted to make sure that nothing was overlooked. So all his investigation was completed and one by one the tests were reported negative. In the meantime the patient had completely recovered from his indigestion. He left his ward with a spring in his step and the light hearted feeling of one who has had a narrow escape from catastrophe. This lasted till he reached the wicket where he received his hospital bill. Then all the symptoms returned with threefold intensity. The fact that the doctor, being a fellow member of the faculty and a personal friend, didn't send him a bill, didn't seem to help.

I suggest, therefore, that we do not send anyone into a hospital not urgently needing to go, that we pause a moment before ordering a list of expensive clinical investigations that have no direct bearing on the case, and that we reserve the use of antibiotics and whole blood for patients who really need them.

It is particularly important in these changing political times that we do not leave ourselves open to the charge of commercialism. Of course we want to make a decent living and to have incomes that will enable us to live in social equality with those of a similar cultural status to our own. But we should also have the credit for the perfectly enormous amount of service that we render without any charge whatever and without a hope of financial reward. The public can hardly be made to believe that the staff appointments to our inpatient and outpatient services carry no salaries or honoraria. But much more spectacular than the day by day free contribution of the doctor to the general public welfare are the wonderful gifts to humanity that have been made by medical research.

The one that I know best is that in relation to diabetes, for once upon a time Sir Frederick Banting was my house surgeon and Charles Best was my student. When one realizes that there are nearly a million diabetics in the United States and Canada who are being kept alive and in good health by insulin, what a killing those two boys could have made if they had capitalized on their discovery. If for instance they had sold their process to the manufacturers with a royalty of one cent a day from each patient, that would have amounted to $3 million a year. And that they did not do this was no mischance for I can assure you that I listened one night twenty-five years ago to a full discussion of the subject by the insulin committee of the University of Toronto, where with a complete realization that the discovery was a success and that the income that could be derived from it would be enormous, the discoverers in cold blood decided to live up to the traditions of our profession and to hand over their discovery to the world. This is something that is understood neither by capitalists nor communists, but it is one of the glories of our profession that make us resent the suggestion that in the future we are to be pushed around by bureaucrats and civil servants. It is my firm conviction that if thirty years ago medicine had been socialized on one of the plans now being threatened, Frederick Banting and Charles Best would never have registered in a medical school and the diabetics would have been dying of coma as usual.

It is my pleasant duty to bring to you the greetings of the Canadian and Ontario Medical Associations. Just as you represent the doctors of Maryland and of the other United States, so our Canadian Associations speak with authority for the medical profession in Canada. Our association with you in times of peace, over the last hundred

and twenty years, and in times of war, in the last thirty years, has done nothing but raise our admiration for you. The kindly way in which the Canadian doctor is received in the United States never fails to astonish us and to arouse our deep appreciation.

In these anxious times when there hangs over us the threat of atomic war and we figuratively scan the northern skies in search of enemy aircraft it may be comforting to you to know that here and there along the shores of the Arctic Ocean and of Hudson's Bay are increasing groups of Canadian airmen and radar experts. This was brought home to me most forcibly when a well-known surgical colleague, one of the senior medical officers of the Royal Canadian Air Force, flew to Baffin Land to inspect the medical arrangements in that far Arctic post. It is just unbelievable.

One thing we Canadians are terribly keen about is that the proposed St. Lawrence waterways scheme may be proceeded with soon. By building canals to bypass the 75 miles of rapids in that great river we can open it to ocean navigation for an increased thousand miles and convert the ports of Cleveland, Toronto, Detroit, Chicago, Fort William and Duluth into ocean ports. Just as the completion of the Panama Canal made commerce originating in one ocean available to the other, so the St. Lawrence waterways will extend that commerce from the outside rim to the very centre. Strategically, too, its importance is enormous. While I know that New York, Boston, Philadelphia and perhaps Baltimore are not very keen about seeing some of their shipping proceeding up the St. Lawrence, yet in time of serious war, the more we are spread out and the less vulnerable we are to atomic bombs the better.

Just to guard against a possible feeling of disappointment among the more scientifically minded of my audience that I have said very little about practical surgery, I shall dwell lightly on a curious cult that has developed recently among the surgeons. From time to time I have held forth against the indiscriminate introduction of foreign bodies into the delicate human organism and have pointed out the evils that may result from this unscientific practice. Now, however, I would draw attention to a growing habit of dealing with certain injuries and diseases by cutting off the offending part and throwing it away. It would suggest that our faith in a Divine Providence has become so undermined that we have begun to look critically on what we have always been taught is the noblest work of God. The suggestion is that perhaps, after all, the hand of the potter does shake. The other day there came under my care a great professional hockey player who had fractured his patella. All my young colleagues told me that the newest and best treatment would be to remove the patella; simple, free from danger and effective. Now, of course, I knew all this and have seen results that would be quite good enough for the knees of those young doctors, but I had to remember that my patient was a great centre player and that one reason he was sent to me was that I also had been a hockey player and knew something about the kind of knees that centre players must have if they are to continue to play that great game. So I stuck to the old accepted plan of trying to restore the poor boy to the mould in which God made him.

The speed with which the "cut off and throw away" cult has developed is amazing. It used to be limited to feet and fingers and hands but now it includes patellas, olecranons, clavicles, gall bladders, cecums, colons, stomachs and lungs, and when the technique for each of these has been perfected we are calmly told that no ill effect from the loss of the part can be detected. The climax, as far as I am concerned, came not long ago when the neurosurgeon brought in a patient from whom he said he had removed one cerebral hemisphere And sure enough, there was the hemisphere in a bottle. I asked the man how he felt about it and the mumbled reply did not impress me. The surgeon assured me, however, that the patient had always talked like that and that the loss of half his brain had seemed to have no ill effect whatever.

Well, I must not go too far in this discussion for fear I leave a wrong impression. I think it is well worth while, however, for the surgeon to pause when he feels the urge to cut off something coming over him, and consider that, while it is interesting and often very important to know that man can get along without some of his parts, in the millions of years in which the process of evolution has been going on the chances are these parts have gotten used to one another and might not play the game quite so well if some of them were missing. It might be well if these enthusiastic surgeons, before trying out these

newfangled stunts on their patients, did as Banting and Best did when, before giving the new drug "insulin" to their patients, they tried it out on themselves.

The association of our tenth province, Newfoundland, with Maryland reminds me that the other day in London certain sentimental people gathered about the great equestrian statue in Whitehall to mourn the passing of the king who sent Lord Baltimore to America. It is a bright commentary on the character of the English people that there are some who every year, on January 30th, stand about this statue and drink a toast to the rightful king (over the water). The Lord only knows who the descendant of the Stuarts really is. Certainly the Jacobites do not. And while the toast is being drunk another crowd looks on with an amused yet sympathetic smile and then all move off together as loyal subjects of King George the Sixth. A great and interesting people, but to us on this side of the Atlantic, sometimes hard to understand. King Charles the First was not a wise king, and he certainly was a most unlucky one, but in his magnificent exhibition on the scaffold of Whitehall he made a glorious atonement. So when January 30th comes around, you in Maryland, so named in honour of his queen, who could not possibly drink to a king named George, may raise a glass with me, a descendant of Scottish Jacobites, to Charles Stuart, the founder of your country and to Mary his queen.

THE FINANCING OF A MEDICAL EDUCATION: WILL THE HOUSE OFFICER BECOME THE FORGOTTEN MAN?

M. J. ROSENHOLTZ, MD
Assistant Dean of Student Affairs
University of Maryland School of Medicine

The costs to an individual of funding his medical education from the first year of college to the last year of residency are extraordinarily high. A detailed study of medical students during the 1963-1964 academic year shows, for example, that the average unmarried student spent $2,713 for all costs, including taxes, while the married student without children spent $4,797.[1, 2] Subsequent increases in school and living costs would make those figures higher at the present time.

No comprehensive study of the costs of house staff training is yet available. However, in 1965-1966, the average intern salary, exclusive of fringe benefits such as food and housing, was $3,578 for physicians in hospitals affiliated with medical schools and $4,071 for those in non-affiliated hospitals.[3] First-year-resident salaries, similarly computed, were $3,818 and $4,059, respectively.[3] These facts, superimposed on the observations that about 60% of senior medical student are married,[1] and that perhaps one-fourth or more have significant non-family debts at the time of graduation,[3] point to important financial problems for house officers. Much concern has been expressed about the relatively high family-income groups from which many medical students come.[1] One might seriously ask how much self-selection occurs among potential pre-medical students of relatively low income as a result of the long-term funding problems hinted at above.

The opinions of the author are not necessarily those of the University of Maryland School of Medicine.

For background information, non-family sources of financial aid to medical students in 1965-1966 are summarized in the Table.[3]

Source	*No. of Awards*	*Average Award*	*Funds Expended (million)*
School loans	3,372	$483	$1.63
AMA-ERF loans	3,928	$1,089	$4.28
Federal loan programs	11,488	$865	$9.88
Other loans	2,164	$802	$1.74
Total loans	20,952	$837	$17.53
School Scholarships	6,367	$709	$4.51

Clear-cut changes are occurring at the present time, however, in the pattern of medical students' funding of their education almost entirely as a result of two important Federal programs. The early growth of the first, the Federal Health Professions Loan Program of 1963, is apparent in the Table. Loans from this source are interest-free until repayment begins three to five years out of medical school. At that time, simple interest at the going federal rate, presently 4.62%, on the unpaid balance begins to accrue. The repayment period is ten years.

The second federal program for medical stu-

dents, the Federal Health Professions Scholarship Program of 1965, is quantitatively much smaller but far more select: scholarships may be offered to students of "low income families who could not otherwise continue their studies." Such grants first became available during the present academic year. At the University of Maryland School of Medicine, for example, 13% of the Class of 1970, the only class presently eligible, are receiving such support, with average stipends of about $1,100. The regulations allow the Faculty to establish a "reasonable" total educational debt limit for such students; at Maryland it will be $5,000.

The expected further growth of these two critical federal programs should at least move medical student funding of education in the direction of the goal described by a large number of students in 1960—one-third from each of the following: (1) the student, his family, and/or spouse; in the form of current income or savings; (2) society, in the form of scholarships; and (3) the student, in the form of future indebtedness.[4]

Particular note should be made of the American Medical Association's loan program. In each of the three academic years, 1963-1964, 1964-1965, and 1965-1966, this fund has been the source of a little over $4 million loan money for medical students.[3] In contrast, federal loan programs grew in those academic years from $2.9 million to 6.2 million to 9.9 million, respectively.[3] American Medical Association loans, basically bank loans guaranteed by the AMA-ERF Fund, are significantly different from those provided through the federal programs in that they may be given both to students *and* to house officers. Originally, an AMA-ERF loan was limited to $1,500 per year; 5.5% interest began to accrue at once, but no repayment was necessary until the physician had finished his house staff training. He then had 10 years for repayment on a new note bearing 6.5% interest. Because of the high cost of money at present, maximum loans have, unfortunately, been reduced to $750. Furthermore, not only have the interest rates recently risen from 5.5% and 6.5% to 6% and 7%, respectively, but the 6% interest due for the education and training periods must now be paid as it accrues.

What are some of the implications of financial aid and obligation as they pertain to the house officer? In unpublished work we have undertaken at the University of Maryland School of Medicine, there is the preliminary suggestion that students with large debts or with children tend to seek out internships paying relatively high salaries. In some instances, such house staff experiences have appeared to substitute financial reward for quality of training. At the opposite end of the spectrum, many teaching hospitals have paid small salaries and then reacted strongly against their house staff for "moonlighting" activities. In contrast, with the growth of the federal loan program, medical schools, including Maryland, feel far more secure now about strongly discouraging weak students from outside employment during the academic year.

From the long range viewpoint, the possible impact on the young practitioner of his high debts and previously austere living standard, on the one hand, and of his sudden access to the patient's money, on the other, seems alarming. Other long-term problems worthy of careful scrutiny almost certainly have arisen for the medical student and house officer as a function of his prolonged dependency on his family for financial aid and his and his spouse's ambivalence about when to start a family. Certainly, the family and financial pressures on the young physician in training are much greater, age for age, then those on other bright, productive, and highly educated members of society.

What hope is there that some of the potential and real financial problems of the house staff period will at least decrease in intensity? As noted, the house staff member's key source of financial aid other than moonlighting, ie, the AMA-ERF loan, has recently been cut to only $750 per year. Furthermore, a bank loan without the backing of the AMA-ERF is often quite difficult for house officers, a peripatetic group, to obtain.

Should and will government intervene in some fashion to rescue the house officer from his financial plight? The favorable impact of federal policy, for example, on the financial problems of the *medical student,* in striking contrast to the continued predicament of the *house officer* in the absence, to date, of any such policy suggests that it should; the concerns of three federal programs suggest that it will: Both (1) the Medicare-Medicaid program, under Public Law 89-97, and

(2) the Regional Medical Programs for Heart Disease, Cancer and Stroke, under Public Law 89-239, can be expected to become increasingly involved with services to patients and thus with the house officers who supervise or provide them; and, although research grants will of course continue to comprise the larger portion of (3) the Public Health Service Research and Training Grants, the PHS appears to be showing an increased interest in training grants.

In summary, the financial problems of the medical student are seen as serious, but easing, and those of the house officer as severe and likely to be more so. It is to be hoped that the next few years will see real advances in this key area.

PROGRESS AND STAGNATION IN PSYCHIATRY DURING THE PAST FIFTY YEARS

CHARLES E. GOSHEN, MD
Director of Community Services
Brook Lane Psychiatric Center
Hagerstown, Md

The merits of our mental institutions can now be evaluated on the basis of a century of experience. Although there is still widespread disagreement on theories of psychiatry, substantial advances have been made in general endorsement of the practices of psychiatry insofar as patient management is concerned. Some of these areas of agreement involve concepts first promulgated from 50 to 100 years ago. A brief history of theories and practices is presented, today's mental hospitals are assessed and steps necessary for their continued improvement are recommended.

It seems fitting and appropriate, on the occasion of any anniversary celebration, that we pause and reflect on the lessons which history has to teach us. As others have pointed out before, we have only two choices with respect to history: either we study it or we repeat it. In other words, we either learn from the past or repeat the mistakes of the past. The half-century which has passed since the founding of this hospital has represented the most dramatic phase of all civilization. Probably more changes have taken place during this period than in the thousands of years before. A question which must nag us relentlessly asks if the progress which civilization has made during this half-century has been paralleled with a corresponding degree of progress in our own field of psychiatry, and, in particular, a corresponding degree of progress in our public psychiatric hospitals. In the search for an answer to this question, let us, for a moment, imagine ourselves living in the year 1915 and take a look at what was going on then in the field of our interest.

One of the events that took place in that year was recorded in an issue of the journal *Modern Hospitals*. The notice was entitled "Maryland opens a new hospital for the insane at Cambridge" and went on to say: "The group (of buildings) consists of a main hall, laundry and power house. The main hall is 300 feet long and 165 feet wide. It is two stories high, has a cellar under the whole building, and two dormitory wings for male and female patients. All buildings are constructed of rough brick. The second story of the main building is finished in rough cast mortar. All floor construction is of reinforced concrete and the finished floors on the first story are tiled. The new hospital in its present state represents an expenditure of $300,000. As the need increases and more money becomes available, six additional dormitories and an administration building will be erected."

The account is remarkable for its attention to the details of the brick and mortar aspects of hospital construction, and its lack of concern for the purpose for which the hospital was built or might be used—this being presumably implicit in

From an address made on the occasion of the 50th Anniversary of Eastern Shore State Hospital, May 1965

the specification that it was a "hospital for the insane." Such a point of view was representative of the prevailing concepts then, namely that the mere building of institutions to house this class of patients somehow, magically, solved whatever problems these patients presented to themselves and to society.

The most important event taking place in 1915 was World War I. Even though the war was then only one year old, and the U.S. had not yet become involved, psychiatrists were already taking a lively interest in it. The psychiatric condition then called "shell shock" had already been identified, written about and widely discussed. By 1917 at least two complete books had been published on the subject. One in particular propounded a theory which proved very unpopular with psychiatrists, namely that the condition of soldiers called shell shock had something to do with the problems a human being faced in coping with the terrifying prospect of being killed. Much more popular theories suggested that it might be the loud noises of the battle field which brought about these emotional states, the noises having a harmful effect on brain tissue in some unspecified manner. This attitude was derived from prevailing concepts which sought mechanistic explanations for human behavior and resisted the obvious conclusion that the state of fear so often seen in psychiatric patients might be related to the patient's exposure to danger. The mechanistic view was expressed in an article of the *Journal of the American Medical Association* in 1915 by a British psychiatrist who stated "The present campaign in Flanders has made such unexampled demands on the nervous system of the soldier that we are not surprised to meet with many cases of brain damage, manifested as neurasthenia, hysteria, and various disturbances of the special senses."

A president of the American Psychiatric Association during this period offered an interesting observation: He noted that both French and German psychiatrists had reported that there seemed to be no increase in the incidence of psychosis in the civilian population in the war zones, but he asked the cogent question that maybe it would be more appropriate to ask whether or not psychotic people caused the war rather than asking whether or not the war caused people to be psychotic. This objective view of the war was in sharp contrast to a more partisan one expressed by a speaker at an annual meeting of the APA: "When that unspeakable brute, the Prussian Kaiser, that sanctimonious crocodile, drew his hideous and slimy length over Belgium, a good many people sat up, rubbed their eyes and began to take notice." His anticlimactic statement did not go on to say what these presumably observant people noticed, however.

World War I had an important impact on American thinking in many pervasive ways. In a sense, the United States grew up then, became an adult nation and a co-leader of world affairs. This maturation required a breaking away from mother Europe, and the War had a lot to do with the process. As in the case of many other adolescents, it was accomplished by means of a hostile rebellion against the parent in which our own country's "image" was built up by the tearing down of Europe's image. Germany, previously the fountainhead of medical science, became the target of rebellion. In psychiatric circles, this nation-wide move was expressed in a speech given at a meeting of the APA in which an officer of the association stated: "The German scientists excell in their genius for advertising themselves. On a slender basis of achievement they have contrived to impress themselves as the most scientific nation. Never has there been a greater imposture! They display the same cleverness in foisting on a gullible world their scientific achievements as their shoddy commercial wares."

Carrying the same theme to the specific field of psychiatry, he went on to say: "Psychiatrists have been infatuated with German pseudo-discoveries. Novelty of terminology has been mistaken for originality of thought, and their works on insanity have been accorded undue authority." He was alluding then to Freudian psychoanalysis, a doctrine which was then regarded by many as akin to the fear, expressed years later, of creeping communism.

Retreating from the global problems presented by World War I to more local issues, it is interesting to note a prophecy made by a prominent physician of the time. He reported that the British had taken under serious consideration a plan to provide free medical care for the poor, and predicted: "On the American continent little attention has been given to measures of this kind, but it seems probable that, whether medical men like it or not, a similar one will become law on this side

of the Atlantic." It was some time before the issue he referred to became known as "socialized medicine," the war cry of the American Medical Association today.

Another national issue was highlighted in an article in one of the journals and another prophecy made, when the author wrote: "The vendor of quack medicines is busier today than ever. He is a specialist in distortion who probes into the ordinary sensations of healthy people and perverts them into symptoms. Every billboard, newspaper, fence rail and barn thrusts out a suggestion of sickness as never before. The only vulnerable point at which to attack the vicious traffic is the advertising. If the government (passes laws) to forbid this (kind of advertising), the next generation will be healthier and richer." The same author also observed that national prohibition was certain to become law, and prophesied that, once this happened, the evils of alcoholism would finally disappear.

Frequent articles in the literature of 50 years ago came forth with pleas for improving the caliber of personnel working in mental hospitals. Few then were trained people. One article reported a survey of midwestern institutions and found that the average salary of state hospital attendants was $30/month plus maintenance, as compared with double that amount for similar positions in general hospitals. It noted that the turnover before the war had been 75%/year, and urgently recommended substantial salary increases in order to attract and hold better personnel. The article also made a special plea for hiring social workers in mental hospitals, noting that 200 general hospitals had already done this, but no mental hospitals had.

The New York Hospital Development Commission issued a report in 1915 of a survey it had made of the mental hospitals of New York. The report observed that many deficiencies existed in these hospitals and offered the following explanation: "The defects in our hospital system and in the individual institutions are not due either to our very efficient Hospital Commission, or to the management of the separate institutions. Rather, they are due to an unawakened public conscience, a lack of knowledge in the medical profession and the reluctance of the State Legislature to appropriate enough money." It was more common, then, to attribute observed defects to the administration of the individual hospital rather than to the public or the legislature or, least of all, the medical profession.

The literature concerning mental hospitals in that era was largely preoccupied with housekeeping, records and economy. Very little attention was directed toward rehabilitation of the patient. For example, a controversy raged over the relative merits of large, centralized dining facilities for patients. One enthusiastic report from New York State, richly illustrated with photographs, described a major administrative triumph in developing a system for feeding as many as 1,500 patients at one time in a huge dining hall. The report gave explicit details on how this was accomplished. It even suggested that a small orchestra be provided to supply music during the meals, and gave a sample program of musical selections. It recommended that "lively marches" be played as patients entered the dining hall, then "quiet waltzes or lullabies" during the meal, going on to a "rising tempo" of "stirring selections" to induce patients to finish their meals and leave.

On the other hand much attention was paid to cost-cutting procedures, a reflection of institutions' subservience to the penny-pinching attitudes of state legislators. It was during this period that a tradition arose for measuring costs of patient care on a per diem basis (with the greatest status accruing to hospitals which had the lowest per diem rate) rather than on the more meaningful total cost-per-admission basis. Although it was never pointed out then, the hospitals with the lowest per diem costs had the longest average periods of hospitalization, and therefore the largest costs per admission.

Outside of the mental hospital literature, other journals, such as the *Johns Hopkins Bulletin*, published reports and recommendations that were more closely related to the question of restoring the patient to useful citizenship. A number of psychiatrists began to observe that the specialized mental hospitals had become too remote and isolated from the mainstream of community life, and urged the inclusion of psychiatric services in general hospitals in order to make psychiatric care more immediately accessible and acceptable to patients in the earlier phases of their psychiatric difficulties. The Phipps Clinic at Johns Hopkins was a leader in this movement, and it was able to report a much more rapid turnover of patients

than could the State hospitals. Only a half dozen or so general hospitals in the country then had psychiatric services.

Adolf Meyer, at Johns Hopkins, came out with an impassioned plea for the inclusion of psychiatric training in medical school in order to give all physicians a background of skill in handling psychiatric problems in general practice. He stated: "From time immemorial, the physician has been urged to treat not only the diseased organs but also the patient. Of late years we have learned to realize that indeed some disorders can be explained and treated as abnormal ways of living rather than as abnormal functions of an organ. We have also come to learn that the total unified adjustment of the person can be reduced to intelligible processes; to defects of development, intellectual, affective or conative; and to improper use of assets. We teach students chemistry, physics and biology, but not the elements of behavior and mentation. If we do not supply this deficiency in training, the student might be guided into obscure mystical cults and become involved in fads and fashions, and empty squabbling before a justly distrustful public. A new and unnecessary profession of 'clinical psychology' will grow up and fill this gap unless we show the sense and capacity to furnish medical students with the needed training in psychobiology." Meyer's searching analysis and predictions for the future found practically no supporters outside his own domain.

The Massachusetts Board of Insanity issued a report which was echoed by similar observations from a few other sources. The report noted that there were no extensive follow-up services for discharged mental hospital patients, in the absence of which discharge was often delayed and readmissions were encouraged. It made a strong plea for the development of outpatient facilities for following up patients, and suggested that social workers might find a unique and valuable place in these services. The National Committee for Mental Hygiene reported that it had already opened an outpatient mental hygiene clinic in Baltimore which, primarily, handled juvenile problems brought to the attention of the courts, and urged the adoption of this kind of service elsewhere, in the interest of preventing institutionalization.

In the field of psychiatric theorizing, lively debates were going on in 1915, as they had been for a long time. The target of most of the controversy then was Freud, and the principal, but not sole, opponents to the doctrine of psychoanalysis were those who were trying to prove an organic etiology for psychiatric disturbances. By 1915, Freud was well-known in the United States, and his supporters here included A. A. Brill, Smith Ely Jelliffe, and William Alanson White. A psychoanalytic society had been organized in New York City, and a journal of psychoanalysis was in its second year of publication. Already, the field of psychoanalysis had become splintered with its own internal dissension. Jung and Adler had, by then, broken off from Freud to develop what was then referred to as the Swiss School. The argumentation which took place frightened off most of the psychiatric departments in American medical schools, and they tended to rally around Adolf Meyer to oppose Freud.

The organicists were continuing to issue reports which attempted to prove that psychiatric problems were caused by a disease of the brain. One even sought to attribute psychosis to chronic constipation. A prominent psychiatrist of the time, Dr. Southard, a former president of the APA, came out with a thorough-going castigation of psychological theories and submitted autopsy material which "proved" that 90% of psychotic patients had specific brain lesions at the time of death, the site of which determined whether the patient had been suffering from delusions, hallucinations or other psychopathology. Adolf Meyer brought out a rebuttal to these claims with the obvious observation that the autopsy material revealed only the results, not the causes of a lifetime of vicissitude.

The case for the organicists was strongly strengthened, however, by an important discovery of this period. Moore, at Central Islip State Hospital in New York, and Noguchi, at the Rockefeller Institute, established convincing proof that the condition we now know as "neurosyphilis," then known as "general paralysis," was caused by an infection in the brain by spirochetes. Only a few years later, von Jauregg in Vienna discovered the malarial method of treating neurosyphilis. This determined the principal preoccupation of therapists in mental hospitals for the next twenty years, largely to the exclusion of patients there who did not have neurosyphilis.

Medical reports from mental hospitals at the time were replete with articles on the incidence of conditions such as tuberculosis and vitamin defi-

CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety ...helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.

Also available: Ambar #1 Extenabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

Ambar #2 Extentabs®

methamphetamine HCl 15 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming)

BRIEF SUMMARY—**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. See package insert for further details.

Dimetapp® Extentabs®

(Dimetane® [brompheniramine maleate], 12 mg.;
phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.)

up to 10-12 hours clear breathing on one tablet

It's clear—Dimetapp lets your "stuffed-up" patients breathe easy again. Each hard-working Extentab brings welcome relief from the stuffiness, drip and congestion of upper respiratory conditions for up to 10-12 hours. Yet, patients seldom experience drowsiness or overstimulation. The key to success is the Dimetapp formula: Dimetane (brompheniramine maleate)—along with phenylephrine and phenylpropanolamine, two time-tested decongestants. They get the job done... in a hurry.

Contraindications: Hypersensitivity to antihistamines. Not recommended for use during pregnancy. **Precautions:** Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension. **Side Effects:** Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered. **Dosage:** 1 Extentab morning and evening. **Supplied:** Bottles of 100 and 500.

A·H·ROBINS

ciencies among patients, but it was then rare for anyone to consider the possibility that these conditions might be a result of the unsanitary and un-nutritious state of affairs in many of the institutions. This situation was reminiscent of one which prevailed during the 19th century, when many clinical reports discussed the high incidence of a condition among psychiatric patients known as "hematoma of the ear." It was assumed that a condition so close, anatomically, to the patient's brain must be correlated with the brain disease which was initially assumed to be the cause of the mental disturbance. It was many years before it was discovered that these hematomas were the result of physical violence to the patient on the part of attendants. These examples reveal the reluctance of the institutional physicians of the time to conclude that institutionalization itself could have anything but a beneficial effect on their patients.

These little vignettes of 1915 provide interesting glimpses of that period and, though not comprehensive, are representative of the state of affairs at the time. Before comparing this picture with the one which exists today, some remarks are in order concerning the total history of our psychiatric institutions.

It was during the latter half of the last century that the models for the various kinds of institutions we have today were developed. Then, perhaps for the first time in history, the realization spread throughout Europe and the United States that the lot of each man had some bearing on the lot of other men. The rich and the privileged could no longer be complacent in their concept of a comfortable world for themselves without regard to the masses of underprivileged people surrounding them. A major factor undermining this complacency was derived from the medical advances made in the latter part of the 19th century. It was discovered then that the great epidemic diseases, such as typhoid, cholera, dysentery and tuberculosis, were spread by man-made activities. There was good reason to suppose that a permanent reservoir of these killers resided in the poverty-stricken slums of the cities and that common problems of food and water supply and of sewerage disposal were instrumental in spreading contagion. The privileged leaders of society came to realize that they were not immune to these plagues and that, as long as they prevailed among the poor, those who were better off socially and economically could be damaged by them. This awareness started a middle class revolution to clean up the cities in order to reduce these dangers, and these efforts took the form of cleaning up the poor. Again, with good reason, the middle class leaders assumed that their own standards of cleanliness, sanitation, nutrition, etc., were superior to those of the poor and if the former could be instilled in the latter then all would be protected from the contagion which was rampant.

The adoption of middle class standards was a slow and difficult process, however, partly because they entailed large public expenditures, and partly because the level of sophistication of the mass of the people was not high enough to excite ready cooperation. One of the possible solutions to this problem was to create artificial environments in which the less fortunate would be placed, and where control of sanitation, nutrition, etc, fell under the care of the more sophisticated elements of society. This was the philosophy which provided the justification for the institutions which developed in the last century—prisons, orphan asylums, schools for the retarded, general hospitals, homes for the aged, and, of course, mental hospitals.

It became further apparent that the people who were placed in these institutions were, thereby subjected not only to middle class standards of living, but also to middle class standards of morality. This realization further justified the concept that those who operated these institutions knew better than did the inmates what was good for the latter. Such a philosophy did not need open expression to be promoted, but became a tacit assumption in the development of our system of institutions. It must be said, however, that there was then some validity to it, for no matter how badly these institutions were run, they often provided a substantial improvement over the environment from which the inmates came. It can now be stated affirmatively, that whatever good was accomplished by institutional care during that period was determined by the degree of improvement in the life and environment otherwise available to the people served. The same can be said today, although conditions have changed greatly during the last century. There is much more doubt now than there was then, however, that the institutional environment is a better alternative than what is available outside.

The great institutional experiments of the past

century are examples of what we call today "social engineering" in that they represented attempts to create controlled environments not subject to the laissez faire processes in the evolution of our urban and rural communities. The hundred years of experience now at hand should enable us to judge whether these institutions have, in fact, lived up to their promises, and if there is still a place for them in modern society.

Hardly anyone today believes that our **penal institutions** have had a beneficial effect in deterring crime or in rehabilitating the offender. A number of dramatic reports have come out in the past 25 years to show that **orphanages** create more problems than they solve, and the findings have resulted in the closing of most of these institutions. Fortunately foster care and adoptive homes have been available as alternatives to the orphanages, but no alternatives to prisons have yet been created in our country. Institutions for **the aged** are generally regarded as falling far short of the kind of decent and humane care we would want for our own aged relatives, but better alternatives are only slowly evolving and are far from commensurable with the rapid increase in our aged population. Some European countries have done much more than we have in creating decent, livable communities for their older citizens. **General hospitals** are beginning to be looked upon not as places to house people during illnesses, but as places where it is convenient for physicians to administer very specialized treatment and diagnostic measures for only very brief periods during the course of illnesses.

Turning our attention back, now, to the problem of our **mental hospitals,** let us ask ourselves if the things we have learned in the past fifty years about the treatment of psychiatric problems are adequately expressed in corresponding advances in the building and management of these hospitals. Those of us who are intimately involved in the inner circles of psychiatry are both more impressed and more dismayed than those outside by the persistent turmoil of controversy which still prevails among us: we cannot say (and we should be ashamed to admit this) that we are any farther ahead now than we were in 1915 in arriving at a consensus in the matter of *theory*. For example, there is probably no one single theoretical point of view subscribed to by more than 20% of today's psychiatrists, and the most popular theories are probably the most incorrect ones.

We have, however, come closer together in the *practice* of psychiatry. A substantial number of solid advances in patient management are now widely endorsed in principle. Invariably these areas of agreement involve rather obvious, commonsense concepts from which physicians have frequently strayed far afield in the past. For example, in the 1850's, over 100 years ago, Thomas Kirkbride (then superintendent of the Pennsylvania Hospital in Philadelphia) led the way toward getting the American Psychiatric Association to adopt "26 Resolutions" declaring its consensus on the matter of certain basic guidelines in the management of mental hospitals. One of these resolutions was the firm assertion that no hospital should have more than 250 beds, that number being the largest number of patients which it was thought the medical director could get to know personally. Within ten years of the passing of this resolution, however, public mental hospitals had grown to more than double that size. Since then, the 300 public mental hospitals have grown to an average size of 1500 beds, while the largest one, in New York State, has 16,000 beds! The final report of the Joint Commission on Mental Health and Illness, "Action for Mental Health," which is currently serving as the "bible" for mental health planning, recommends that these hospitals be reduced to less than 1,000 beds in order to be manageable. This idea is now widely accepted, and some states are taking pride not in how big their hospitals are, or in how much they are growing, but in the degree to which they are succeeding in reducing the number of beds. As a result of this reversal to Kirkbride's original policy, there has been a small, but constant decline in the total patient population since 1955. One hospital in Iowa has achieved a remarkable reduction in beds from 3,200 a few years ago to 800 this year. The state of Massachusetts now has a policy of "bed liquidation," whereby substandard buildings are steadily eliminated and are not replaced by new ones.

Another area of common agreement encompasses the realization that institutionalization, itself, creates problems. It is recognized now that the longer a patient stays in a hospital the more difficult it becomes to get him out. This happens as a result of several factors. In the first place, the passage of time in the hospital is often accompanied by a progressive abandonment of the patient

by his relatives, his friends and the community—leaving nothing on the outside to which the patient can return. Secondly, since institutional life removes personal responsibility from the patient, he is likely to become increasingly dependent upon the institution, and his independent existence outside is thus jeopardized. The danger of prolonged hospitalization becoming permanent is so great that it pays to take long chances, if necessary, to get the patient out as soon as possible. The risks the hospital and the patient take have to be shared with the family and the community, and the reluctance of the latter to take such a risk is one of our greatest obstacles today in rehabilitating the patient.

Another rather obvious concept which hospitals generally accept today, but had largely forgotten during previous generations, is the one that advocates the involvement of patients in useful employment during hospitalization. Failure to do so is a prime factor in making patients dependent upon the institution.

The mass herding of patients in hospitals, practiced in the past for purposes of economy, is widely recognized as another factor which robs patients of individuality and initiative. More thought is now being given, therefore, to the management of patients on an individualized basis. Little things which help bring this about include replacement of uniform dress with individual variations, facilities in which patients can keep and care for personal possessions, smaller wards and smaller dining areas.

The proposals cited above from the 1915 era for outpatient follow-up services were extremely timely then, but very little has been done to implement them until recently. The necessity of developing a network of community clinics for early treatment as well as for follow-up of discharged patients is now recognized on a grand scale. The federal government has launched an extensive program to help and encourage the states to do this, and the development of local facilities is well under way. In spite of the commendable strides being taken in this direction, however, the total amount of money spent by Maryland and neighboring states is still only four to six percent of the state's mental hygiene budget—a ratio which falls far short of what this important expenditure should be.

In the recent past, administrators tended to take pride in how small a staff they required to run the mental hospitals and in how cheaply they could be hired. Fortunately, this type of economy is no longer considered a source of pride. The effectiveness of treatment must depend upon the number and quality of the hospital personnel, and the realities of manpower competition today are such that the upgrading of personnel, quantitatively and qualitatively, costs more money. This does not mean, however, that total costs are thereby increased. Numerous examples of recent experiences are now on record showing that substantial increases in personnel budgets are so effective in reducing average length of stay, and therefore total patient population, that total expenditures are reduced.

This finding suggests that state administrators should consider the costs of operating state hospital systems from two separate and independent viewpoints—that of the patient's "standard of living" and that of the "standard of therapeutic care." Increases in expenditure to improve the former are humane procedures which make for good public relations, but may have very little to do with the prime mission of restoring the patient to useful citizenship in his community; on the other hand, increases in expenditure for improvement of the latter, though less likely to serve a public relations purpose, are more effective in rehabilitating patients. The bulk of the expenditures which determine the level of patient care will be those spent to pay treatment personnel. At present this expense amounts to only about 10% of total state mental hygiene costs, the other 90% paying for goods and services which establish the "standard of living" of patients. In general hospitals, these two sets of costs are more nearly equal.

Let us now direct our attention to another subject of prime importance, and that is the community which the mental hospital serves. It is fashionable today to speak of "community psychiatry," and both the public at large and the professional mental health workers are joining forces to bring about a better level of cooperation. The American taxpayer is a much more sophisticated person today than he was in the past and can be expected to demand not only economy in the expenditure of his tax money, but also a high quality of service. He is very likely to realize that cheap roads, cheap schools, cheap teachers are, in the long run, more expensive than good roads, good schools, good teachers. If we were more diligent in educating Mr. Taxpayer and his rep-

resentatives to the state legislature, we could also expect him to demand good, not cheap, mental hospitals. He probably does not know, however, what makes good mental hospitals, since he is presented with few opportunities to visit them, or to study or appraise the effectiveness of their operation. He has been accustomed to think that the prime function of a mental hospital is much like that of a prison—to remove from ordinary society those people who exhibit unacceptable behavior. As long as he sees the mental hospital in this way, he is going to find very little reason to support increased appropriations for psychiatrists, psychologists, social workers or clinics.

It is encumbent upon us to teach the public that the people whose behavior is distressing either to themselves or to others need treatment and guidance, not isolation and abandonment. Once we achieve this educational objective, we can then show how a mental hospital would, ideally, serve as one resource in a broad network of treatment services which would also include community mental hygiene clinics, psychiatric services in general hospitals, school guidance programs and family welfare agencies, among others. As one of these resources, the mental hospital would be a place where a few patients might be sent, for brief periods of time, as part of a treatment plan and not as a frantic and desperate move to rid the community of one of its citizens. This philosophy has already received widespread acceptance in England, largely because that country could not afford the luxury of indefinitely segregating in its institutions the large percent of the population we segregate in ours.

We must ask the community to share with us some of the risks it is necessary to take in order to give patients a chance, outside of the hospital, to make it on their own. As we develop better treatment services, however, we can promise the community that the addition of local guidance facilities adds a new safety valve that was not available before. The essence of risk is that we might sometimes win and we will, inevitably, sometimes lose. When we lose, as we do, for example, when a discharged patient commits suicide, let us weigh this against the times we won before crying out in alarm to demand that every doubtful patient be locked up. Let us remember that before the advent of the surgical treatment of appendicitis no one died from operations, but a great many people died of untreated appendicitis. Now a few people die of operations, but practically no one dies of appendicitis. For psychiatric patients, the greatest losses are measured in the great number who spend nearly their entire lives in hospitals. To reduce the risk of these losses other risks must be taken, and these other risks, though they do exist to some degree, can be shown to be much smaller than they are thought to be.

The family physicians in the community are especially crucial in determining the course which mental health services will take in the future, since it is through them that patients get referred for care. Too often physicians have the idea, when they see a relatively minor psychiatric problem, that nothing special needs to be done, and so they give the patient a pat on the back and a bag of pills. If the troubling problem is not solved then, when it is minor, it is likely to grow to a major one and then, too often, frantic attempts are made to commit the patient to a mental hospital. Early recognition and effective, specific treatment can accomplish more than any other single move in preventing the development of the complex problems which become so difficult to solve when patients are hospitalized. Much of this can be done by the family physician himself without referral, but he will probably need a little more knowledge than his training has prepared him for, and perhaps more consultation.

In conclusion, let us focus on our reason for being here—the celebration of the 50th anniversary of the Eastern Shore State Hospital. As hospitals go, this is neither very old nor very young. The hospital has certain unique advantages which could be helpful in guaranteeing its future. In the first place, it is a small hospital, as state mental hospitals go. It is, in fact, of a size which is quite manageable, and let us pray that this never changes. Another advantage is its location. Not only is it placed in a lovely and attractive setting, but it is part of a particular kind of a community which offers substantial resources. The community is one of the oldest in the United States, with a long tradition of responsible community cooperation. The community is one which has pride in what it has and is therefore likely to take good care of what it has. Since the hospital is one of the things it has, it is highly likely that when the community is enlightened in ways it can serve the hospital, it will do so.

ALCOHOLISM AND THE LAW

The Alcoholic and Civil Law

THE REV. HARRY E. SHELLEY, LL B, TH B
Coordinator of Alcoholism Programs
Baltimore City Health Department

Our subject this evening is one that has both medical and legal implications and values. Alcoholism is a disease and, while there are many, many definitions of alcoholism and the alcoholic in the literature, all agree on at least one point and that is that alcoholism is characterized by the excessive use of alcoholic beverages. It is this excessive use of alcoholic beverages that frequently, quite frequently, brings the user into contact with the law.

In his book, "Liquor: The Servant of Man," Dr. Chafetz takes issue with the legal consequences of excessive use because he feels it is not a crime to be an alcoholic. If you have not read this delightful book, I certainly recommend it to you. You may recall the author acquired some notoriety a little while ago when he said we should teach our young people how to drink. Since that time we have heard all kinds of jokes about taking "Gin 102," "Martinis 305," and so forth, in school.

The chapter in Dr. Chavety's book of particular interest is entitled, "Is it a Crime to be Ill?" As you probably know, our law specifically states that "alcoholism is an illness and a public health problem, and the sufferer of alcoholism is recognized as one worthy of treatment and rehabilitation." This particular law has been on our statutes since 1960; it is Article 2C of the Annotated Code of Maryland; but, as my colleague, Mr. Embry, will no doubt point out later on, the same Code provides punishment for the alcoholic who manifests the symptom of his illness with public intoxication.

Many years ago, before there was a State of Maryland or a "great society" or even a country called the United States of America, the law had something to say about the excessive use of alcoholic beverages. Death by stoning was the prescribed penalty:

"If a man have a stubborn and rebellious son, which will not obey the voice of his father, or the voice of his mother, and that, when they have chastened him, will not hearken unto them: then shall his father and his mother lay hold on him, and bring him out unto the elders of his city, and unto the gate of his place; and they shall say unto the elders of his city, This our son is stubborn and rebellious, he will not obey our voice; he is a glutton and a drunkard. And all the men of his city shall stone him with stones, that he die: so shalt thou put evil away from among you; and all

Adapted from the two principal addresses in a panel discussion at the 168th Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland, April 27, 1966. "The Alcoholic and Civil Law" is followed by "The Alcoholic and Criminal Law" by Robert C. Embry, Jr., LL B.

Israel shall hear, and fear."

In case you doctors and lawyers do not know your Old Testament as well as I think you do, that is from the Book of Deuteronomy. Since the time when it was written we have progressed somewhat in our methods of dealing with alcoholics and problem drinkers, for we no longer stone them to death, though we still place many of them behind stones and bars. More about this from Mr. Embry, however.

My assignment this evening is to discuss with you procedures for admitting or committing alcoholics to treatment programs in our State hospitals. Physicians should be familiar with these laws for two reasons. First of all, alcoholism is a medical problem and more and more the family physician is being drawn in to cope with it. Second, in the light of a recent court decision that Mr. Embry will discuss, the alcoholic is now being regarded as a patient and not as a prisoner.

A very excellent pamphlet for every doctor, and I might add every lawyer, to have on his desk is the *Directory of Specialized Services for Alcoholics in Maryland,* which is published by the State of Maryland Department of Mental Hygiene. It is my understanding that a copy of this directory was sent to every physician in the State at the time of publication. If you do not have a copy, however, you may obtain one by contacting Mrs. Gertrude Nilsson, coordinator of the Department's Services to Alcoholics. Her office is in the State Office Building at 301 West Preston Street in Baltimore.

There are four State hospitals in Maryland, all of which have specialized Alcoholic Rehabilitation Units for *males.* Now, I emphasize the word *males* because unfortunately the poor females are discriminated against. This is a man's world. Crownsville is the only one of the four State hospitals with a special unit for women. When a woman alcoholic goes to any of the other three for treatment, she is not sent to a special unit, but is placed in the general hospital group.

It is hoped that some day all of our State hospitals will have facilities to treat women in their programs for alcoholics. At present a woman alcoholic who has been in one of the hospitals without a special ARU for women is likely to rebel against a return trip to that hospital. Nor can she go to Crownsville unless she lives in the right zone. Patients are admitted to a given hospital according to the county or, in the case of Baltimore City residents, the postal zone in which they live. Details are presented in the directory that I mentioned.

There are six ways to gain admission of the alcoholic in one of the special Alcoholic Rehabilitation Units. The Annotated Code spells out the procedures in legal language, but I shall use the examples that are given in the directory because they are clear, concise and to the point.

First, if you have a patient who admits to his alcoholism and wants treatment in the State hospital program, the procedure is very simple. Let us say, for example, that your patient lives in postal zone 18. A glance at the directory will tell you that all patients from zone 18 go to Springfield State Hospital in Sykesville, Maryland. As the physician, you would call the admission service of that hospital for an appointment for your patient and send him there along with a certificate requesting his admission. A certificate from you is not required for this type of admission, but it is certainly helpful in geting your patients into the hospital.

The patient admitted under these circumstances must spend at least seven days in the hospital *after* notifying the hospital superintendent, in writing, of his intention to leave, so that he has at least seven days in the ARU. May I point out, however, that it is the administrative policy of some of our State hospitals not to admit patients under this provision on weekends or after working hours, that is, on Saturdays, Sundays or any time before 8:30 AM or after 5:00 PM. My advice to alcoholics would therefore be to avoid getting sick during these off-hours because they will have trouble getting into a hospital. Maybe some day we can do something about admission procedures, but this is today's administrative policy.

The **second** classification of patients differs from the first in that the family recognizes a patient's alcoholism and seeks treatment for him even though he may not be ready to seek it himself. As a matter of fact, many of the so-called "voluntary admissions" in the first classification are not too voluntary. The patient may have a wife pushing him in the back or a boss threatening him a bit. It boils down to the fact that many admissions of the first type are really involuntary.

When the admission is *admittedly* involuntary and the patient is committed by a member of his

family, the procedure is identical to that for voluntary admission except for the requirement that two doctors sign a form stating that the patient is an alcoholic requiring hospitalization. Before new legislation was passed in 1960, an alcoholic for whom treatment in a State hospital was sought was admitted as an insane person. Now, however, he may be admitted as an alcoholic.

Third, alcoholics in a psychotic episode, and alcoholics whose primary diagnosis is schizophrenia or some other mental disease, are admitted with signed forms declaring that the patient is insane. In the case of an emergency, such a patient may be taken to the hospital without an appointment. A minimum of three days in the hospital is required after the patient has sent a written request for discharge to the superintendent.

I have never been able to figure out why it is seven days for the plain old alcoholic, but three for others. If, however, the hospital physician believes that the patient may be a danger to himself or to others, he may request a sanity hearing to lead either to the discharge or to the court commitment of the patient.

All of these provisions are found in Article 59 of the State Code, entitled "Lunatics and Insane." The title probably reflects the fact that the word alcoholic was not in common use when the Article was framed.

Commitments Under Equity

The next three provsions for commitment are in Article 16, entitled "Chancery." In law there are two different kinds of courts, the law court and the chancery, or equity, court. If there is no remedy of law, a person can go to a court of equity, where the judge can give a remedy if there is no writ available. Proceedings under equity involve such things as divorce and alimony—and also alcoholics.

The **fourth** of the six means of committing an alcoholic to a State hospital ARU is by filing a petition, under oath, to a court of equity (in Baltimore City, the Circuit Court) declaring that the person is an "habitual drunkard." According to the provisions of the article on Chancery, the court then has the authority to institute proceedings against such a person. The procedure is outlined in detail in the law and I shall describe it in brief, but I should like, first, to point out a few things about this particular Article.

The term *habitual drunkard* is defined as follows: ". . . the words 'habitual drunkard,' as used in this section, shall be construed to embrace any person who may be habitually addicted to the use of alcohol, opium, cocaine, morphine or any other intoxicant."

You can see that *habitual drunkard,* by definition, covers a very wide area: it includes not only the addicted user of alcohol, but also those who habitually use these other drugs and intoxicants. And this is not a criminal procedure—Mr. Embry will be talking about the criminal end of it. This is not a criminal procedure and yet some of the language used in the statute sounds very much like criminal law. As was pointed out so aptly in the report of the Maryland Commission on Alcoholism published several years ago, the term "habitual drunkard" sounds very similar to the term "habitual offender," which is used in the criminal section of the law.

Furthermore, in commencing a procedure under the provisions of Article 16, the court issues a warrant for the person's arrest, and usually when we think of being arrested we think of a crime.

It is interesting to note that, under this section of the law, the person who is alleged to be an "habitual drunkard," incapable of taking care of himself or his property, has a choice. On the one hand, he may voluntarily enter any institution selected by the court, in which case the legal proceedings against him are dispensed with, he enters the institution "for a limited time," and he may appoint his own "committee." This constitutes a **fifth** means of commitment.

On the other hand, and here we return to the fourth means, if he does not voluntarily submit to these proceedings, the court appoints a committee for him and, with the approval of the court, the committee has the power to confine him in any suitable institution for such length of time as the court may in its writing approve. In addition, the period of involuntary confinement may be extended by his committee with the written consent of the court "for such period as may be necessary for his complete reformation."

I often wonder if any alcoholic ever gets "reformed." It is more appropriate to speak of a recovered alcoholic.

So far we have discussed the chronic alcoholic, or the habitual drunkard, incapable of taking care

of himself or his property, who is willing to go to a State hospital for treatment, and the one who is not willing to go, but gets there nontheless. Article 16 of the Code covers both of these. A third provision of the Article presents the **sixth** basis for commitment and applies to the alcoholic charged with a criminal offense. The Code states, "When any person charged with the commission of a criminal offense is shown to the satisfaction of the judge before whom he is brought to be suffering from acute or chronic alcoholism . . . the said judge may commit him to one of the State hospitals for treatment and observation, under such terms and conditions as he may determine."

Like Articles 59 and 2C, Article 16 uses, but does not define, the term *alcoholism*. It thus gives power to a judge, a man trained in the law, to decide whether the accused is or is not an alcoholic, the victim of an illness. As I look at these provisions, several questions come to my mind. First of all, if the judge sitting in criminal court invokes the provision of this particular section of the law, are the criminal proceedings against the person alleged to be an alcoholic postponed until after the treatment period at the State hospital? And if they are terminated, what then? Secondly, if the criminal proceedings are continued after the invocation of the section and the defendant is found not guilty, can the alcoholic defendant then be confined under this provision of Article 16 or is it necessary to utilize another provision?

According to the *criminal* section of the law, an alcoholic may be classified as a criminal, although his only crime is a public display of a symptom of his illness, and he can be put in jail; moreover, if he comes in five times in one year and they want to use the habitual offender statute, he can be put into jail for six months. In contrast, under the provisions of this *equity* section of the law, a defendant who may be guilty of a crime of violence, such as rape or murder, may be sent to a State hospital for treatment and observation.

Thus even cursory study of the laws of the State of Maryland as they relate to the alcoholic (especially in the light of what has happened recently) makes it quite evident that there is need for serious and deep study and for alterations of our laws if there is to be uniformity in principle and philosophy in our Code.

Maryland is, of course, not alone in this jumbled maze of legal inconsistencies, but it seems to me that, with the assistance of dedicated members of the Bar, members of the medical profession, and others interested in the problem of alcoholism, Maryland can be a pioneer and a leader in an area that has been too long neglected. I should therefore like to leave you with these questions: As doctors, how do you feel about this legal maze? And, as lawyers, how do you need the help of the medical men to help you unjumble it?

The Alcoholic and Criminal Law

ROBERT C. EMBRY, JR.
of the Maryland Bar
Executive Secretary, Mayor's Task Force on Alcoholism

As we shift our focus from civil to criminal law, we must beware lest we allow our emotions to supersede our reason. This is an area of extreme sensitivity and wide ramifications that involves us not only as lawyers and doctors, but also as concerned citizens. Furthermore, it is an area susceptible to the dogmatism of various ideological presumptions and, if we are to make any progress in understanding the complex relationship between alcoholism and the criminal law, we must be willing to adopt a flexible approach unfettered by preconceived slogans.

The interaction between criminal law and alcoholism has not produced much of intellectual interest over the centuries. Today criminal law deals with alcoholism in two ways—first, and most directly, by prohibiting any person from appearing drunk in public. Persons violating this prohibition are guilty of a misdemeanor and subject to a fine

and a jail sentence.* An habitual offender may be fined $100 and sentenced to six months in jail and, as you have been told, one achieves this status by being arrested five times within a twelve-month period.

This law is plainly inequitable. The persons arrested and prosecuted under its provisions are, almost without exception, poor. A seemingly properous member of the community, when found drunk in public, is put in a cab or taken home by a police officer. Though the law makes no distinction between the alcoholic who is so sick that he cannot control his actions and the otherwise healthy person who has had too much to drink, there is a distinction in practice. Oddly enough, the distinction is to punish the sick man while either ignoring or helping the healthy one.

This incongruity is founded on the pervasive attitude that alcoholism is sinful and evil, a reaction intensified by the offensive appearance and demeanor of an alcoholic. The gay and boisterous drunk has been glorified and honored by our art and literature, while the chronic alcoholic has either been ignored or locked away in some dark place where he will not offend the sensibilities of his more fortunate peers.

The second area of interaction between alcoholism and criminal law is less susceptible of definition, but much more serious in its effect. This situation arises when alcohol incites the drinker to behavior that, in contrast to public drunkenness, should clearly be labeled as criminal, eg, robberies, murders and rapes.

A further distinction can be based on the fact that alcohol acts as both a direct and an indirect causative agent. The relationship is *direct* when a person commits a crime while under the influence of alcohol. It has been known for centuries, even by lawyers, that excessive consumption of alcohol is often the immediate cause of a criminal act. Excessive consumption leads to a rejection of scruples and a discard of self-restraint. A recent study has revealed that in 1959, 80% of the inmates of the New York penitentiary had a drinking problem.

The changing legal reaction to situations in which alcohol is the direct cause of a criminal act demonstrates the changing attitude of society towards drunkenness. At first, the punishment was increased if the crime was committed while the defendant was intoxicated, with the explanation that two crimes had been committed, the second being drunkenness. As society progressed, this approach was gradually softened, but drunkenness was still not permitted to be raised as a defense because, as Blackstone put it, "One crime should not be allowed to privilege another."

Throughout the 19th century, it was the predominant view that to permit drunkenness to operate as a defense would be to permit a criminal to escape liability by drinking heavily before he committed a premeditated crime. Toward the close of the century, the argument was made that, since the drinking of an alcoholic was involuntary, the act resulting therefrom was involuntary and under the common law one cannot be punished for an involuntary act. This argument was rejected by use of the fiction that all drinking was legally "voluntary" since even alcoholics had at one stage drunk voluntarily.

An advance was made near the close of the century when it was held that, because a crime, by definition, required the existence of criminal intent, the jury may—in deciding whether the necessary intent was present—consider the fact that the defendant was drunk when committing the criminal act. In spite of this concession, drunkenness must be extreme before it will affect the verdict. As a rule, the only result of a showing of drunkenness is a mitigation of the punishment.

I believe that these unsympathetic practices were the product of a compromise by the judge between the knowledge that a drunk strongly resembles someone who is mentally deranged and the belief that all drunks *voluntarily* assume their inebriated condition. As you in the medical profession tell the lawyers more about alcoholism, it increasingly becomes another aspect of the question of criminal responsibility.

More important than situations where alcohol is a *direct* cause, are those where it acts *indirectly,* or environmentally, to produce anti-social behavior in others. It has been repeatedly demonstrated that a pattern of delinquent behavior is usually determined by the first few years of one's life: by the time a child is eight years old, most of his personality has been formed. Criminals are usually not the children of criminals, but rather are

*Art 27, sec 123, Md Code Ann (1957)

found to come from certain environments—broken homes and/or homes with slovenly and indifferent, indulgent or overly repressive parents. The broken home is the most fertile source of criminal behavior and such a home is often the product of excessive drinking. Furthermore, alcoholic parents usually are slovenly and possess intense anti-social views. To these factors can be added the obvious one of reduced income and resulting poverty that can often be traced to alcoholism.

The relationship between criminal law and alcoholism is therefore threefold: alcoholism is a crime when evidenced in public; it directly causes many crimes of violence: and it contributes to the formation of an environment which produces criminal personalities.

Such, at least, has been the relationship until very recently. At the present time, alcoholism is no less a contributor, direct and indirect, to crime. No longer, however, is public evidence of alcoholism clearly a crime. In fact, in five of the 50 states, including Maryland, it is clearly *not* a crime. What has happened?

What has happened is that a man named Joe Driver, through his lawyers, had the audacity to demand that the law adopt a rational approach to the problems of alcoholism. As often occurs in the law, the single-mindedness of one man, convinced of the rightness of his cause, has worked a revolution.

Mr. Driver was arrested in Durham, North Carolina, in December, 1963, and charged with being drunk in public. He admitted the truth of the allegation and was sentenced to two years in jail. Aside from the severity of the sentence, this occurrence is hardly noteworthy because the same occurrence could be witnessed in any police court in the country.

Joe Driver was no stranger to the process. He was first arrested for public intoxication at the age of 24 and had been convicted of that offense more than 200 times since then. By the age of 59 he estimated that he had spent two-thirds of his adult life in jail as the direct result of alcohol. At his trial, although he admitted he had been drunk in public, he advised the court that he was a chronic alcoholic and asked that he be given medical treatment rather than a jail sentence. The request was ignored and the sentence was routinely announced. Ordinarily the matter would have ended there.

Joe Driver, however, was aware of a Supreme Court decision handed down the preceding year, which seemed to substantiate his claim that he could not be punished for public drunkenness. In that decision the Court reversed the state decision in the case of *Robinson vs California,* wherein Robinson was convicted under a statute that punished drug addiction. The reversal was based on a new doctrine.

As you know, our Constitution was amended before ratification by the addition of eleven provisions. In this so-called Bill of Rights there are protections against the federal government's interference with speech and religion, and there are guarantees of due process and jury trials. Shortly after the Civil War, these restrictions on governmental action were extended, by the 14th Amendment, to apply to the states as well as to the federal government. One of the original amendments, the Eighth, forbids the government's imposing any cruel and unusual punishment. In previous decisions this Amendment had been interpreted as prohibiting obviously cruel punishments, such as torture, or those greatly disproportionate to the crime, such as a fifteen-year sentence to hard labor for petty theft. The drug addict argued that the amendment also forbade the punishment of a sick man for being sick. The Supreme Court agreed.

To be successful in his defense it was necessary for Joe Driver to extend this new concept even further. The *Robinson* opinion made it unconstitutional to punish a condition, drug addiction, that medicine had described as a disease. While it was true that alcoholism is also a disease, Driver was not convicted for being an alcoholic. He was convicted for being drunk in public, the manifestation of a condition rather than the condition itself. Driver was not daunted by this difference. He argued that if North Carolina could not punish him for being an alcoholic, it could not punish him for a necessary product of that condition, such as public drunkenness.

The North Carolina Supreme Court rejected this argument in a brief opinion that contained no explanation of the court's reasoning. Up until recent times the matter would have ended at this point. Thirty years ago, however, it was decided that the federal courts, when petitioned for a Writ of Habeas Corpus, could call upon the state to

show that it was not holding a particular prisoner in violation of the protections set forth in the federal Constitution. Aware of this alternative, as are most persons who frequent our jails, Joe Driver petitioned the federal district court of North Carolina for such relief.

It might be noted here that this case offers a prime example of why our federal courts have ruled on so many matters which were formally the concern of the states. When Joe Driver presented his unique argument to the North Carolina state court it was disposed of in a short paragraph, with no attempt made to confront the very serious issue raised by the appellant. State courts have continually refused to concern themselves with the affronts to human dignity often found in our criminal law. As a result the federal courts, after continuous state procrastination, have been forced to fill the vacuum. While the preservation of strong state governments is important, of greater import is the need to prevent undue public imposition on any citizen. As with many other public problems, when state governments assume their proper responsibility the power they have lost to the federal government over the last three decades will return to its original and most efficient repository.

Let us get back to Joe Driver, however. His argument was accepted by the Federal Court of Appeals for the Fourth Circuit, which includes Maryland as well as North Carolina. For the first time in recorded history a court ruled that an alcoholic could not be punished for public intoxication. As you can well imagine, this decision has raised as many questions as it has answered.

In the limited area of alcoholism, the grounds of the decision are somewhat misleading. It is not the placing of a destitute alcoholic in jail that is cruel, for there he receives shelter, food and some medical attention. What is cruel is that our rich society allows this person to continue to degenerate without doing anything to delay the process. It is not enough then to leave the alcoholic on the street, for this is the really cruel possibility. Fortunately, the jail and the street are not the only alternatives. We must fashion some positive program which will break the circle of despair and enable these miserable people to regain their self-respect. The particulars of such a program have yet to be developed and its formulation promises to be one of the most complex and frustrating tasks imaginable, yet it must be undertaken. Neither law nor medicine has the answer, and it is unlikely that either will find it alone, but I am confident that an alliance of the two disciplines can work wonders.

The implications of the *Driver* decision are important to us not only as lawyers and doctors, but as citizens who should be aware of, and participating in, what promises to be a revolutionary change in our society's laws. Fundamental decisions must be made about our philosophical and legal assumptions. This task must not be left to lawyers.

The particular assumption challenged in this case is that of free will. If reduced to its basic elements, and if some glaring exceptions are summarily ignored, Anglo-American law establishes as a prerequisite to criminal liability that there be both an act and a conscious state of mind. This state of mind is called *mens rea*, or a guilty mind. This mental state is required because we have assumed that man makes a free choice when he acts and if that act is socially undesirable, the man is deserving of punishment.

The *Driver* opinion focused on the retributive and deterrent aspects of criminal law, the most primitive justifications. Because retribution in the case of an involuntary act was viewed as unfair, and deterrence as impossible, punishment of the publicly drunk alcoholic was forbidden. This reasoning leads to two observations.

First, imprisonment can no longer be justified on the grounds of either isolation or reformation, the other two conceivable justifications. It had been previously thought that either was sufficient to warrant incarceration. An alcoholic can no longer be jailed just because he is deemed repulsive or dangerous, or just because someone believes he should be cured of an illness. Alcoholics can no longer be dealt with by an institution that assesses moral guilt; their treatment cannot involve the criminal courts. This result might not be applauded when we sit down to think about how the machinery is to be set up to get alcoholics off the street and into a program that offers some hope of success.

The **second** observation is that other areas of the law are subject to a much needed reappraisal. To begin with, how should the courts dispose of a case where the defendant is an alcoholic accused of drunken driving? If you answer that the alco-

holic was not compelled by his sickness to drive while inebriated, remember that Joe Driver was not compelled to be in public when he was "under the influence." The fact is that once an alcoholic begins to drink, an act which is involuntary, he no longer is conscious of what he is doing, with the result that any subsequent action is to some degree the product of his sickness and something for which he arguably may not be held morally responsible. Consider further the alcoholic who steals to obtain money to buy a drink. I think you can see how difficult it is to draw the line where criminal liability begins.

Analogous questions arise in other areas where an admitted illness gives rise to socially undesirable acts. Might not this opinion be read as requiring us to re-examine our barbaric and narrow-minded attitudes toward homosexuality? But if we do so, are we prepared to excuse a homosexual who perpetrates vulgar public displays? Again, what about the narcotic addict who in order to service his needs sells dope to others? These ramifications are being explored. Recently, a gentleman in Washington, indicted for passing bad checks, pleaded that he did it to obtain money to buy liquor to service his alcoholism. Though no decision has yet been reached, it is noteworthy that the defense was not rejected out of hand.

The line of analysis may be further extended. The Director of the Federal Bureau of Prisons recently predicted that in ten years the war on poverty would reduce our prison population by 50%. Put another way, his position is that there are certain conditions external to man that destroy his free will and bring about criminal acts. This idea is not new, of course, but its implications have never been honestly confronted. Recently, Sheldon Glueck, at Harvard Law School, isolated five environmental factors that could be used to pinpoint those children who would commit a serious crime before reaching adulthood. Predictions based on these factors had proved accurate in nine out of ten cases. This indicates that all criminal activity is to some degree as involuntary as the public drunkenness of an alcoholic. It also indicates a crueler irony than exists with respect to alcoholism: unlike the latter illness, which may be caused by a person's physical or mental makeup, the environment-oriented illness that produces most other crimes is in large part caused by the same insensitive society that later seeks to punish the product of the illness. How then can the law, how then can we as citizens, answer the lawbreaker who cries that it was known, or could have been known, at the time he was five years old that he would commit a crime, when we have done nothing about it? The answer of an earlier age would have been that they had neither the knowledge to make such a prediction nor the resources to correct the harmful environment. Neither of these answers may be honestly given today.

A warning must be raised against proceeding too rapidly with a brave-new-world approach that turns all persons who commit anti-social acts over to members of your profession, there to remain until they are medically determined to be no longer dangerous. The average offender would much rather suffer a definite prison sentence than indefinite commitment to a medical institution. I think the danger implicit in shoving the complete responsibility in this area on your shoulders is readily apparent.

In pointing out the potential ramifications of the *Driver* decision, I do not mean to comment on their validity. Rather my desire is only to indicate that we are entering a difficult but exciting period. As noted by Chief Justice Warren in his recent speech at the University of Maryland Law School, our society is now at the stage where it can afford to do some fresh rethinking of our assumptions in the area of criminal responsibility. In doing so, however, we must have the courage and commitment to meet the challenges of the answers. Such a challenge is exemplified by the alcoholic. Now he can no longer be jailed—an advance, no doubt. But have we really progressed if he is returned to the streets uncured because there is no non-penal facility that will take him and there is no medical program that offers a possibility of rehabilitation and cure?

May I close with the personal observation that, no matter how vexing the complications of this new trend in the law prove to be, they must be confronted and overcome if we are to continue to progress toward that society to which we have committed ourselves in the oaths of our respective professions.

COXSACKIE VIRUS GROUP A, TYPE 7 INFECTION IN MARYLAND

STUART H. WALKER, MD
YASUSHI TOGO, MD
MARGARET M. KEEFER

Coxsackie virus Group A, Type 7 has been demonstrated to produce distinctive neuronal damage in man and monkeys.[1, 2] Attention was called to this property by Russian workers who isolated this agent from patients in an outbreak of clinical paralytic poliomyelitis in 1950.[3] It has since been isolated from patients with lower motor neuron disease in the United States[4, 5] and Scotland.[6] The histological appearance of the disease produced in monkeys by this agent resembles mild paralytic poliomyelitis, but is characterized by involvement of the corpus striatum and the temporal and occipital lobes of the cerebral cortex which are rarely, if ever, involved in poliovirus infection.[7, 8] Because of these unusual features the isolation of Coxsackie virus Group A, Type 7 in Maryland warrants this report.

Report of Case

An eight-year-old white boy entered Mercy Hospital, Baltimore, on June 23, 1964, because of headache and back pain for one day. Two days prior to entry he was less active and complained of slight headache. Nuchal rigidity, positive Kernig's and Brudzinski's signs, tachypnea, hyperactive right patellar reflex response, and a temperature of 102.6 F (39.2 C), were detected at the time of entry. The clear spinal fluid revealed 182 white cells per cu mm (100% lymphocytes) with a total protein concentration of 54 mg and a sugar concentration of 58 mg per 100 ml and chloride concentration of 118 mEq per liter. Examination of the blood revealed a white cell count of 8,450 per cu mm, with 65% neutrophils, 33% lymphocytes and 2% monocytes. No organisms were isolated from blood or spinal fluid obtained at this time, the urine was normal, a slide agglutination test for Leptospira was negative and radiographic examination of the chest revealed no abnormalities.

On the day after entry, headache was much decreased and nuchal rigidity was much less. The temperature continued at approximately 101 F to 102 F (38.3 C to 39.4 C) until the third hospital day by which time all signs and symptoms of meningeal irritation had disappeared. The transient alteration in right patellar reflex response disappeared on the second hospital day and no other focal neurological abnormalities were detected. The patient was discharged from the hospital six days after entry and no residual neurological deficits have been subsequently detected.

Comment

Throat swab and rectal swab specimens were collected shortly after admission and brought to the Division of Infectious Diseases, University of Maryland School of Medicine. The specimens were inoculated into several tissue culture systems and litters of one-day old suckling mice, for virus isolation attempts. Rectal swab specimens yielded classical flaccid hindleg paralysis of suckling mice in seven days and subsequent passages of the carcass suspension regularly produced the same

From the Department of Pediatrics, Mercy Hospital, and the Section of Infectious Diseases, Department of Medicine, University of Maryland School of Medicine.

disease. The third passage material was employed for identification which was carried out by the neutralization technique using type-specific Group A Coxsackie virus antisera. The isolate was identified as Coxsackie virus Group A, Type 7.* The throat swab specimen did not yield virus. Virus isolation attempts in tissue culture systems were all negative. Neutralizing antibody titers in acute phase serum (obtained on the second day of disease) and late convalescent serum (4½ months after the onset of the disease) against 100LD50 of the patient's infecting virus were 1:40 and 1:160, respectively.

Summary

A laboratory-confirmed infection by Coxsackie virus Group A, Type 7 producing the clinical picture of aseptic meningitis is presented. The recognition of infection with this agent is important since its neurotropic behavior seems to lie between the other Coxsackie viruses and the polioviruses. It is capable of producing mild to moderate paralytic poliomyelitis and may account for an increasing proportion of patients with this diagnosis in areas where the population is well protected against poliovirus infection.

*This finding was confirmed at the Communicable Disease Center, Atlanta, Georgia.

SEVERE PULMONARY EDEMA AND CONGESTION FOLLOWING THORACENTESIS IN A PATIENT WITH SEVERE AORTIC STENOSIS

CONSTANTINOS DRITSAS, MD,
C. THOMAS FLOTTE, MD

Removal of fluid from body cavities is not always an innocent procedure. Collapse due to sudden sodium depletion following abdominal paracentesis has been reported, and thoracentesis has at times been attended by such systemic symptoms as circulatory collapse and pulmonary edema.

Therapeutic misadventures of this type probably occur more often than they appear in the literature. Within the last six years only one case of acute pulmonary edema subsequent to thoracentesis was found.[1]

From the Department of Surgery, University of Maryland School of Medicine, and Maryland General Hospital, Baltimore, Maryland.

Report of Case

LKL, a 71-year-old white woman known to have had hypertension and "rheumatic heart" for many years, was admitted to the Maryland General Hospital with the chief complaint of shortness of breath. During the six months prior to admission she had had episodes of dyspnea and ankle

edema. The dyspnea was at first exertional, becoming progressively worse until two days before admission at which time she was dyspneic even at rest. She had had bouts of angina pectoris for many years. On admission the patient was dyspneic. The blood pressure was 140/90, pulse 160, repirations 35, temperature 101 F (38.3 C). The breath sounds were diminished at both bases and there was clinical evidence of bilateral hydrothorax. The heart was enlarged to the left and a grade III systolic murmur was heard in the aortic area with radiation to the neck. An apical systolic murmur was present. The liver was felt three fingerbreadths below the right costal margin. The EKG showed supraventricular tachycardia with left ventricular hypertrophy and strain. The patient was placed in an oxygen tent and treated with mercurial diuretics, morphine sulfate 10 mg and phenobarbital 15 mg. Two hours following admission, a thoracentesis was done on the left side, with removal of 1000 cc of clear fluid. Immediately thereafter the patient went into acute pulmonary edema and expired approximately one and a half hours following the thoracentesis.

The principal findings on post mortem examination were related to the heart and lungs. The lungs showed severe edema and congestion. The congestion was especially pronounced in the left lung, which weighed 475 gm; the right lung weighed 375 gm and showed moderate edema. The left ventricle showed hypertrophy of the prestenotic type. The aortic valve was stenotic due to marked calcific sclerosis with calcium deposits in the sinuses of Valsava, which were actually filled (Fig 1). The mitral cusps also showed sclerosis, involving the ventricular surface. The coronary vessels showed minimal arteriosclerotic changes. The anterior descending and right coronary arteries were very small in size. Microscopic examination of sections from the lungs revealed extensive edema and congestion, and large areas of actual hemorrhage into the alveolar spaces especially severe in the left lung (Fig 2).

Comment

The rapid sequence of events, supported by the pathologic evidence in this case, suggests a cause and effect relationship between the thoracentesis and the subsequent acute pulmonary edema.

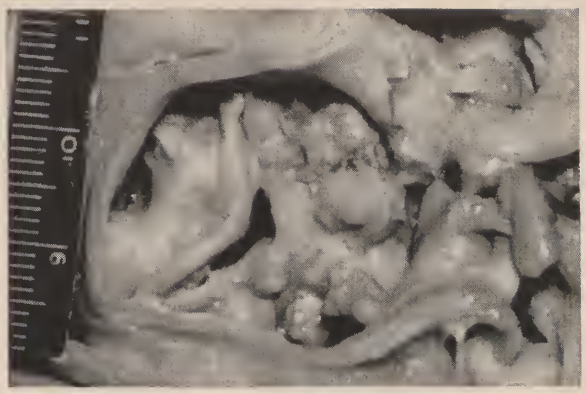

Fig 1
Aortic valve—extraventricular view
(Note the severe stenosis with calcification of the leaflets.)

It has been estimated that the blood volume in the pulmonary capillaries should be 75 cc at rest and up to about 100 cc during exercise. This increase is the result of increased output of the right ventricle. Obviously it is the response of the left ventricle, which increases its output, that prevents pulmonary congestion. It is conceivable that removal of 1000 cc of fluid from the thoracic cavity should have resulted in an increase of the pulmonary capillary blood volume by two mechanisms:

(1) Increase of the right ventricular output (active mechanism).

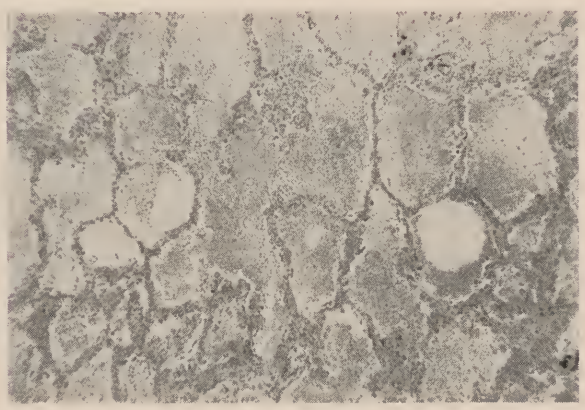

Fig 2
High power photomicrograph showing pulmonary edema and congestion
(Note the intra-alveolar hemorrhage.)

(2) Expansion of the pulmonary capillaries, now under the continuous strain of the negative intrathoracic pressure (passive mechanism).

The balance in the cardiopulmonary system is thrown off at this point, and it is now up to the left ventricle to make the pertinent corrections. The only way by which the left ventricle can accomplish this is by increasing its output. It is, however, both experimentally and clinically established that a heart with aortic stenosis shows a very slow or no response (depending on the degree of stenosis) in situations in which demands upon it are increased. The most important disturbances of the circulation in aortic stenosis are related to (a) slow emptying of the left ventricle, (b) inability of the left ventricle to increase its output quickly, (c) inadequacy of coronary blood flow. Left ventricular output is relatively fixed in severe aortic stenosis and stroke output rarely rises with exercise. The left ventricular pressure may exceed 250 mm/Hg during isometric contraction; this and the prolongation of the systolic phase interfere with coronary blood flow, with further limitation on the ability of the left ventricle to increase its work.

The case presented may be compared with cases of sudden pulmonary edema developed on the operating table during pericardiolysis for constrictive pericarditis, when the procedure is inadvertently started over the right ventricle.

Summary

A case is reported of fatal pulmonary edema and congestion, following thoracentesis in a patient with severe aortic stenosis and chronic heart failure. Evacuating thoracentesis in patients with aortic stenosis should be undertaken with caution. To provide time for adjustment, small amounts should be removed at intervals. Rotating tourniquets to trap blood temporarily in the periphery, beginning simultaneously with thoracentesis and gradually discontinued after the thoracentesis has ended, may be protective. Acute pulmonary edema and congestion will not, as a rule, develop in all cases with aortic stenosis undergoing thoracentesis. Degree of stenosis, grade of cardiac reserve, and adequacy of coronary blood flow are determining factors in a way that makes the case unpredictable. The possibility of therapeutic misadventure, however, should be borne in mind, and caution should be exercised in all cases.

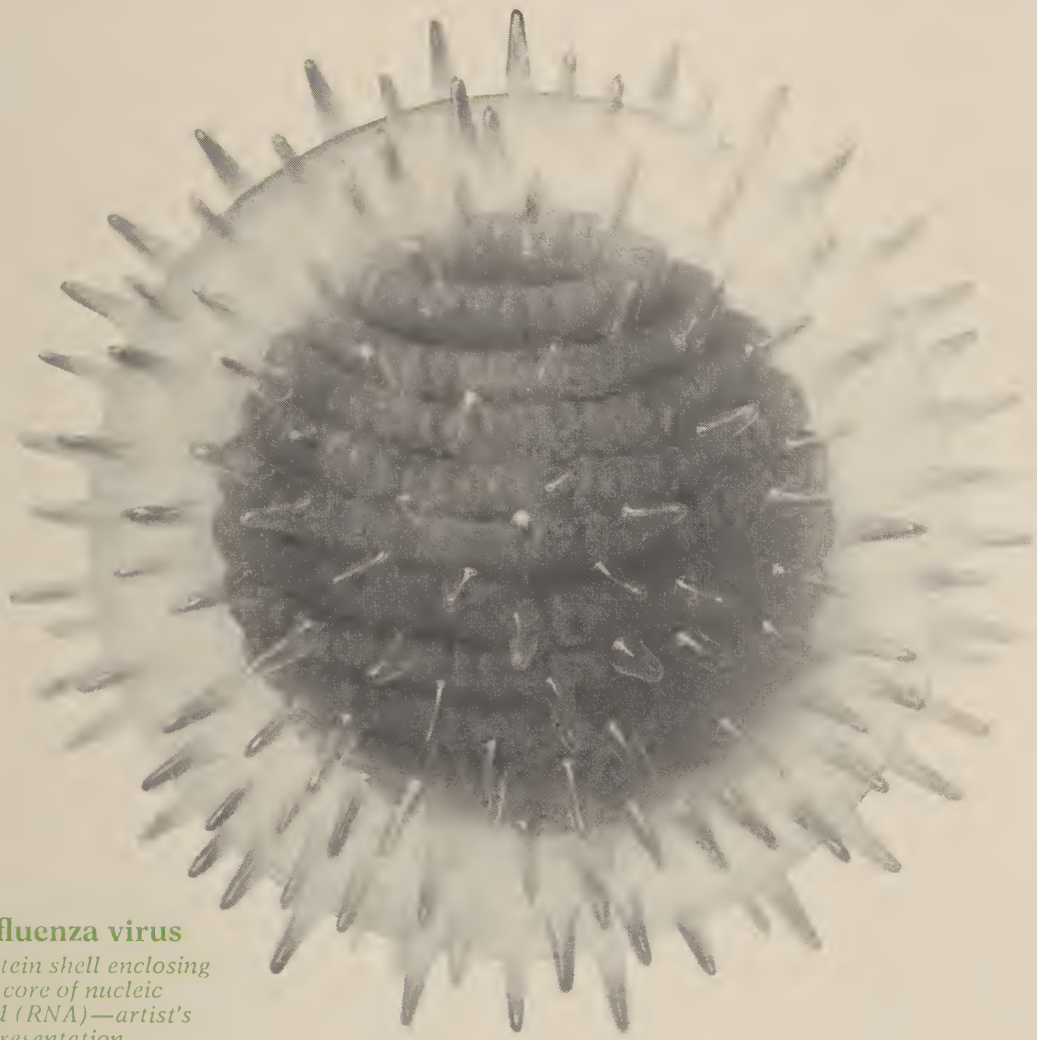
STUDY OF INFORMATION-GATHERING PATTERNS

A comprehensive study directed toward identifying ways in which medical scientists seek information in their own working environments is one of several projects in information science receiving Public Health Service support, according to Marjorie P. Wilson, MD, associate director for Extramural Programs of the Public Health Service's National Library of Medicine.

The study, for which the National Library of Medicine has made a grant of $38,653 to Northwestern University, is entitled "Experiments on Information Environments of Researchers." Principal investigator is Albert H. Rubenstein, PhD, professor of industrial engineering and management sciences.

The project is aimed also at determining scientists' information needs and matching those needs to a comprehensive range of information services; measuring the impact of new information services; and comparing the information-gathering patterns of several biomedical disciplines.



Public Health Service news release, Dec, 1966.

New from Du Pont

Symmetrel®

(Amantadine HCl)

The first oral chemical virostat for the prevention of influenza A_2

Influenza virus
Protein shell enclosing the core of nucleic acid (RNA)—artist's representation

The incidence of influenza A_2. In this country, where influenza is one of the leading causes of morbidity, influenza A_2 (Asian) continues to be a serious medical problem. In 1957 influenza A_2 was responsible for approximately 40,000 excess deaths in a three-month period. Since that year the most prevalent influenza virus has been A_2 (Asian).

What is Symmetrel®? "Symmetrel" (amantadine HCl) is a new synthetic chemical which acts as a molecular barrier to virus penetration. It provides for the first time specific oral medication for the prevention of respiratory infections caused by influenza A_2 (Asian) viruses—an entirely new approach in preventive medicine.

For prescribing information, see last page of this presentation

What Symmetrel® (amantadine HCl) means to you

...the first and only oral chemical agent to prevent influenza A_2 (Asian).

...not a vaccine or antibiotic, but a new synthetic chemical unrelated to any other chemotherapeutic agent.

...unique mode of action: prevents virus penetration of the host cell without affecting vital cell functions.

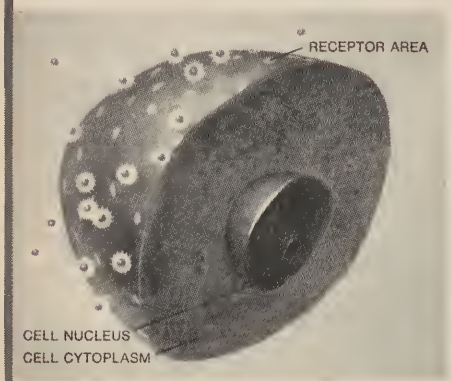
...specifically active against all influenza A_2 viruses tested to date.

...not indicated for the prevention of influenzal or respiratory illness other than influenza A_2 or for the treatment of established disease.

...does not interfere with normal antibody response; acts in concert with pre-existing antibody.

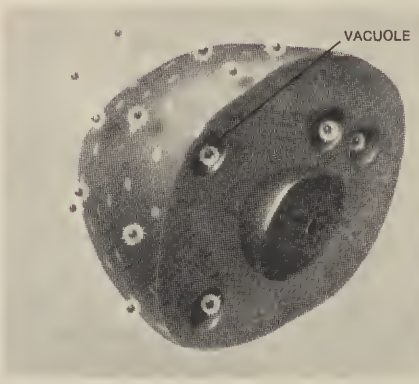
What Symmetrel® means to your patient

...possible immediate influenza A_2 protection when taken following suspected contact.



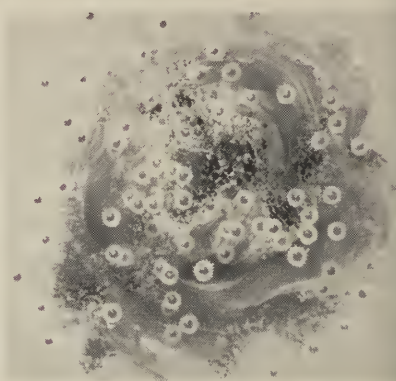
...may be particularly useful during outbreaks or epidemics and for high-risk patients in whom the occurrence of influenza A_2 is especially hazardous.

...a high degree of safety in clinical use.



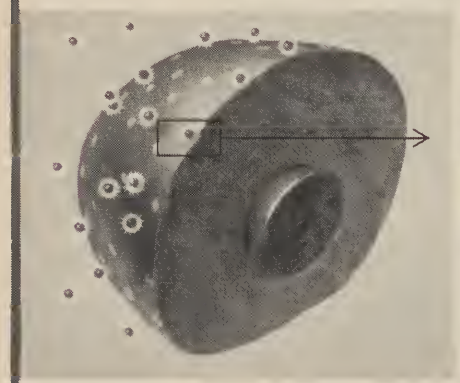
...simple once daily or b.i.d. dosage.

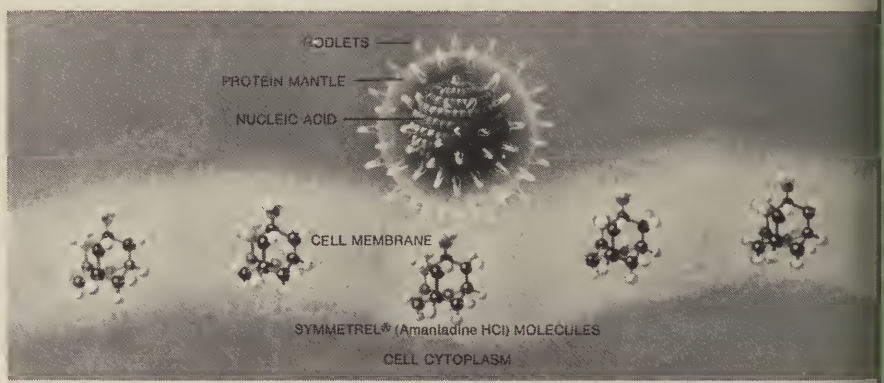
The mode of action of Symmetrel®



How the influenza virus invades and destroys the untreated cell

1 Viruses outside the cell attach themselves to specific cell receptor areas





2 The virus is incorporated into a vacuole within the cell. From this vacuole the virus nucleic acid passes into the cell cytoplasm

3 The virus nucleic acid then directs the cell to produce both new virus nucleic acid and virus protein coat material which aggregate to form new virus particles. This process leads to the release of new virus particles and eventual destruction of the cell

How Symmetrel® (Amantadine HCl) prevents virus invasion[1]

Our current knowledge leads us to believe "Symmetrel" acts as a molecular barrier to influenza virus penetration. Shown here in a greatly enlarged section, "Symmetrel"—located at the cellular membrane—effectively prevents (blocks) virus penetration. Thus, "Symmetrel" does not directly destroy the virus particle but acting as a virostat prevents the cycle of virus penetration, virus replication, and cell destruction that is characteristic of virus invasion of animal cells (tissue). *Artist's conception based on current scientific knowledge.*

1. "Mode of Action of the Antiviral Activity of Amantadine in Tissue Culture", Hoffmann, C. E.; Neumayer, E. M.; Haff, R. F.; and Goldsby, R. A., Journal of Bacteriology *90*,623 (1965).

afety of Symmetrel® Confirmed. When used as indicated, is generally well tolerated. No kidney, ver, bone marrow, or hematological disturbances have been observed.

rescribing Information

ndications: "Symmetrel" is indicated for the preven- on (prophylaxis) of influenza A_2 in persons of all age oups. Early use is recommended, preferably before as soon as possible after actual or suspected con- ct with individuals suffering from influenza A_2. Symmetrel" should especially be considered for gh influenza-risk patient groups such as those suf- ring from chronic debilitating diseases and elderly rsons.

ontraindications: Not indicated for the prevention influenzal or respiratory illness other than influ- za A_2 or for the treatment of established disease.

arnings: Administration to patients with central rvous system disease, particularly geriatric patients th cerebral arteriosclerosis, and patients with a story of epilepsy or other "seizures," requires strict bservation for possible untoward effects (see Ad- rse Reactions). Patients taking psychopharmaco- gic drugs, central nervous system stimulants, or coholic beverages should be observed for possible idence of intolerance. Those patients who experi- ce central nervous system effects or blurring of sion should be cautioned against driving or working situations where alertness is important.

No teratogenic effects have been seen in reproduc- e studies in rats and rabbits. Studies in pregnant omen have, however, not been done and use of this ug in women of childbearing age should be under- ken only after weighing the possible risks to the tus against benefit to the pregnant patient. It should t be administered to nursing mothers since it is not own whether the drug is secreted in the milk.

ecautions: Ineffective against bacterial infections. tients should be observed for idiosyncratic reac- ns as with all new drugs. Geriatric patients with e-existing serious medical illnesses with mental or ysical deterioration should be followed carefully edically while taking "Symmetrel." (See Adverse actions.)

verse Reactions: With higher than indicated doses anifestations of central nervous system effects such as nervousness, insomnia, dizziness, lightheadedness, drunken feeling, slurred speech, ataxia, inability to concentrate and some psychic reactions including depression and feelings of detachment were seen. Occasional blurred vision was reported at higher doses. Some of the milder and less pronounced symptoms above have been reported in a small number of patients taking the recommended dosage of 200 mg per day. Those were mostly transient and disappeared with continued administration of the drug. Some geriatric patients developed paranoid or hallucinatory behavior and became unmanageable while taking 200 mg daily. Medically unselected seriously deteriorated geriatric patients showed poor clinical tolerance after several weeks of daily dosing with 200 mg per day. One elderly patient with a history of prior cerebrovascular accident developed visual hallucinations and grand-mal convulsions while on drug at 800 mg per day. Some cases of dry mouth, gastrointestinal upset and skin rash and rarely, tremors, anorexia, pollakiuria, and nocturia have been also reported.

Safety: When used as indicated, is generally well tolerated. No kidney, liver, bone marrow, or hematological disturbances have been observed.

Dosage: *Adults:* Two 100 mg capsules (or 4 teaspoonfuls of syrup) as a single daily dose or the daily dose may be divided into one capsule of 100 mg (or 2 teaspoonfuls of syrup) twice a day.

Children: 1 yr.—9 yrs. of age: Calculate total daily dose on the basis of 2 mg to 4 mg per pound of body weight per day (but not to exceed 150 mg per day). Daily dose, given as the syrup, should be given in 2 or 3 equal portions.

9 yrs.—12 yrs. of age: Total daily dose 200 mg given as one capsule of 100 mg (or 2 teaspoonfuls of syrup) twice a day.

How Supplied: *Capsules:* Bottles of 100. Each red, gelatin capsule contains 100 mg amantadine HCl.
Syrup: Bottles of 1 pint. Each 5 ml (1 teaspoonful) contains 50 mg amantadine HCl.

LOMOTIL®

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride ..... 2.5 mg.
(Warning: May be habit forming)
atropine sulfate ..... 0.025 mg.

Effectiveness: Lomotil possesses a unique degree of effectiveness in both acute and chronic diarrhea.

Convenience: Lomotil is supplied as small, easily carried, easily swallowed tablets and as a pleasant, fruit-flavored liquid.

Versatility: The therapeutic efficiency, safety and convenience of Lomotil may be used to advantage alone or as adjunctive therapy in diarrhea associated with:

- **Ulcerative colitis**
- **Acute infections**
- **Irritable bowel**
- **Regional enteritis**
- **Drug therapy**
- **Food Poisoning**
- **Functional hypermotility**
- **Malabsorption syndrome**
- **Ileostomy**
- **Gastroenteritis and colitis**

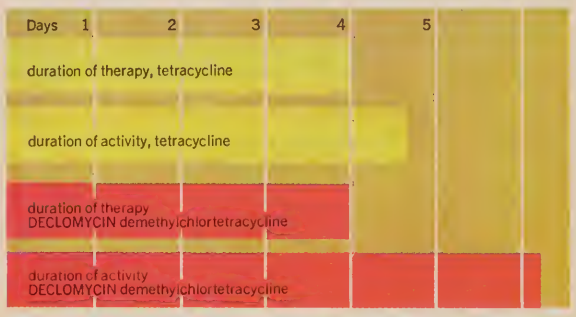
Dosage: For correct therapeutic effect—Rx correct therapeutic dosage. The recommended initial daily dosages, given in divided doses, until diarrhea is controlled, are:

Children: Age	Total Daily Lomotil Dosage	Lomotil Liquid Dosage (Each teaspoonful [4 cc.] contains 2 mg. of diphenoxylate HCl)
3-6 months	3 mg.	½ tsp. 3 times daily
6-12 months	4 mg.	½ tsp. 4 times daily
1-2 years	5 mg.	½ tsp. 5 times daily
2-5 years	6 mg.	1 tsp. 3 times daily
5-8 years	8 mg.	1 tsp. 4 times daily
8-12 years	10 mg.	1 tsp. 5 times daily

Adults: 20 mg. (2 tsp. 5 times daily or 2 tablets 4 times daily) Based on 4 cc. per teaspoonful. Maintenance dosage may be as low as one-fourth the initial daily dose.

Precautions: Lomotil, brand of diphenoxylate hydrochloride with atropine sulfate, is a Federally exempt narcotic preparation of very low addictive potential. Recommended dosages should not be exceeded. Lomotil should be kept out of reach of children since accidental overdosage may cause severe respiratory depression. Lomotil should be used with caution in patients with impaired liver function and in patients taking addicting drugs or barbiturates. The subtherapeutic amount of atropine is added to discourage deliberate overdosage.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.



SEARLE *Research in the Service of Medicine*

why wonder about a drug

when you know

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

produces 1-2 "extra" days' activity

1-2 "extra" days' activity
after the last dose to protect against relapse

one 300 mg tablet b.i.d.
or
one 150 mg capsule q.i.d.

Effective in a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.

Contraindication—History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort.

Precautions and Side Effects—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York

For he's a jolly good fellow

But what does he think?

Many overweight patients can benefit from the appetite control provided by the sustained anorexigenic-tranquilizing action of BAMADEX SEQUELS: anorexigenic action of amphetamine; tranquilizing action of meprobamate; prolonged action through sustained release of active ingredients.

Bamadex® Sequels®

DEXTRO-AMPHETAMINE SULFATE (15 mg.) WITH MEPROBAMATE (300 mg.) SUSTAINED RELEASE CAPSULES

to help establish a new dietary pattern

Contraindications: Dextro-amphetamine sulfate: in hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncrotic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

COMPONENT MEDICAL SOCIETIES

FREDERICK COUNTY

The Frederick County Medical Society held its annual elections on December 20, 1966, at the Hotel Frederick. The following were elected to office for 1967:

President: **Richard L. Fruth, MD**
President Elect: **Rex Martin, MD**
Secretary: **Robert J. Thomas, MD**
Treasurer: **Richard C. Reynolds, MD**
Executive Committee Member (for 3-year term): **Frank Damazo, MD**
Delegates: **T. D. Reid, MD**
Charles Wright, MD
Alternates: **Robert J. Thomas, MD**
John Teske, MD

Robert S. Turner, MD

MONTGOMERY COUNTY

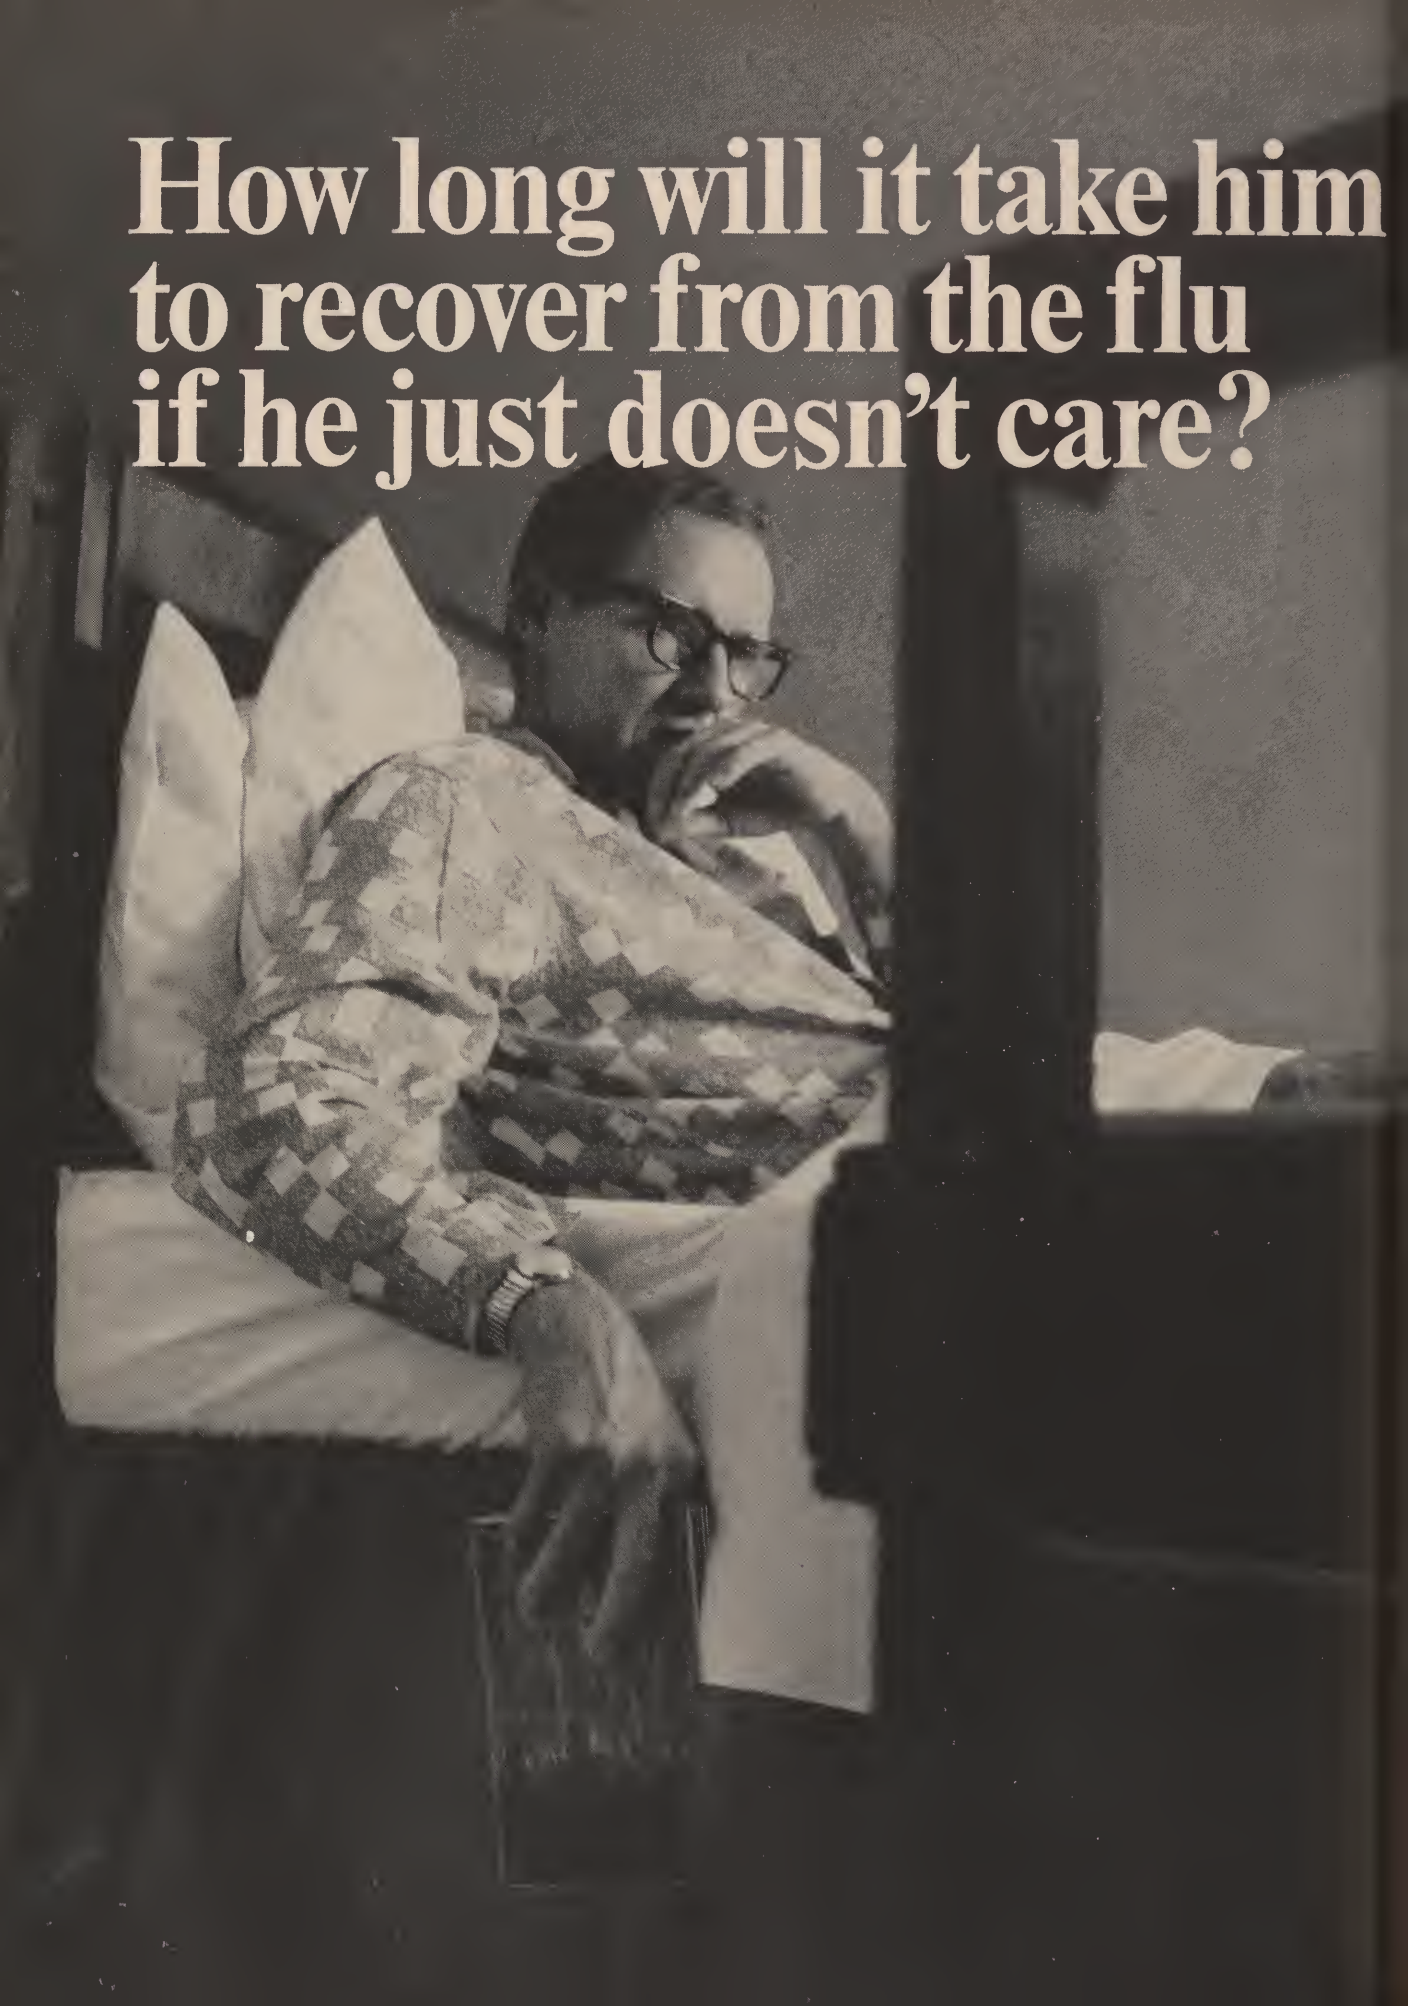
John O. Robben, MD, president of the Montgomery County Medical Society, has announced the society's participation, under contract with the US Public Health Service, in a new study of the use of nursing homes as Extended Care Facilities under the Medicare Act.

The society's two-fold task in this project is to coordinate activities involved in the flow of patients from hospital to Extended Care Facility to nursing home (and/or, if developments permit, to the patient's home) and to make continuing utilization reviews of the Extended Care Facilities in the County. A coordinator has been employed to maintain control records of patient flow, and Utilization Review Committees are being formed to review both individual long-term patients and the Facilities providing care and services.

George Sharpe, MD
Chairman, Medicare Coordinating Committee

WASHINGTON COUNTY

The Washington County Medical Society met at the Venice Restaurant on Thursday, January 19, 1967. Despite a snowy beginning, the weather behaved and we had an excellent turnout. The scientific portion of the meeting was conducted by **Robert J. Hall, MD,** a colonel in the Army Medical Corps and presently chief of cardiology at Walter Reed Hospital. His topic was "Deceptions in Cardiology."



* * * * *

Members of the Executive Committee of the Washington County Medical Society, and members of the society's Public Health and Legislation Committee, met on January 12 with State Senator George Snyder, the Delegates from Washington County, and **John Sargeant,** executive secretary of the Medical and Chirurgical Faculty. During lunch a very informal discussion took place between the physicians and legislators, with Mr. Sargeant supplying pertinent information from the Faculty office. Each group seemed to enjoy the opportunity to meet the other group and both were well represented. Senator Snyder stressed the fact that it was important for physicians to be aware of what is going on, and to be willing to exchange ideas with their representatives.

* * * * *

Richard T. Binford, MD, has now assumed the presidency of our county medical society and has been busy naming committee chairmen and getting things under way for the coming year. Our best wishes to him for a good year in office.

John W. Clark, MD
Secretary

How long will it take him
to recover from the flu
if he just doesn't care?

Does he really care? Is he alert, encouraged, positive and optimistic about getting out of bed and back to work soon?

Or is he giving in to the depressing impact of confinement?

When functional fatigue complicates convalescence, Alertonic can help...

Pleasant-tasting Alertonic is pipradrol hydrochloride—an effective cerebral stimulant whose gentle analeptic action helps counteract the apathy and inertia that so often delay convalescence—together with an excellent vitamin and mineral formula, in a satisfying 15% alcohol vehicle.

Nothing fosters confidence and a sense of well-being better than your own personal warmth, understanding and encouragement together with Alertonic to help insure prompt response.

Adequate dosage is important: Prescribe Alertonic—one tablespoonful t.i.d., 30 minutes before meals...tastes best chilled.

And for your patient's sake, prescribe Alertonic in the convenient, economical one-pint bottle.

Alertonic®

Available Only On Prescription

Each 45 cc. (3 tablespoonfuls) contains: alcohol, 15%; pipradrol hydrochloride, 2 mg.; thiamine hydrochloride (vitamin B_1) (10 MDR*), 10 mg.; riboflavin (vitamin B_2) (4 MDR), 5 mg.; pyridoxine hydrochloride (vitamin B_6), 1 mg.; niacinamide (5 MDR), 50 mg.; choline,† 100 mg.; inositol,† 100 mg.; calcium glycerophosphate, 100 mg. (supplies 2% MDR for calcium and for phosphorus) and 1 mg. each of the following: cobalt (as chloride), manganese (as sulfate), magnesium (as acetate), zinc (as acetate), and molybdenum (as ammonium molybdate).

*Multiple of adult Minimum Daily Requirement supplied.
†The need for these substances in human nutrition has not been established.

Indications: 1. Functional fatigue such as that often associated with: a depressing life experience or stressful time of life; advancing years; convalescence; limited activity or confinement. 2. Poor appetite and vitamin-mineral deficiency as they occur in: patients having faulty eating habits; geriatric patients who are losing interest in food; patients convalescing from debilitating illness or surgery.

Contraindications: As with other drugs with CNS stimulating action, Alertonic is contraindicated in hyperactive, agitated or severely anxious patients and in chorea or obsessive compulsive states.

Side effects: Reports of overstimulation have been rare. Patients who are known to be unduly sensitive to the effects of stimulant drugs should be observed carefully in the initial stages of treatment.

Dosage: Adults, 1 tablespoonful; children (over 15 years old), 1 to 2 teaspoonfuls; children (4 to 15 years old), 1 teaspoonful. To be taken three times daily 30 minutes before meals.

Pediatrics

SPONSORED BY THE MARYLAND CHAPTER OF THE AMERICAN ACADEMY OF PEDIATRICS

WILSON L. GRUBB, MD, Chairman

RAY HEPNER, MD, Editor

The Physician and School Health

FRED J. HELDRICH, MD
Chairman, Committee on School Health
Maryland Chapter, American Academy of Pediatrics

Anyone caring for children must of necessity be concerned with the broad area of school health. Despite the many sub-divisions of school health that could be enumerated, the problem basically involves evaluating, protecting and promoting the health of school children and, in addition, providing for them a sound health education curriculum. Working towards this end for the child's benefit are three major groups: parents, educators, and the medical profession. Each of these groups is aided and abetted by other "special interest groups." This is especially true of the medical profession, which is helped by such groups as the Tuberculosis Association, the Heart Association, and the Society for the Prevention of Blindness. It is important that the three major groups assume primary responsibility in this area.

As stated by the Committee on School Health of the American Academy of Pediatrics, the objectives of any school health program fall into three broad categories: health appraisal, follow-up, and parent education and counseling.[1] Perhaps a fourth might be added—student education and counseling. In any event, it is easy to see how each of these broad categories requires the services of physicians to accomplish its stated aims. In many instances there is the need for the physician to do the actual work, while in others the physician can best serve as a coordinator of the many groups contributing to the school health program. This is not to imply that the physician should try to assume primary responsibility in areas where he is not fully competent, eg, school curriculum and teaching, but to say that he should stand ready to assist in all areas. This requires that he practice his art not only in the office, home or hospital, but also in the conference room.

In 1961 a committee on school health was activated by the Maryland Chapter of the Academy of Pediatrics and given the charge of surveying the field of school health in the State. One of the most encouraging aspects of the Committee's work to date has been the cordial reception it has received from others interested in school health. In particular, the educators have been most receptive to our inquiry and have demonstrated a sincere desire to work with us. At the start there seemed to exist a feeling among the educators that the medical profession as a group was indifferent to their problems although they readily agreed that certain individual physicians constituted notable exceptions. At the same time it was discovered that programs were being planned or carried out by educators to which physicians could have contributed. Was the lack of physician participation due to faulty communication or physician indifference? The Committee chose to believe the former.

A recent review by Rogers[2] on secondary school children in a Pittsburgh suburb identified the problems most frequently seen or discovered

by the routine physical examinations and screening procedures used in the schools. Perhaps the very low percentage of serious disabilities uncovered in this fashion gives testimony to the adequacy of the physical examinations and health care given these children prior to their entry into the school systems by their private physicians or local medical clinics. It is also encouraging to note that a survey in Maryland in 1963 revealed that in 17 of the 23 counties over 80% of the children entering school for the first time were accompanied by a certificate of physical examination made prior to their entry into the school system. Six counties and the City of Baltimore reported a rate ranging from 20% to 75%.[3] From these findings we can infer that the physical examination of school children prior to their entry into school is being accomplished in the majority of instances, but it would seem appropriate to strive for 100% completion.

All too often, once children are in school the physician's knowledge concerning their adjustment and progress is scanty. Most of his contact with any given child continues to take the form of periodic physical examinations, which vary in frequency depending on numerous factors not necessarily related to school performance. Frequently the physician's awareness that something is wrong with a child in school comes only when he is seen because of such symptoms as abdominal pain, headache, vomiting or even refusal to go to school. In the older student, anti-social behavior is a frequent reason for seeking medical advice.

To minimize the frequency with which such problems arise, several approaches may prove helpful. First, a psychological evaluation and an appraisal of the child's emotional health should be incorporated in the pre-school physical examination. From a more detailed investigation in these areas, many times one can predict or question the response of the first-grader to the school setting and give valuable information to the teachers that may assist them in making the child's transition from home to school a smoother one. Pollack,[4] in a recent article in the *Bulletin* from the Children's Hospital in Washington, DC, outlined some procedures for evaluating children in this fashion. All of these tests will find ready application in the physician's office.

Second, it is important to take the initiative and to ask specific questions concerning the child's progress in school at each opportunity. Recent figures[5] indicate that the vast majority of school-age children are seen by their physicians on an average of three or four times a year for various reasons. At these times appropriate questions can be put to both the child and the parents.

Third, there should be no reluctance on the part of the physician to contact the school to discuss the child's progress and to seek data and information from this source that will be helpful in treating and counseling the patient. In many instances, once the physician has evaluated the situation to his satisfaction and has recommendations to make, it may be useful to impart this information at a meeting arranged with the teachers, the school physician and the school health nurse. These conferences present an unsurpassed means of conveying the medical viewpoint to the situation.

For physicians who have a deeper interest in school health, opportunities are present to serve in other ways: (1) In many areas opportunities to serve as a school health physician are available. For the most part, the school health physician will function in an advisory capacity and act as a liaison between educators and private medical practice in the interest of the student. At the same time he is given excellent opportunities to instill medical thought and guidance in the educational process. (2) Physicians can and should serve on local school health councils. Here they will encounter the diversity of interests and opinions voiced by many special interest groups, all of which are aimed at the improvement of the health of school children, and they will be presented with an opportunity to maintain a proper balance between and among these groups and their contributions to school health. In this same context, physician participation is mandatory in planning local implementation of governmental programs which involve the area of school health directly or indirectly if the programs are to be of maximum benefit to the school child and the nation. Intelligent use of medical manpower and the existing medical data for each child is requisite to the success of these programs. Service on a school health council would probably appeal most to the civic-minded physician for it brings him into direct contact with many civic groups. (3) Finally, there continues to be an extreme need for the application of scientific investigation to the process of learning. The accumulation of accurate

data is wanting. Certainly there is a tremendous need for physician participation in this area. It is the role best assumed by the medical researcher and those in allied disciplines. The medical school setting offers the best base for operations of this nature.

In summary, the problems of school health are being met adequately in many areas, but deficiencies and gaps do remain. Of paramount importance in enhancing school health programs is the greater participation of the physician. The physician, in almost all instances, will find his genuine interested appreciated, but it remains for him to take the initiative. The plea is made here for physicians to assume this responsibility to an increasing degree.

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed ... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

700121

Ilosone®

Lilly

Erythromycin Estolate

(See next page for prescribing information.)

Ilosone®/ the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by microorganisms sensitive to its action (especially staphylococci, hemolytic streptococci, and pneumococci). The drug is therefore useful in a high proportion of bacterial diseases encountered in clinical practice and particularly in the treatment of bacterial infections of the upper and lower respiratory tract and soft tissues.

In the treatment of acute bacterial pharyngitis and tonsillitis, this antibiotic has promptly eradicated the bacteria (streptococci) and has produced a parallel prompt clinical improvement. There have been no group A beta-hemolytic streptococci resistant to this preparation. In beta-hemolytic streptococcus infections, treatment should be maintained for ten days to prevent the development of rheumatic fever or glomerulonephritis.

Erythromycin estolate has proved to be very effective in pneumococcus pneumonia and in acute bronchitis with pneumococci on culture. Bronchopneumonia and otitis media in children have responded well to its use.

The antibiotic has been used very successfully in staphylococcus infections. Good therapeutic results have been obtained in soft-tissue infections, abscesses, cellulitis, carbuncles, wound infections, and furunculosis.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents. As is the case with any treatment regimen used in these severe conditions, surgical procedures should be performed when indicated, and large dosages of the antimicrobial agents should be employed. In this fashion, Ilosone has been effective in staphylococcus pneumonia, osteomyelitis, septicemia, empyema, and meningitis.

Multiple 500-mg. doses of the drug have been useful in gonorrhea and syphilis. Since penicillin is the drug of choice for the treatment of syphilis and gonorrhea, erythromycin estolate should be employed for these infections only in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients known to be hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with pre-existing liver disease or dysfunction.

Side-Effects: Data obtained from seven years' use of propionyl erythromycin ester and erythromycin estolate (Ilosone) indicate that hepatic dysfunction with or without clinical jaundice may occur during or following courses of therapy with the drug.

Changes in liver function tests in such cases have been indicative of intrahepatic cholestasis. The symptoms appear to be the result of a form of sensitization. The initial symptoms have appeared in some cases after a few days of treatment but generally have followed one or two weeks of continuous therapy or several courses of the drug. Symptoms reappear promptly if the drug is readministered to sensitive patients, usually within forty-eight hours. Eosinophilia was noted in peripheral blood counts. The findings readily subsided without apparent residual effects when treatment was discontinued. Recovery was delayed in one reported instance. The physician indicated in this case that either drug-induced jaundice or viral hepatitis may have been responsible for the findings.

In one clinical study involving ninety-three patients treated with the antibiotic, three cases of jaundice were observed and an additional eleven cases developed some changes in liver function tests. Three of the patients had abnormal liver function tests a second time on readministration of the drug.

Even though it is assumed that not all cases of jaundice have been reported, it seems clear that the number is small compared with the amount of drug that has been used. Reported cases have included persons in whom there had been administered other drugs known to be associated at times with hepatic side-effects and cases in which the presence of viral hepatitis or other disease may have been responsible for the findings. In some of the cases, associated gastro-intestinal symptoms simulated the colic of biliary tract disease. In other instances, clinical symptoms and results of liver function tests resembled findings in extrahepatic obstructive jaundice. It appears that the occurrence of jaundice after administration of Ilosone is infrequent, but further investigations are being made to estimate its incidence more accurately.

In those cases mentioned above in which jaundice appeared to be definitely related to use of the drug, laboratory findings w characterized by increased direct-reacting bilirubin, eleva alkaline phosphatase levels, negative or weakly positive cepha flocculation and thymol turbidity tests, elevated serum glutar oxalacetic transaminase levels, peripheral eosinophilia, and n mal cholecystograms.

Individual idiosyncrasy seems evident since jaundice has been reported in other patients taking prolonged courses of medication. Patients with chronic infection have been given 1 to 2 Gm. of the drug daily for periods of two to six months, a patients with rheumatic fever have taken prophylactic doses 0.5 Gm. daily for two years without difficulty. In one group 144 patients who received the drug daily for two years, no ja dice was noted. It was of interest that members of six of th patients' families, who were not taking the drug, had episo of jaundice during the study period.

Transaminase and serum alkaline phosphatase levels w determined in a group of fifty-four adults and children who t 250 mg. of Ilosone daily for an average of sixteen months rheumatic fever prophylaxis. The results were compared w those of a similar group of forty-four patients who received pe icillin. There were no cases of jaundice in either group. Elevati of SGPT and serum alkaline phosphatase levels during the cou of treatment was observed in one patient treated with Ilos and in two patients treated with penicillin. Seven other patie in the group receiving Ilosone and four others in the penicil group showed elevations in one of the tests at some time duri administration of the drugs.

Very satisfactory therapeutic results, without toxicity, we reported in 102 pediatric patients who received short-term (te day) courses of Ilosone in the treatment of streptococcus inf tions. Results of liver function tests in these patients were co parable to those in a similar control group who had receiv penicillin.

Gastro-intestinal disturbances not associated with hepatic e fects are observed in a small proportion of individuals as a res of a local stimulating effect of the medication on the alimenta tract; however, the normal intestinal gram-negative bacteri flora is not appreciably altered by erythromycin drugs.

Although allergic manifestations are uncommon with the u of erythromycin, there have been occasional reports of urticari skin eruptions, and, on rare occasions, anaphylaxis.

Administration and Dosage: Ilosone is administered orally.

Ilosone Drops
Ilosone, 125, for Oral Suspension

For infants and for children under twenty-five pounds of bod weight, the usual dosage is 5 mg. per pound every six hours; f children twenty-five to fifty pounds, 125 mg. every six hour (Tablets Ilosone Chewable should be chewed or crushed an swallowed with water.)

For adults and for children over fifty pounds, the usual dosag of Ilosone is 250 mg. every six hours.

For severe infections, these dosages may be doubled.

When larger doses are indicated, parenteral erythromyc therapy should be considered.

In the treatment of syphilis, the recommended total dosage 20 to 30 Gm. given in divided doses for a period of ten to fiftee days. Close follow-up of the patient is necessary since erythr mycin drugs have not had adequate evaluation in all stages syphilis. Examinations of spinal fluid are recommended as pa of the follow-up therapy.

For gonorrhea, 500 mg. four times a day for four days a recommended. In the treatment of gonorrhea, patients with suspected lesion of syphilis should have a dark-field examinatio before receiving antibiotics, and monthly serologic tests shou be made for a period of three months.

How Supplied: Pulvules Ilosone, Capsules, N.F., 125 and 250 mg (equivalent to base), in bottles of 24 and 100.

Tablets Ilosone Chewable, N.F., 125 mg. (equivalent to base) in bottles of 50.

Ilosone Drops, 5 mg. (equivalent to base) per drop, in 10-cc. size packages, with dropper calibrated at 25 and 50 mg.

Ilosone, 125, for Oral Suspension, N.F., 125 mg. (equivalen to base) per 5-cc. teaspoonful, in 60 and 150-cc.-size package

An Upper Extremity Function Test

DOUGLAS CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

For a number of years, we have been using a test for upper extremity function designed to give an estimate of how useful an upper extremity is in the performance of daily activities. The original test[1] has undergone some minor changes and the form now in use in shown on page 98.

The test is based on the theory that there are certain basic functions carried out by an upper extremity, at least one of which is necessary to perform most daily activities. These basic functions are called grasp, grip, lateral prehension, pinch, placing, supination and pronation of the arm, flexion-extension of the arm, and flexion, extension and abduction of the shoulder. In addition to these basic functions, a measure of grip strength on a Smedley Dynamometer, and the pinch strength between the thumb and digits two to five, are recorded.

Pinch between thumb and digits two to five makes up a large part of the test. This activity is unique to man and is one of the reasons that his hand is so much more useful in fine movements than the hands of lower evolutionary forms.

Figures 1 through 6 illustrate the performance of the test by a patient with severe rheumatoid arthritis of the upper extremities.

The test had been used in a large number of different pathological conditions. It is particularly helpful in comparing and following hand performances in an individual patient. By comparing the results of tests performed at different time intervals in the same patient, it is possible to observe accurately how upper extremity function is changing.

We have found that performance varies from week to week in the patient with active rheumatoid arthritis. In such a patient, pain in any of the joints of the upper extremity limits function far more than static loss of range of motion, ankylosis, dislocation of joints, or ulnar deviation of the fingers.

In the hemiplegic patient, there is a fairly common pattern of return of function. In a general way, return of upper extremity motor function after hemiplegia follows the evolutionary development of hand function. That is, movement returns first in the shoulder and elbow, and is followed by return of function in the hand, with pinch between the opposable thumb and digits two to five (unique to man) coming last. If several weeks after a patient suffers an acute hemiplegia, there is no function whatsoever in the upper extremity (defined as 0 score on the test),

SCORING ITEMS 1 TO 32

3—Performs test normally.
2—Completes test, but uses abnormal movements, takes abnormally long time or has great difficulty. (Abnormal movements include using grasp instead of grip in items 5 & 6, pinch in items 7, 8 or 9, lateral prehension in items 11 to 25).
1—Performs test partially.
0—Can perform no part of test.

Describe unusual findings on back of form.

Item 9: Lateral Prehension
(Patient has arthrodesis of the first M-P joint.)

Fig 2
Item 5: Grip of 1¾″ Pipe
(Patient shows inability to flex the fingers, particularly d4 and d5, around a pipe.)

Fig 4
Item 10: Pinch of 3″ Ball
(Patient shows inability to place it on a shelf because of poor extension of the elbow.)

(Figures 5 and 6 are on the following page)

then it is unlikely that the patient will regain significant function in that extremity.

A number of other diseases, including burns and trauma to the hands, are being studied. A few patients are being studied pre- and post-operatively to evaluate the significance of changes in hand function. To date, the test has helped clarify and make more precise the nature of functional changes caused by disease, trauma and surgery.

LOOK TO THE ULTIMATE IN NURSING HOMES

What makes Community Health Facilities *different and better* than other nursing homes in Maryland? The main reason they stand out from all the other homes is that these eight health institutions are made up of skilled people whose entire lives are devoted to the profession of helping others. These pepole are interested concerned and thoroughly conscientious regarding every guest they have. At a Community Health Facility, each and every guest receives personalized individual care that guarantees them a pleasant stay whether they are receiving convalescing or restorative long term rehabilitative care.

COMMUNITY HEALTH FACILITIES FEATURE:

- Registered Nurses—24 hour nursing care
- Open medical staff—your doctor continues to care for you
- Special diets under the supervision of an Accredited Dietician
- Modern hospital equipment—Oxygen, Intravenous, Suction Therapy
- Physical Therapy Available
- Air Conditioning Available
- Religious Services
- Recreational Areas
- Separate Units provide separation of convalescent from sicker patient
- True convalescent section—Intensive are Unit
- And *best of all . . . attractive and sensible rates*

JOIN PROJECT WEIGHT WATCH.

You won't get any buttons. Or badges. Or decorations.

But you will get the satisfaction of making a weighty problem smaller.

Most people are eating too much for their own good. And when they diet, they're confused by fads, special foods, and starvation plans.

Of course, what they need are new eating habits.

That's what prompted preparation of research-tested scientific diets which are offered to you free. They're a realistic balance of the 4 food groups —meat, bread and cereals, fruits and vegetables and dairy foods. They're the kind of diets you'd write yourself, if you had the time.

Send for them. The shape of the nation is up to you.

Send me the Project Weight Watch kit of materials including diets.

PROJECT WEIGHT WATCH
FACTS, NOT FADS

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

ABBOTT

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

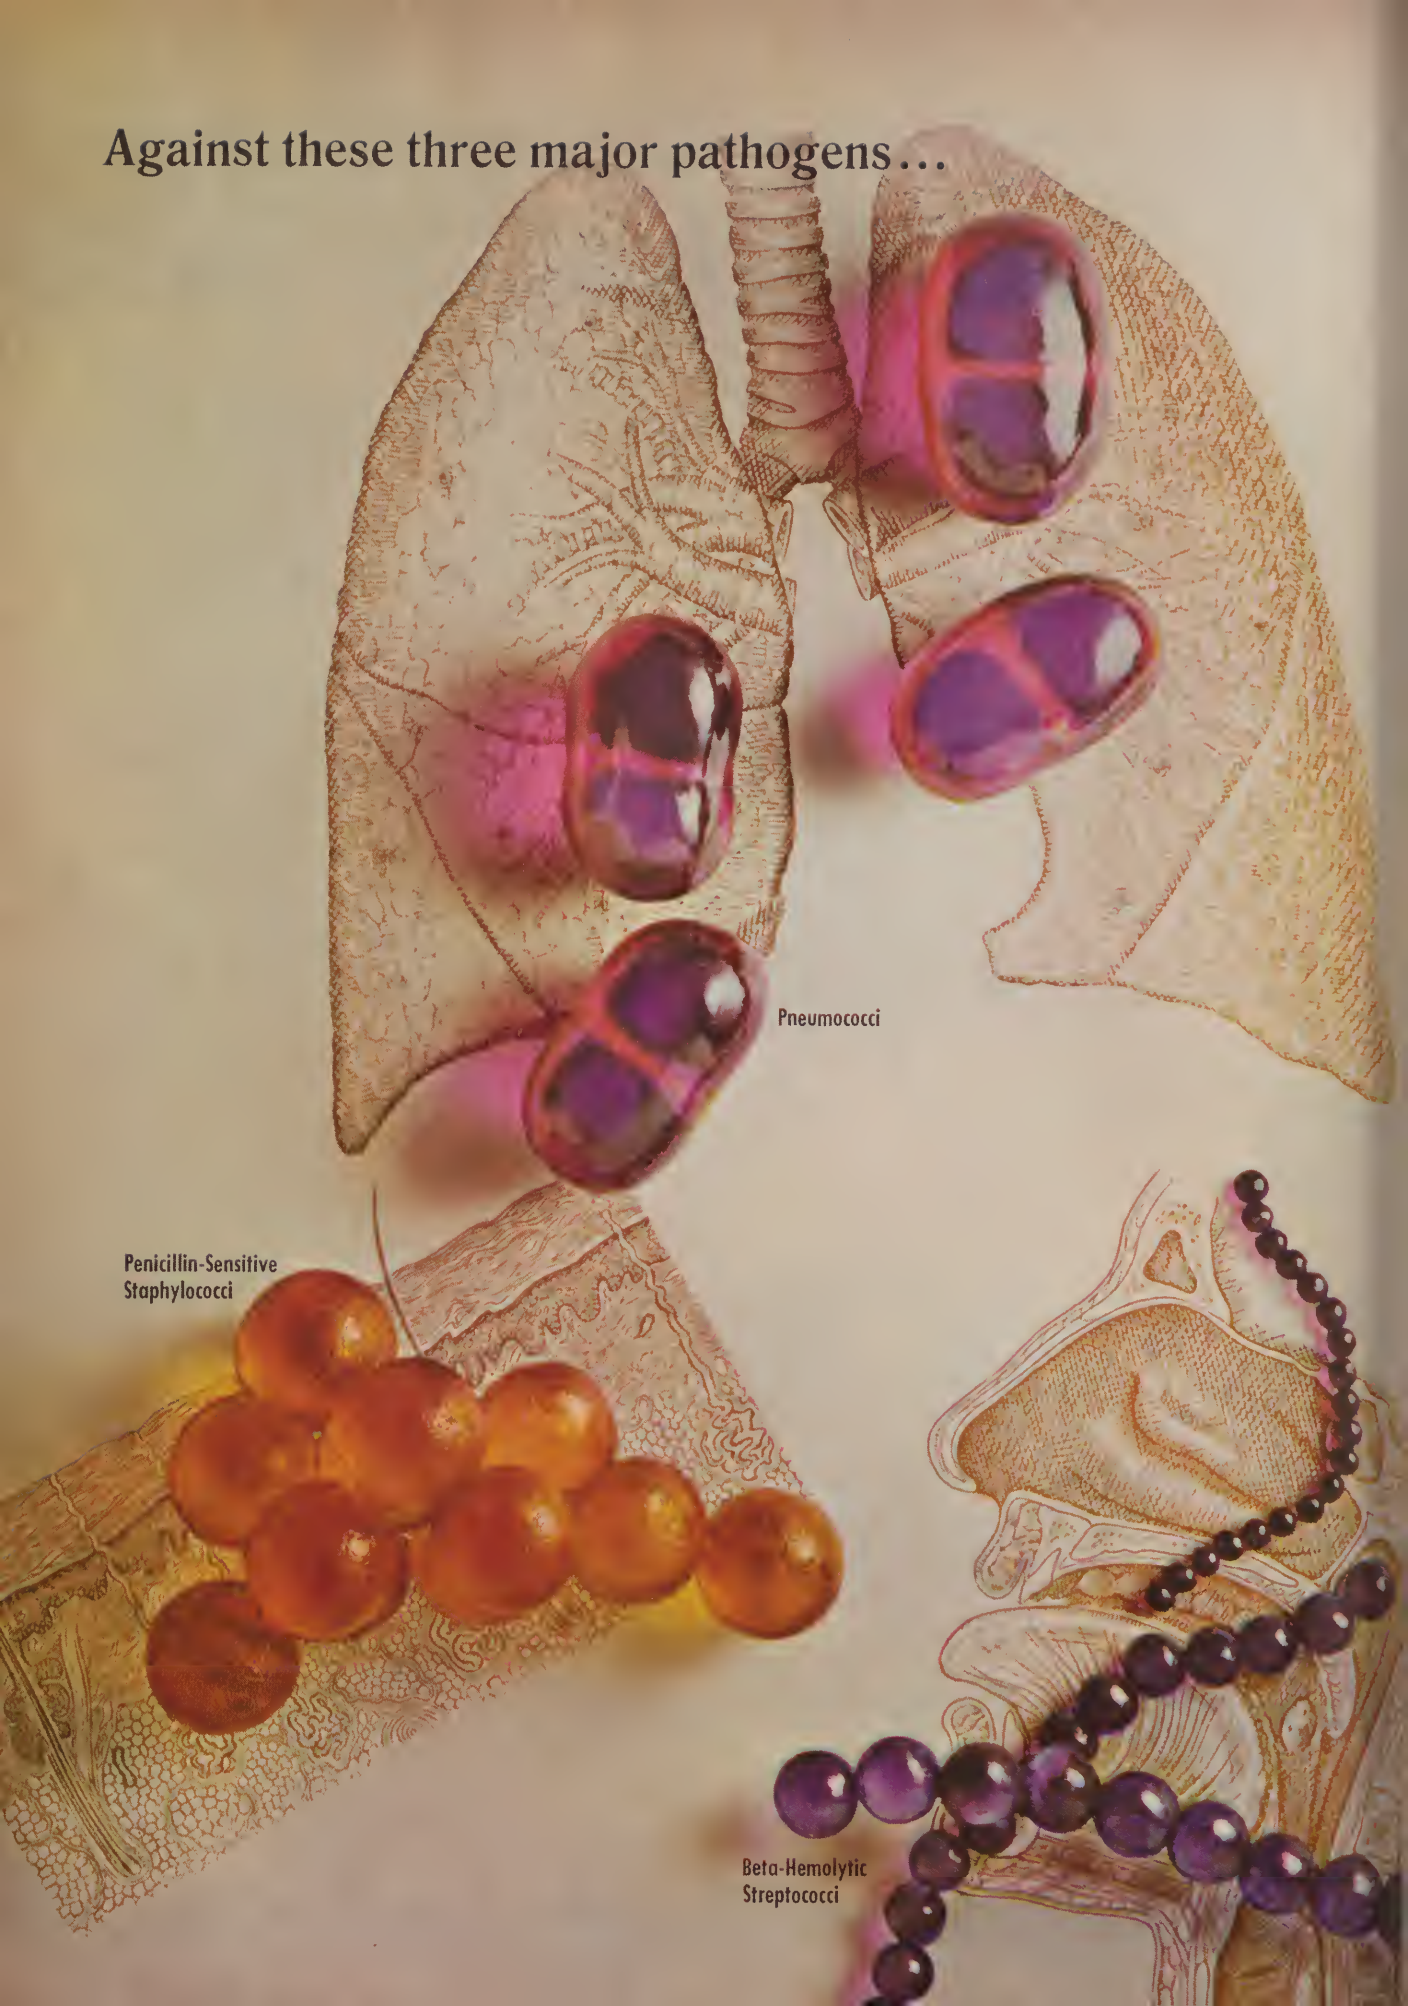
WM. P. POYTHRESS & CO., INC.
RICHMOND, VIRGINIA 23217

Manufacturers of ethical pharmaceuticals since 1856

when congestion is complicated by sulfa-susceptible bacterial invaders in the upper respiratory tract...

re-enforce your decongestant therapy



prescribe economical Trisulfaminic®

Each tablet contains: Triaminic® 25 mg. (phenylpropanolamine hydrochloride 12.5 mg., pheniramine maleate 6.25 mg., pyrilamine maleate 6.25 mg.); Trisulfapyrimidines, U.S.P. 0.5 Gm. (sulfadiazine 0.167 Gm., sulfamerazine 0.167 Gm., sulfamethazine 0.167 Gm.)

PHARMACOLOGY: Triaminic decongests and promotes drainage of nasal and paranasal passages, and prevents any further histamine-induced damage; the triple sulfonamides inhibit susceptible bacterial invaders. INDICATIONS: For congestion and infection of the upper respiratory tract caused by sulfa-susceptible organisms. DOSAGE: Adults: 2 to 4 tablets initially, followed by 2 tablets every 6 hours. Medication should be continued until patient has been afebrile for 3 days. ADVANTAGES: The advantages of Trisulfaminic in upper respiratory infections are: freedom from narcotics or alcohol; therapeutic reliability; safety; economy; ease of administration; freedom from potential sensitization to broad-spectrum antibiotics which may be reserved for lower respiratory or other infections caused by susceptible organisms. CONTRAINDICATIONS: Contraindicated in sulfonamide and antihistamine sensitivity, impaired renal function, pregnancy approaching term, and in premature infants and newborn infants during the first month of life. Do not use in patients with glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloroduodenal or bladder neck obstruction. WARNING: Use only after careful evaluation in patients with liver or renal damage, urinary obstruction, or blood dyscrasias. Deaths have been reported from hypersensitivity reactions with administration of sulfonamides. In intermittent or prolonged therapy, blood counts and liver and kidney function tests should be performed periodically. Sulfonamide therapy may potentiate the hypoglycemic action of sulfonylureas. PRECAUTIONS: Use with caution in patients with histories of significant allergy or asthma. Assure an adequate fluid intake. Because the antihistamines may cause drowsiness of varying degree, warn patients about activities requiring alertness such as driving a car or operating dangerous machinery. Use with caution in the presence of hypertension, hyperthyroidism, cardiovascular disease and diabetes. ADVERSE REACTIONS: As in all sulfonamide therapy, the following reactions may occur: headache, nausea, vomiting, diarrhea, icterus, hepatitis, pancreatitis, urticaria, rash, fever, cyanosis, hematuria, crystalluria, proteinuria, blood dyscrasias, petechiae, purpura, neuropathy and injection of the conjunctiva and sclera. If one or more of these reactions occur, the drug should be discontinued. With antihistaminic therapy there have been reports of sedation varying from mild drowsiness to deep sleep, dizziness, lassitude, inability to concentrate, fatigue, incoordination, tinnitus, blurred vision, diplopia, euphoria, nervousness, insomnia, tremors, palpitation, hypotension, headache, chest tightness, urinary frequency, dysuria, tingling of the hands, dryness of the mouth, throat, and nose, gastrointestinal disturbances such as epigastric distress, anorexia, nausea, vomiting, constipation and diarrhea and very rarely, leukopenia and agranulocytosis. Adverse reactions reported with the use of sympathomimetic amines include anxiety, tension, restlessness, nervousness, tremor, weakness, insomnia, headache, palpitation, tachycardia, angina, elevation of blood pressure, sweating, mydriasis, anorexia, nausea, vomiting, dizziness, constipation, and dysuria due to vesicle sphincter spasm. PACKAGE INFORMATION: Trisulfaminic Tablets: Supplied in bottles of 100 tablets. CAUTION: Federal law prohibits dispensing without prescription.

V-Cillin K® Lilly 700157

Potassium Phenoxymethyl Penicillin

(See next page for prescribing information.)

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K is the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly). This chemically improved form combines acid stability with immediate solubility and rapid absorption. Higher serum levels are obtained more rapidly with this penicillin than with equal oral doses of penicillin G. The higher serum levels and acid stability of V-Cillin K make it a more dependable penicillin for oral use.

V-Cillin K, Pediatric, is an oral solution of clinically proved V-Cillin K in teaspoon dosage form. When mixed as directed, each 5 cc. (approximately one teaspoonful) will contain 125 mg. (200,000 units) phenoxymethyl penicillin as the potassium salt.

Indications: V-Cillin K has been shown to be effective in the treatment of streptococcus, pneumococcus, and gonococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy and tooth extraction in those patients with a history of rheumatic fever or congenital heart disease.

Contraindication: V-Cillin K should not be administered to a patient with a history of penicillin hypersensitivity.

Precautions: V-Cillin K should be used cautiously, if at all, in a patient with a strongly positive history of allergy. Reactions occur more frequently in individuals with bronchial asthma or other allergies or in those who have previously demonstrated sensitivity to penicillin. If hypersensitivity reactions occur, the drug should be discontinued.

Adverse Reactions: Although serious allergic reactions are much less common with administration of oral penicillin than with intramuscular forms, skin rash, symptoms resembling those of serum sickness, or other manifestations of penicillin allergy may occur. When penicillin is administered, measures for treating anaphylaxis should be readily available. Those include epinephrine, oxygen, and pressor drugs for relief of immediate allergic manifestations as well as antihistamines and corticosteroids for delayed effects.

The use of antimicrobial agents may be associated with the overgrowth of antibiotic-resistant organisms; in such a case, antibiotic administration should be stopped and appropriate measures taken.

Administration and Dosage: For Tablets V-Cillin K and for V-Cillin K, Pediatric, the usual dosage ranges from 125 mg. (200,000 units) three times a day to 500 mg. (800,000 units) every four hours. For infants, the daily dosage may be 50 mg. per Kg. of body weight divided into three doses.

Beta-hemolytic streptococcus infections without associated bacteremia may be treated with 200,000 to 400,000 units three times a day. Therapy should be continued for a minimum of ten days to prevent development of rheumatic fever and/or other serious complications. Dosage for routine streptococcus prophylaxis in patients with a history of rheumatic fever or congenital heart disease may be 200,000 units once or twice daily. When such patients undergo tonsillectomy, tooth extraction, or other minor surgery, the prophylactic dose should be 500,000 units every six hours given two days prior to surgery and for two days postoperatively. If oral medication is not feasible on the day of surgery, parenteral therapy should be considered. Mild to moderately severe pneumococcus pneumonia has been treated effectively with 250 mg. every six hours.

In staphylococcus infections, 400,000 units or more should be given every six to eight hours in conjunction with indicated surgical procedures.

For gonorrhea in males, 500 mg. (800,000 units) every six hours for three doses may be employed; in females, 500 mg. every four hours for six doses are recommended. Patients with a suspected lesion of syphilis should have a dark-field examination before receiving penicillin and monthly serologic tests for a minimum of three months.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 units) in bottles of 50 and 100; 250 mg. (400,000 units), and 500 mg. (800,000 units) in bottles of 24 and 100.

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,000 units) per 5 cc. of solution, in 40, 80, and 150-cc.-size packages.

Coronary Care Units: Part I

LEONARD SCHERLIS, MD
Head, Division of Cardiology

JERRY SALAN, MD
Director, Coronary Care Unit

University of Maryland Hospital and School of Medicine

Atherosclerosis and its complications are the leading causes of death today despite the many advances which have been made in the last 20 years. In the United States, more than one-half million deaths occur each year from myocardial infarction with over 150,000 occurring in persons less than 65 years of age. More than one-half million patients are admitted annually to hospitals with a diagnosis of myocardial infarction. The hospital mortality for acute myocardial infarction is approximately 30 deaths per 100 admissions and 70% of all of these deaths occur in the first five days after admission. Many of these fatalities are due to cardiac arrhythmias and cardiac arrests.

At the present time, a positive program is available which promises to have an immediate effect on reducing the mortality rate from myocardial infarctions: the coronary care unit. Much of the impetus for the development of coronary care units evolved from the encouraging results of cardiopulmonary resuscitation in instances of cardiac arrest. In 1964, Jude, Kouwenhoven, and Knickerbocker reported a survival rate of 25% in a collected series of 1,270 patients. In one series, 69% of the arrests occurring in the operating room were resuscitated to pre-arrest status as compared with 20% of those in the general hospital area. Success in cardiac resuscitation measures is dependent not alone on the etiology of the arrest, but on the promptness and efficacy with which resuscitation efforts are applied. The first coronary care unit in the United States was established in the spring of 1962 at the Bethany Hospital in Kansas City and the second several months later in Philadelphia. There were less than 50 coronary care units in 1965, 100 in March, 1966, and there are more than 200 at the present time.

This rapid acceptance of the concept of coronary care units is based upon evidence that the availability of the necessary medical staff, nursing personnel, monitoring equipment, and therapeutic measures can significantly reduce the anticipated mortality in the initial course of an acute myocardial infarction Assuming that cost was not a factor, the "best" therapy available ten years ago for the patient with a myocardial infarction was a private room, private nurses around the clock, the "frequent" recording of vital signs, ie, every one to three hours, and specific medication as dependent upon the personal experience of the attending physician. The occurrence of such sudden events as cardiac failure or arrhythmias was

too often characterized by significant delays in recognition and therapy until the episode had become clinically severe and obvious. Cardiac arrest signaled the termination of therapy and the death of the patient. By way of contrast, the concept of a coronary care unit is to gather together in one area the personnel and materials necessary to recognize and treat early changes in the status of the patient with a myocardial infarction before they become emergencies.

The coronary care unit must be evolved carefully, with all of the professional, administrative and service personnel brought into the early stages of planning. Careful attention to all details of construction and administration is necessary because of the needs which will arise for adequate conduits, electrical outlets, oxygen, suction, lighting, console, nurse and physician desks, utility room, and emergency resuscitation and communication equipment.

The selection of monitoring equipment poses problems only because of the availability of satisfactory products from many suppliers. Estimates for equipment range from $1,000 to $5,000 per bed, depending on the complexity of the equipment desired. There are several guidelines which are of value in making a final choice:

1. The monitoring equipment should be kept comparatively simple for routine operation.

2. The most reliable parameter to follow is the electrocardiogram and it should be followed constantly.

3. A wall-mounted oscilloscope at the bedside is a basic requirement for the patient and the oscilloscope should be readily visible from as much of the unit as possible.

4. The central nursing station should have a "slave" oscilloscope and electrocardiograph recording equipment so that an electrocardiogram can be selectively triggered by an alarm and the patient's position indicated on the tracing.

5. A visible and audible alarm system for each patient is required. A "pulse rate beeper" is usually not advisable.

6. Rate-meters with high-low alarms at the bedside and at the nurse's stations are desirable.

7. Pacemakers and defibrillators should be immediately available.

8. There should be equipment for determining central venous pressures.

9. The monitoring of respiration, temperature, and intra-arterial blood pressure is technically feasible and under certain circumstances desirable.

10. The use of memory tapes is not necessary on a routine basis, but is of value for investigation and teaching purposes.

11. Prime consideration in the selection of any equipment is the manufacturer's service and reliability, the frequency of repair, and the safety of the equipment.

The equipment should be so selected, positioned, and utilized that it does not constitute a physical or conceptual barrier to the chief function of the coronary care unit, ie, careful observation of the patient and the prompt institution of emergency therapy. Equipment is used as an adjunct and is not to replace direct observation.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

A Challenge to the Medical Profession

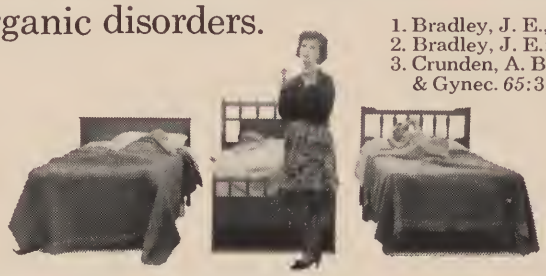
ISADORE TUERK, MD
Commissioner, Department of Mental Hygiene, State of Maryland

Early this year the United States Court of Appeals for the Fourth Circuit (which includes Maryland and four other states) held, in the case of Driver v Hinnant, that to convict a chronic alcoholic of public drunkenness violates the prohibition against cruel and unusual punishment contained in the Eighth Amendment to the United States Constitution. The defendant, Joe Driver, was represented by attorney-at-law Peter Barton Hutt, whose efforts on behalf of alcoholics are remarkably similar to those of Dorothea Lynd Dix a hundred years ago on behalf of the mentally ill.

The decision carries a strong recommendation to Maryland judges to transfer to treatment and rehabilitation agencies their centuries-old responsibility for alcoholics who have been arrested for, quite simply, displaying a symptom of their disease.

What are the implications of the historic decision for physicians, general hospitals, and other public and private agencies concerned with services to alcoholics and programs of alcoholism control?

In the first place, the decision demands that we demonstrate with much more vigorous action our conviction that alcoholism is a disease, and the alcoholic a sick person who can and should be treated. The action we have taken in the past has resulted in treatment in psychiatric hospitals and clinics of approximately 3,000 alcoholics—probably three per cent of the State's total alcoholic population. But a recent survey indicates that in the 18 months between January 1, 1964 and July 1, 1965, more than 3,500 individuals had from two to 18 convictions a year as drunkenness offenders in Maryland courts. If, as we are advised, 90% to 95% of this group have serious drinking problems, then the statistics suggest that we must more than double our present specialized facilities in order to provide appropriate treatment for those alcoholics now revolving helplessly through Skid Row, police lock-ups, courts and jails.



In the second place, the alcoholics in this long-neglected population are almost all homeless men, socially as well as economically bankrupt. To treat them as sick people, we must not only expand our present services, but add new ones: medically supervised detoxification units, for example; a network of residential facilities geared, to quote Mr. Hutt, "to reverse the process of degradation that has gradually forced the derelicts down to their present position;" and, of course, the long-term rehabilitation facility to which this State is already committed.

Togetherness....

...can be rough when epidemics of nausea and vomiting strike a family. Emetrol offers prompt, safe relief. It is free from toxicity[1] or side effects[2,3] and will not mask symptoms of serious organic disorders.

Fort Washington, Pa.

Emetrol®
phosphorated carbohydrate solution
emesis control

Finally, the decision is a warning that we must take *immediate* action to provide for the population under discussion if we are to avoid tragic suffering and death in the back streets and alleys of our State. Again to quote Mr. Hutt:

"Cases are now proceeding through the courts in various states which may be presented to the Supreme Court within the year. Thus, it can . . . be anticipated that within a short period of time the United States Supreme Court will hand down a ringing decision adopting the result of the . . . Driver decision as a nation-wide rule of law. Public officials should be urged . . . to act now to set up reasonable public health programs for the treatment of alcoholics before the courts require them to do so."

RESEARCH IN PLASTIC SURGERY

The secret of successful survival of skin and organ transplants in man may lie in massive dosing of the recipient with material derived from certain strains of heat-killed streptococci and staphylococci.

Since 1964, researchers at the New York University Medical Center have been identifying and testing bacterial micro-organisms which are highly effective in sensitizing mammals to tissue transplants. Since these micro-organisms are widespread in nature, they offer a limitless supply of transplantation antigens and a possible answer to safe suppression of the body's natural rejection response to foreign tissue.

This information was disclosed in a report made by a research team at the New York University Medical Center to The John A. Hartford Foundation, Inc., which provided a grant of $132,487 to the Center's Institute of Reconstructive Plastic Surgery in 1964.

From New York University News Bureau, Jan, 1967.

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, *Commissioner*

HIGHLIGHTS

New Test for Rubella Immunity

As of January 3, a new, highly sensitive, rapid, and reliable test for rubella antibody was made part of the routine examination of all pregnancy blood specimens at the Bureau of Laboratories.

Maryland is the first state to offer the "HI" (Hemagglutination Inhibition) test, which was developed by scientists in the Division of Biologics Standards at the National Institutes of Health.

The new procedure requires only a few hours, is extremely accurate, and can demonstrate immunity acquired many years previously. When rubella is suspected, a second test made after a ten-day interval will show whether the antibody represents old immunity or a new disease process.

Commissioner Elected to AAPHP

State Health Commissioner William J. Peeples, MD, was chosen President-Elect of the American Association of Public Health Physicians at the annual meeting in California. He will assume the presidency next year.

Grant to Governor's Commission on Tuberculosis

The Governor's Commission to study tuberculosis in Maryland, created in 1965, has received a $10,950 grant from the Department and the Maryland Tuberculosis Association to assist in completion of the work. The study was requested by these agencies and by the Medical and Chirurgical Faculty of the State of Maryland.

Clinical Laboratory Tests in Maryland

In Maryland's 118 registered laboratories, excluding those operated by the State or by the federal government, 10,200,000 tests were performed in 1965—9.1 million in hospital laboratories and 1.1 million in private or "independent" clinical laboratories.

Not subject to the new regulations governing licensed laboratories are the office laboratories of practicing physicians, where an estimated 7 million tests are performed each year. The Bureau of Laboratories is attempting to raise the level of dependability of these office procedures by (1) recommending that the US Public Health Service provide guidance by evaluating the relative merits of the various commercially available kits and "sticks," and (2) developing training courses for office technicians, to be given at the request of a physician.

Maryland's Hill-Burton Plan Approved

The 1967 State of Maryland plan for use of Hill-Burton funds in the construction and modernization of hospital and medical facilities has been approved by the US Department of Health, Education, and Welfare. This makes available, in matching funds for this fiscal year, $3,519,935, which is allocated to projects already approved by the Advisory Council on Hospital Construction.

Premature Infant Training Program

In cooperation with the Johns Hopkins Hospi-

DIARRHEA

CANTIL®
(mepenzolate bromide)

LAKESIDE

Diarrhea, one of the most vexing symptoms of common G. I. disorders can often be curbed with Cantil (mepenzolate bromide), bringing welcome relief to the harassed patient. Relatively specific for the hyperactive colon, it helps reduce diarrhea, pain and spasm with minimal effect on other viscera. Cantil (mepenzolate bromide) is indicated whenever these symptoms are associated with irritable colon, gastroenteritis, diverticulitis, and mild to moderate ulcerative colitis.

It is an anticholinergic drug without narcotic properties. Side effects are usually mild.

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth, blurring of vision, constipation, nausea, vomiting, bloating and dizziness may occur but are usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy — withhold in glaucoma. Contraindicated in patients sensitive to phenobarbital and/or Cantil (mepenzolate bromide); in toxic megacolon, obstruction of G. I. or G. U. tract.

SUPPLIED: CANTIL (mepenzolate bromide) — 25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL — containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

tal, the Division of Maternal and Child Health is offering to graduate professional nurses a work-study program in the care of low-birth-weight infants in hospital nurseries. Four sessions have been scheduled for the two-month, tuition-free course, which is given at the Children's Medical and Surgical Center of the hospital.

Revised Maryland Nursing Manual Published

The Department's "Manual of Nursing and Special Procedures," recently revised, is especially useful for development of comprehensive programs for care of the sick in the home, and should be particularly helpful in implementing the "home health services" provided for in the federal government's program of health insurance for the aged. The manual is in demand by agencies in other states as a standards guide.

Medicare's Extended Care Facilities Confusion

A concentrated effort has been made to correct what seemed a general misapprehension regarding extended care facilities—namely, that up to 100 days of ordinary nursing home care would be covered, wholly or in part, for Medicare beneficiaries, beginning January 1, 1967.

The following information may prove helpful to physicians in explaining the conditions of the coverage to their medicare patients: An extended care facility is a special kind of nursing home offering 24-hour skilled nursing care, and meeting certain other requirements. It is primarily a convalescent center, designed for the recently hospitalized patient who is not ready to return home, but still requires a high level of nursing or rehabilitative care for a limited period.

An extended care facility will most often be a wing or unit of a hospital or nursing home, rather than a completely independent institution. Other facilities are classifed by the new state regulations as "long-term care" and "personal care" homes. Although these, too, must be licensed by the State, they are not eligible for Medicare payments.

There are, as well, certain conditions which apply to the patient:

1. He must, under order of a physician, have spent at least three days in a general hospital for treatment of an acute illness.
2. He must, of course, have become eligible for Medicare before his discharge from the hospital, and his discharge must have taken place on or after July 1, 1966.
3. He must enter or have entered an extended care facility within 14 days after his discharge.
4. He must require continued, skilled nursing care for the condition for which he was hospitalized.

If the physician decides, before the 100 days have passed, that he no longer needs the services of an extended care facility, his Medicare benefits cease. Whether he remains in the facility or transfers to another type of nursing home, he will have to pay further bills himself.

Of course, needy or medically needy persons eligible for Medical Assistance may continue to receive nursing home care under this State program. Administered by the Health Department, the Medical Assistance program does not cover personal or custodial care, but needy persons may qualify for such benefits through the Welfare Department.

IRON DEFICIENCY

ANEMIA

Imferon®
(iron dextran injection)

There's as much iron . . . 250 mg. . . . in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron . . . or orally administered iron proves ineffective or impractical . . . or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves. Precise dosage is easily calculated.

LAKESIDE

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as a source of iron; infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

Learn To Do Your Part In The Prevention Of Disease

Baltimore's Health in 1966

The following events are described as the most significant health developments of 1966.

1. Rapidly changing child-bearing patterns that result in a decline in total births and, as a consequence, smaller size families.
2. Highly successful control of all child diseases for which a specific inoculant exists, including diphtheria, whooping cough, tetanus, and poliomyelitis. (Measles, a childhood disease now subject to near eradication by vaccination, occurred with a high frequency during the early part of the year, before the new vaccine could be widely used.)
3. No essential reduction in active tuberculosis, nor in the venereal diseases.
4. An exceptionally severe attack upon the population by infectious hepatitis.
5. An exceptional loss of life due to homicide.
6. A record high loss of life due to accidents.
7. No significant change in the major disabling conditions, heart disease, cancer, stroke and acute respiratory disease.

The principal administrative accomplishments cited are:

1. Establishment of comprehensive pediatric centers for the care of children in poor economic circumstances.
2. Commencement of a revised medical care program for indigent and medically indigent families under Title 19 of the Social Security Act, the program known nationally as Medicaid and locally as the Maryland Medical Assistance Program.
3. Improvement of the tuberculosis control program through the establishment of a Southeastern clinic and the employment of additional staff for patient care.
4. Expansion of family planning services in hospital obstetrical departments by the Planned Parenthood Association, and within the maternal hygiene clinics of the City Health Department.
5. Intensification of case-finding efforts among inner-city school-age children to discover physical factors contributing to poor intellectual performance.
6. Launching of a measles eradication effort through an extensive vaccination program among preschool children.
7. Further development of a sound and scientific program of sampling of the air to achieve control of atmosphere pollution.

Among the major disappointments was the failure to gain financial support for an urgently needed rodent elimination program.

Environmental Sanitation

The following year-end summation of important aspects of the work of the Sanitary Section has been prepared by George W. Schucker, director of Sanitary Services, Baltimore City Health Department.

Environmental Hygiene: The Division of Community Sanitation handled 3,230 complaints of

DIURESIS

MERCUHYDRIN®
(meralluride injection)

LAKESIDE

Twenty years ago the publication of "A System for the Routine Treatment of the Failing Heart"[1] established a schedule of diuretic therapy as a primary factor in the treatment of acute congestive failure. With emphasis upon daily injections of Mercuhydrin (meralluride injection) until dry weight was obtained, Gold, et al. achieved a 40% increase in improvement, in ⅓ the time, over other methods then current. Today, most medical texts continue to recommend parenteral mercurials in acute congestive failure when prompt diuresis is indicated.

Recently Modell[2] has stated: "The mercurial diuretics are the injectable diuretics of choice since they are the most potent as well as the most dependable. Their toxicity is not an important consideration either by comparison with other potent diuretics or in relation to the seriousness of the conditions in which they provide such excellent relief."

IN BRIEF

Mercuhydrin is indicated in edema of cardiac or hepatic origin and in the nephrotic syndrome; it is contraindicated in acute nephritis and in anuric or oliguric states. *The usual adult dose is one to two cc. daily or every other day until "dry weight" is obtained.* Sensitivity is rare but small initial doses are advised to minimize potential reactions; vertigo, fever, and rash have occurred. Overdosage may produce electrolyte depletion, muscle cramps, and G. I. reactions. Supplied: 1 cc. and 2 cc. ampuls in boxes of 12, 25 and 100; 10 cc. rubber capped, multiple-dose vials (intramuscular or subcutaneous use only) in boxes of 6 and 100.

2. Modell, Walter: *Drugs of Choice 1966-1967,* p. 97, 1966.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

insanitary conditions and 2,255 inspections of day care centers, convalescent homes, foster homes, hospitals and other institutions. Eleven newly constructed swimming pools brought the total for regular inspection to 82. Inspection programs initiated in 1966 included the inspection and licensing of ambulances under City Ordinance No. 734 and the sanitary inspection of clinical laboratories conducted in cooperation with the Bureau of Laboratories of the Maryland State Department of Health.

The Division of Rodent Control serviced 3,300 complaints of rodent and insect infestation, made 16,810 inspections, and investigated 71 cases of rat bite. Training in rodent control procedures was conducted for the Interacting Neighborhood Council of the Druid area and for personnel of the Baltimore City Hospitals, the Maryland Penitentiary and the City Jail. In addition, a new training program for neighborhood, church and improvement groups was instituted to assist these groups in organizing for the sanitary improvement of their localities. Graduates of this program were appointed Volunteer Sanitation Organizers.

Food Control: Routine inspections of about 10,000 food establishments, including retail, wholesale, manufacturer's and institutional food units, disclosed improvement in sanitary conditions, with 64.8% of all establishments found to be entirely satisfactory as compared with 60.7% in 1965. Approximately 850 complaints were investigated, 975 violation notices were issued, and nearly 400,000 pounds of food were condemned as unfit for human consumption. Of the 16 incidents investigated as possible food poisoning outbreaks, only 3 were found to be caused by food. Notable among Bureau of Food Control activities in 1966 were: the closing of an unlicensed plant providing smoked salmon; participation in a plastic garbage can experiment at 20 local food establishments, which definitely proved plastic cans unsuitable as refuse containers; the investigation of suspected cases of botulism on a German freighter; and the distribution of food poisoning prevention kits to over 700 churches, social clubs and caterers.

Meat Inspection: The Bureau of Meat Inspection made 32,000 inspections of City and County slaughtering and meat processing plants. In this work the bureau staff supervised the slaughter of 175,000 animals and the processing of approximately 27,000,000 pounds of meat and meat products. Bureau veterinarians condemned 250 animals and 27,000 animal parts for having various diseases, and 4,200 pounds of meat products as unfit for human consumption. Rabies examinations of dogs were made in connection with 832 dog bite cases. The Bureau also supervised and participated in the city-wide rabies immunization program, jointly sponsored by State and local veterinary associations and the Maryland State Department of Health. Over 6,000 City dogs were vaccinated.

Milk Control: The most significant events in milk control activities in 1966 were (1) The control of pesticides as a source of contamination of the City's pasteurized milk supply, and (2) the achievement, for the 11th consecutive year, of a milk supply in which no unpasteurized milk was sold in Baltimore City.

Daily inspections were made in the City's eight milk plants to assure that all raw milk was properly pasteurized and made safe for consumption. This program of daily inspection of milk plants is a unique and essential public health measure because it is geared to prevent the sale of unpasteurized milk to the public and ensures a safe milk supply for the citizens of Baltimore at all times. Cooperation continued with the US Public Health Service and the Maryland State Department of Health in testing for radioactive fallout in milk and no unsafe levels were discovered. The milk industry continued its self-inspection activities and reported its results to the Department. Noteworthy also was the fact that 1966 was the first full year in which all milk was transported from the dairy farms to milk plants in the City in truck tanks.

Industrial Hygiene: The Metropolitan Baltimore Air Quality Survey, an official project of the Baltimore City Health Department, the Maryland State Department of Health, and the Baltimore and Anne Arundel County Health Departments, was continued during 1966 with new equipment purchases and site selections. A new portable air sampling trailer designed by the committee was exhibited at the National Conference on Air Pollution and drew favorable comment. Follow-up inspections of 120 medical X-ray units were

DEPRESSION

NORPRAMIN®
(desipramine hydrochloride)

ANTIDEPRESSANT FOR RAPID IMPROVEMENT

At the recommended dosage level —initially, 150 mg. per day— gratifying remission of the signs and symptoms of depression typically begins in 2-5 days. Its specificity for depression, rapidity of action and usually mild side effects are significant reasons for prescribing NORPRAMIN (desipramine hydrochloride) in depression of any type . . . any degree of severity.

A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

IN BRIEF:

INDICATIONS: In depression of any kind —neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

CONTRAINDICATIONS: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease, epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor.

RELATIVE CONTRAINDICATIONS: (1) Patients with a history of paroxysmal tachycardia. (2) Patients receiving concomitant therapy with thyroid, anticholinergics or sympathomimetics may experience potentiation of effects of these drugs. (3) Safety in pregnancy has not been established.

PRECAUTIONS: (1) Outpatient use of desipramine hydrochloride should not be substituted for hospitalization when risk of suicide or homicide is considered grave. (2) If serious adverse effects occur, reduce dosage or alter treatment. (3) In patients with manic-depressive illness a hypomanic state may be induced. (4) Discontinue drug as soon as possible prior to elective surgery.

ADVERSE EFFECTS: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, anxiety, agitation and stimulation, insomnia, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, tremor, allergy, agranulocytosis, altered liver function, ataxia, and extrapyramidal signs.

DOSAGE: Optimal results are obtained at a dosage of 50 mg., t.i.d. (150 mg./day). **SUPPLIED:** NORPRAMIN (desipramine hydrochloride) tablets of 25 mg.; bottles of 50, 500 and 1000; and tablets of 50 mg., in bottles of 30, 250 and 1000.

Posed by professional model.

You can't set her free. But you can help her feel less anxious.

You know this woman.

She's anxious, tense, irritable. She's felt this way for months.

Beset by the seemingly insurmountable problems of raising a young family, and confined to the home most of the time, her symptoms reflect a sense of inadequacy and isolation. Your reassurance and guidance may have helped some, but not enough.

SERAX (oxazepam) cannot change her environment, of course. But it can help relieve anxiety, tension, agitation and irritability, thus strengthening her ability to cope with day-to-day problems. Eventually—as she regains confidence and composure—your counsel may be all the support she needs.

Indicated in anxiety, tension, agitation, irritability, and anxiety associated with depression.

May be used in a broad range of patients, generally with considerable dosage flexibility.

Contraindications: History of previous hypersensitivity to oxazepam. Oxazepam is not indicated in psychoses.

Precautions: Hypotensive reactions are rare, but use with caution where complications could ensue from a fall in blood pressure, especially in the elderly. One patient exhibiting drug dependency by taking a chronic overdose developed upon cessation questionable withdrawal symptoms. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose; excessive prolonged use in susceptible patients (alcoholics, ex-addicts, etc.) may result in dependence or habituation. Reduce dosage gradually after prolonged excessive dosage to avoid possible epileptiform seizures. Caution patients against driving or operating machinery until absence of drowsiness or dizziness is ascertained. Warn patients of possible reduction in alcohol tolerance. Safety for use in pregnancy has not been established.

Not indicated in children under 6 years; absolute dosage for 6 to 12 year-olds not established.

Side Effects: Therapy-interrupting side effects are rare. Transient mild drowsiness is common initially; if persistent, reduce dosage. Dizziness, vertigo and headache have also occurred infrequently; syncope, rarely. Mild paradoxical reactions (excitement, stimulation of affect) are reported in psychiatric patients. Minor diffuse rashes (morbilliform, urticarial and maculopapular) are rare. Nausea, lethargy, edema, slurred speech, tremor and altered libido are rare and generally controllable by dosage reduction. Although rare, leukopenia and hepatic dysfunction including jaundice have been reported during therapy. Periodic blood counts and liver function tests are advised. Ataxia, reported rarely, does not appear related to dose or age.

These side reactions, noted with related compounds, are not yet reported: paradoxical excitation with severe rage reactions, hallucinations, menstrual irregularities, change in EEG pattern, blood dyscrasias (including agranulocytosis), blurred vision, diplopia, incontinence, stupor, disorientation, fever, euphoria and dysmetria.

Availability: Capsules of 10, 15 and 30 mg. oxazepam.

To help you relieve anxiety and tension

STATE OF MARYLAND

Department of Mental Hygiene

Isadore Tuerk, MD, Commissioner

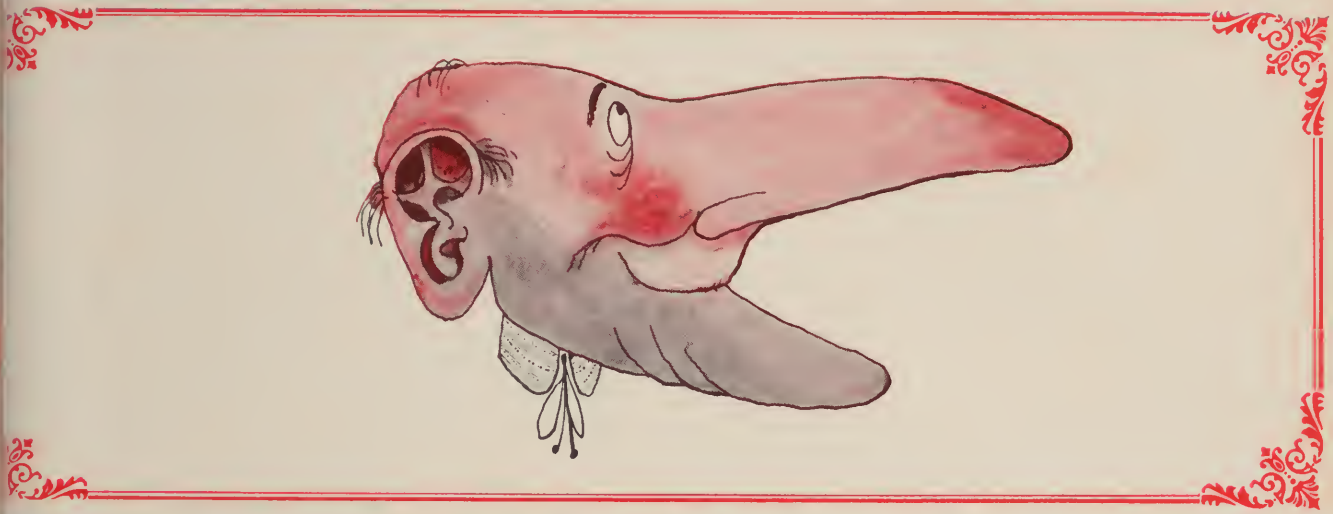
Kurt Gorwitz, Statistics Director

Maryland's Mental Hospitals Four Years After Desegregation

Admissions to Maryland's four major mental hospitals were placed on a regional basis in January, 1963. Since that time, the majority of all patients admitted to each of the four have been white. The plan for the desegregation of these facilities, however, did not provide for the transfer of patients already in residence. Since many of these continue to be hospitalized, integration has been gradual and concentrated primarily in the short-term active treatment areas.

PERCENT OF ALL PATIENTS NONWHITE

Date	Total	Crownsville	Eastern Shore	Springfield	Spring Grove
June 30, 1963	23.6	89.0	6.1	4.8	3.0
Dec 31, 1963	23.4	85.9	7.6	6.2	4.5
June 30, 1964	23.3	81.5	8.5	7.6	5.8
June 30, 1965	24.4	75.0	12.8	10.2	8.3
June 30, 1966	25.4	71.9	16.9	12.8	9.5



Prior to this change in policy, white admissions had in effect been on a regional basis (to three hospitals) while nonwhite admissions had been limited to one facility (Crownsville). The revision thus brought mental hospitals considerably closer to some segments of the nonwhite population. As a result, although both the number of white and the number of nonwhite admissions have continued to increase, the latter figure has been rising at a faster pace. Latest available data indicate that 28.2% of all patients admitted to the above facilities were nonwhite, as compared with 26.2% reported four years earlier. This change has not been uniformly distributed, however. The nonwhite proportions among patients admitted for psychotic disorders or for alcoholism have remained virtually unchanged (approximately 31% and 25%, respectively); the major change has been among patients admitted for psychoneurotic and personality disorders, the percent of nonwhite having increased from 20.8 to 29.3 during the four-year period.

Proportionally, nonwhite admissions to the State hospitals have continued to be nearly twice as frequent as white. In part, this is related to the concentration of Negroes in Baltimore's inner core slum areas where rates of most types of treated mental illnesses and of other public health problems are substantially above average. In part, also, this reflects the much greater use of alternative psychiatric services (particularly in privately operated hospitals and in private practice) by the white middle class. Since State hospitals are only one of a variety of psychiatric resources available to the community, desegregation of these facilities by itself can therefore not necessarily be expected to provide the opportunity for equal care to meet the needs of all population segments.

for noses of every description, one safe and sure prescription:

Otrivin®

(xylometazoline CIBA)
on Rx only

■ quickly relieves congested nose
■ action is gentle, yet prolonged
■ side effects are minimal

)ICATION: Nasal congestion. CONTRAINDICATION: Do not use patients sensitive to small doses of sympathomimetic substances. \RNINGS: Prolonged or excessive use may cause rebound congesn. Use cautiously in patients with hyperthyroidism, coronary artery ease, hypertension, and diabetes. CAUTION: Do not shake Nasal ray. Rinse Nasal Solution dropper or Nasal Spray tip in hot water er each use. No more than one person should use the same dropper ttle or nasal spray.

)E EFFECTS: Occasional local reactions: rebound congestion, ght burning or stinging, sneezing, dry nose. Occasional systemic ects: headache, drowsiness, lightheadedness, insomnia, palpitans. Overdosage in young children may produce profound sedation.

SAGE: **Adults:** *Nasal Solution*—2 or 3 drops in each nostril every 6 hours. *Nasal Spray*—Squeeze rapidly once or twice in each nosevery 4 to 6 hours. **Children under 12:** *Pediatric Nasal Solution*—in infants under 6 months. *Pediatric Nasal Spray*—Squeeze rapidly once in each nostril holding tube upright; repeat every 4 hours as necessary. SUPPLIED: OTRIVIN® hydrochloride (xylometazoline hydrochloride CIBA) *Nasal Solution*, 0.1%; dropper bottles of 1 fluidounce, bottles of 1 pint. *Nasal Spray*, 0.1%; plastic squeeze tubes of 15 ml. *Pediatric Nasal Solution*, 0.05%; dropper bottles of 1 fluidounce. *Pediatric Nasal Spray*, 0.05%; plastic squeeze tubes of 15 ml. *Nasal Solutions* contain either 0.1% or 0.05% xylometazoline hydrochloride, triethanolamine, hydrochloric acid, sodium chloride, and phenylmercuric acetate 1:50,000 as preservative in water. *Nasal Sprays* contain either 0.1% or 0.05% xylometazoline hydrochloride, potassium phosphate monobasic, potassium chloride, sodium phosphate dibasic, sodium chloride, and benzalkonium chloride 1:5000 as preservative in water. *Consult complete literature before prescribing.*

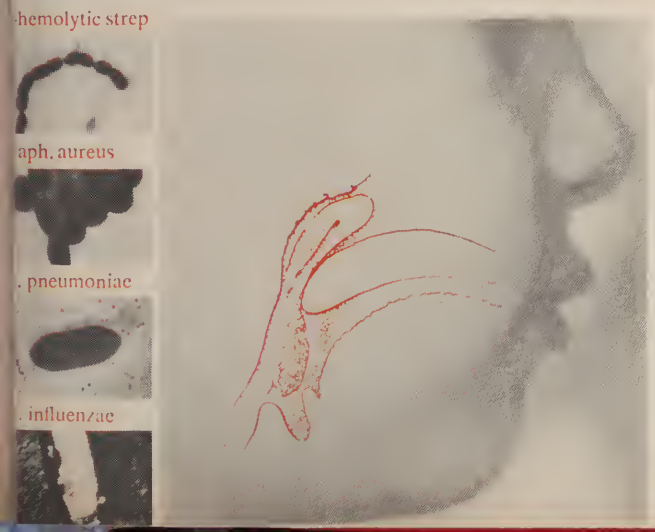
CIBA



It's easy
for children
to get bacteri
U.R.I....

and Gantanol (sulfamethoxazole) Suspension is a good way to help them get well

roven effectiveness in common bacterial upper espiratory infections

linical results in patients probably much like those you see every ıy show that an overwhelming majority responded favorably to antanol (sulfamethoxazole) Suspension.[1-12] These patients, num-ering over 1600 in published reports, had a variety of bacterial pper respiratory infections such as otitis media, sinusitis, pharyn-tis and tonsillitis, including over 700 cases caused by beta-hemo-tic streptococci.[1-7]

lthough in bacteriologically proven streptococcal infections peni-llin remains the drug of choice, Gantanol (sulfamethoxazole) has own conversion rates comparable to those generally seen with enicillin and apparently superior to those cited in the literature for rythromycin and broad-spectrum antibiotics.[1,2] Conversion rates ave ranged from a high of 96 per cent in 229 patients[2] to a low of 5 per cent in 105 cases.[3,4] When Gantanol (sulfamethoxazole) uspension is used in group A beta-hemolytic streptococcal infec-ons, it is important to continue therapy in the recommended dos-ge for at least 10 days. In addition, Gantanol (sulfamethoxazole) uspension has demonstrated antibacterial activity against *D. pneu-oniae, H. influenzae* and *Staph. aureus*. Thus Gantanol (sulfa-ethoxazole) Suspension may be considered a practical choice for ommon bacterial U.R.I., as well as an effective alternative in the enicillin-sensitive patient with proven beta-hemolytic strepto-ccal infection.

therapy generally uncomplicated by side effects

Such favorable results as those cited in the literature[1-12] are even more meaningful in view of the fact that only 27 of 1961 patients (1.4%) discontinued therapy because of side effects. Of the total side effects reported in 107 patients (5.5%), most were mild and included rash, urticaria, itching, dizziness, headache, diarrhea, nausea and vomiting, shivering sensation, skin discoloration and crystalluria.[1-12]

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Acute and chronic respiratory and urinary tract bacterial infections due to susceptible microorganisms. At present penicillin is considered the drug of choice in acute group A beta-hemolytic streptococcal infections; however, Gantanol (sulfamethoxazole) has shown an effectiveness approaching that of penicillin in a large number of patients. If employed in such infections, *it is important that therapy be continued in the usual recommended dosage for a period of at least 10 days.*

Contraindicated in sulfonamide-sensitive patients, pregnant females at term, premature infants or infants during first 3 months of life.

Warnings: Use only after critical appraisal in patients with liver damage, renal damage, urinary obstruction or blood dyscrasias. If toxic or hypersensitivity reactions or blood dyscrasias occur, discontinue therapy. In intermittent or prolonged therapy, blood counts and liver and kidney function tests should be performed. Data insufficient on prolonged or recurrent therapy in chronic renal diseases of children.

Precautions: Observe usual sulfonamide therapy precautions, including maintenance of an adequate fluid intake. Use with caution in patients with histories of allergies and/or asthma. Patients with impaired renal function should be followed closely since renal impairment may cause excessive drug accumulation. Occasional failures may occur due to resistant microorganisms. Not effective in virus or rickettsial infections.

Adverse Reactions: Following may occur: headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, Stevens-Johnson syndrome, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Dosage: Children—1 teasp./20 lbs initially, followed by ½ teasp./20 lbs b.i.d. *Adults*—4 teasp. initially, followed by 2 teasp. b.i.d. or t.i.d., depending upon severity of infection.

How Supplied: Suspension 10%, 0.5 Gm sulfamethoxazole/5 cc teasp., cherry-flavored, bottles of 16 oz.

Solutions to Business Problems in Daily Medical Practice

Telephone Techniques: Part I

WILBURN L. McCLURE, JR.

The telephone can be the single most disruptive influence to a well-planned office routine. Knowledge of proper techniques for coping with this problem can save everyone involved both precious time and wear and tear on the nervous system.

As with many non-medical responsibilities, the aide generally assumes the role of handling the job. Proper coordination is essential, though, if peace and harmony between the doctor and his staff are to remain.

The following can act as a guide toward preparing your office SOP (Standard Operating Procedures) Manual. Revise and extend each category as it best suits your office, *but* remember one thing: KEEP IT UP TO DATE!

Incoming calls from patients: "Good morning. Dr. Morrison's office. Mrs. Philips speaking."

"Hi. This Agnes Leake. May I speak with Dr. Morrison?"

"He is in the office, Mrs. Leake, but at the moment he is examining a patient. May I give him a message and have him take your call as soon as he has finished?"

"No! I want to talk to him right now, sister. Get him on the phone quick!"

"Mrs. Leake, you know I can't interrupt the doctor when he is examining a patient unless it is an absolute emergency. Is this such an emergency?"

"No, dear! I'm sorry. This is not an emergency. I do need his advice, though, right away."

"Thank you, Mrs. Leake. Please hold on."

Sound familiar? Probably. Let's examine what the aide did in the above case. She greeted the patient with a "Good morning" and identified the doctor's office as well as herself. She obtained the patient's name so that she could pull the history file if necessary. She informed the patient of the doctor's immediate status and remained firm when the demands of the patient were unreasonable. Not being able to determine the nature of the patient's problem the first time, she did not press her luck.

In most offices, inquiries similar to the one described above constitute a major portion of incoming calls. How well an aide is prepared to handle these and other inquiries concerning appointments, bills received, cancellations, hospital admission procedures, prescriptions, referrals, etc, determine her value to you and will reflect on her prestige as a professional medical assistant.

Incoming calls of a special nature: "I'm Mr. Long. How's my wife progressing with this pregnancy?"

"Hello. This is Dr. Delp. I would like to re-

fer a Mrs. Schultz for evaluation. When can Dr. Morrison see her?"

"Rev. Elson speaking. May I speak to Dr. Morrison about giving a lay sermon in June?"

"I'm Capt. Gelson. We'd like to know if Dr. Morrison can sponsor tickets for some boys to go to our Police Boys' Club picnic?"

Special calls like these require special handling, and your assistant may find that all callers are not even this helpful in describing their reasons for telephoning. One thing she will generally recognize immediately is that the caller is not a patient. When this happens, she should obtain pertinent information right away so that she will know what to tell you.

You should make clear to her how you want her to handle incoming calls concerning patient inquiries (from persons other than the patient), patient referrals (by doctors, friends and patients), solicitations, laboratory reports, pharmacies, medical societies, insurance companies and so on.

Incoming calls of a personal nature: "Hello, Mrs. Philips. This is Mrs. Morrison. What's my husband doing?"

"This is Jack Dawson, Dr. Morrison's insurance agent. He asked that I call about this time to discuss a policy."

You can probably make a long list of such calls from members of your family, from lawyers, real estate agents, securities brokers, bankers and the like. Many important personal, as well as business discussions are handled through such calls and, as your ambassador, your assistant should know how you want them processed.

Woman's Auxiliary
MARYLAND
HYGEIA FILIAE
W A M C F

FEBRUARY, 1967

MRS. HARRY L. BERMAN, *Editor*

ALLEGANY COUNTY

Mrs. Robert Dawson, chairman of Health Careers, and her committee have been busy renewing subscriptions to *Today's Health* and replenishing supplies of health careers material, from the American Medical Association and other sources, for nine high schools. The committee is also planning a program to enable students interested in one of the health fields to observe in action those whose careers they would like to emulate.

Students from the American Field Service were guest speakers at the January meeting of the Auxiliary.

The wives of members of the Allegany County Bar Association will be invited to the March meeting of the Auxiliary, at which Carolyn Pincock, MD, will be guest speaker.

BALTIMORE CITY

Mrs. Percy H. Sutley, president of the Auxiliary, has announced that its annual fund-raising luncheon and fashion show will be held at the Greenspring Inn Club on March 6. Reservations are limited and should be made as soon as possible through the Auxiliary treasurer, Mrs. Sullins G. Sullivan, 419 Oak Lane, Baltimore, Md. 21204. Tickets are $5.50 each.

Festivities will begin with a social hour at 11:30 AM. Luncheon will be served at 12:30 PM and the fashion show will start at 1:30 PM. Women's Fashions will come from Octavia of the Village of Cross Keys, children's from the Pied Piper. Furs will be provided by Auman and Werkmeister of North Charles Street, shoes by Hahn's and coiffures by Umberto Salon of Beauty.

Other features of the event will include a raffle, boutique tables, cheer baskets and door prizes.

MONTGOMERY COUNTY

For the seventh consecutive year, the Auxiliary has sponsored two fellowship awards which it presents to the Montgomery County Tuberculosis and Heart Association for use by high school students selected by competitive examination following a lecture series. This year 700 students have enrolled for the lectures. Ten to twelve awards will be given to those who rank highest in the examination, which is optional.

The students who receive the fellowship grants will engage in summer work at the National Institutes of Health and the National Naval Medical Center during a seven-week period beginning in June.

PRINCE GEORGE'S COUNTY

The Auxiliary raised funds for a local nursing scholarship at the annual White Elephant auction in January. Mrs. George Malouf was chairman of the project.

WASHINGTON COUNTY

The Safety Committee is planning a campaign for motorcycle safety, with cash prizes to be awarded for the best poster in each of the high schools and a grand prize to be awarded for the best in the county. The posters will be displayed throughout the area at the end of March.

TABLETS

Equagesic®

(meprobamate and ethoheptazine citrate with aspirin)

Wyeth®

Precautions: Keep out of reach of children. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use of meprobamate may result in dependence or habituation in susceptible persons—as ex-addicts, alcoholics, severe psychoneurotics. Withdraw gradually after prolonged high dosage to avoid possibly severe withdrawal reactions including epileptiform seizures. Warn patients of possible reduced alcohol tolerance. If drowsiness, ataxia or visual disturbances occur, reduce dose. If symptoms persist, caution patients against operating machinery or driving. Give cautiously to patients with suicidal tendencies. Treat attempted sulcide with immediate gastric lavage and appropriate supportive therapy

Side Effects: Ethoheptazine and aspirin may occasionally cause nausea, vomiting, epigastric distress, and rarely dizziness and CNS depression. Overdosage may result in salicylate intoxication. Meprobamate rarely causes allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever have been reported. Meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioedema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. A few cases of leukopenia, usually transient, have been reported following prolonged dosage. Rarely, cases of aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis, and hemolytic anemia have been reported; almost always, in the presence of known toxic agents.

Contraindications: History of sensitivity or severe intolerance to aspirin or meprobamate.

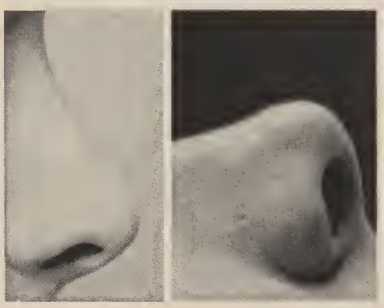
Composition: 150 mg. meprobamate, 75 mg. ethoheptazine citrate and 250 mg. aspirin per tablet.

Wyeth Laboratories Philadelphia, Pa.

Weighing on his mind, too

When pain evokes anxiety and tension, thereby heightening patient discomfort, a simple analgesic may only touch on part of the problem.

This single-prescription, nonnarcotic product, however, usually provides effective analgesia *and* helps put the patient's mind at ease.



One 'Ornade' Spansule Capsule works all day (or all night) to make your patient with a cold a lot more comfortable.

'Ornade', the unique oral nasal decongestant with a drying agent, a decongestant and an antihistamine in the ideal dosage form

Ornade® Spansule® Capsules

Trademark brand of sustained release capsules

ALL-DAY OR ALL-NIGHT RELIEF

Each capsule contains 8 mg. of Teldrin® (brand of chlorpheniramine maleate), 50 mg. of phenylpropanolamine hydrochloride, and 2.5 mg. of isopropamide, as the iodide.

The following is a brief precautionary statement. Before prescribing, the physician should be familiar with the complete prescribing information in SK&F literature or *PDR*. *Contraindications:* Patients with glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloroduodenal obstruction, or bladder neck obstruction. *Precautions:* Use with caution in the presence of hypertension, hyperthyroidism, or coronary artery disease; and, in patients who may operate vehicles or machinery, warn of possible drowsiness. *Note:* Since the iodine in isopropamide iodide may alter PBI test results and will suppress I^{131} uptake, it is suggested that 'Ornade' be discontinued one week before these tests. *Side effects:* Drowsiness; excessive dryness of nose, throat, or mouth; nervousness; or insomnia may occur rarely, but are usually mild and transitory. Other known possible side effects of the individual ingredients are: nausea, vomiting, diarrhea, rash, dizziness, fatigue, tightness of chest, abdominal pain, irritability, tachycardia, headache, and difficulty in urination.

Appraisal of Rare Books

Since the appearance of the last LIBRARY PAGE in the December issue of THE JOURNAL, a significant step has been taken in the development of the Med-Chi Library. As the result of a decision by the Library Committee at its November meeting, Mr. Lee Ash, well-known library consultant and authority on rare medical books, was invited to make a preliminary survey of the Library collection with the eventual aims of appraising the rare books and recommending the best method of disposition of duplicates and obsolete textbooks. Recently, several medical school libararies have realized as much as $70,000 from the sale of such items!

In January, Mr. Ash spent two days looking over our shelves and in a very short time spotted quite a few titles of value. Some of these were on the open stack shelves, since our present "Rare Book Room" is about the size of an enlarged coat closet and extremely inadequate.

For some time it has been the desire of the Library Committee, and other interested members of the Faculty, to establish a Rare Book Room. Such a room should provide not only the necessary space to accommodate the collection, but also protection against fire and theft and the correct environment for the preservation of rare bindings and papers. In addition, there should be a reading area for study and research, as well as office and work space.

Library Personnel

In as much as medical librarians, along with all other special librarians, are very scarce, it behooves all of us interested in recruiting new personnel for the field to encourage any young persons with an aptitude for the profession. Career information is available from the Medical Library Association, 919 North Michigan Avenue, Chicago, Illinois, 60611, or from this Library.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

Let's get
down to earth
about
diuretics

With Hygroton, you'll discover that you can almost always use fewer tablets than is possible with other diuretics.

You may be told that a new short-acting diuretic was found more effective than Hygroton in congestive heart failure—but this was when twice the manufacturer's maximum recommended dose was given.* At the maximum recommended dose for both diuretics, two tablets of Hygroton were far and away more effective than five tablets of the other diuretic in producing natruresis and weight loss. And at these dosages, Hygroton costs only ⅓ as much as the other diuretic.

Since the discovery of chlorothiazide, the trend has been away from short-acting, multiple-dose, high-cost diuretics. With Hygroton you can usually do the job with just one tablet a day, or every other day.

More than any of the newer diuretics, Hygroton brings dosage and cost of medication down to earth.

*Brest, A. N., et al.:J. New Drugs 5:329, 1965.

Hygroton®
chlorthalidone

Indications: Hypertension and many types of edema involving retention of salt and water. **Contraindications:** Hypersensitivity and most cases of severe renal or hepatic disease. **Warning:** With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind. **Precautions:** Reduce dosage of concomitant antihypertensive agents by at least one-half. Discontinue if the BUN rises or liver dysfunction is aggravated. Electrolyte imbalance and potassium depletion may occur; take special care in cirrhosis or severe ischemic heart disease, and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. **Side Effects:** Dizziness, weakness, nausea, vomiting, hyperglycemia, hyperuricemia, headache, muscle cramps, postural hypotension, constipation, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin reactions, including urticaria and purpura, epigastric pain, or G.I. symptoms after prolonged administration. **Average Dosage:** One tablet (100 mg.) with breakfast daily or every other day. **Availability:** Tablets of 100 mg. in bottles of 100 and 1000. For full details, see the complete prescribing information. 6524-V(B)

Geigy

fluocinolone acetonide — an original steroid from

SYNTEX

LABORATORIES INC., PALO ALTO, CALIF.

controls infected inflammatory dermatoses that start from scratch

Neo-Synalar®
(fluocinolone acetonide-neomycin sulfate cream)
Cream

The "itch-scratch" cycle usually associated with inflammation often results in infected dermatoses because broken skin surfaces are particularly vulnerable to pathogenic bacteria.[1] To treat infected inflammatory dermatoses, Neo-Synalar Cream combines the most active topical corticosteroid with a highly reliable antibiotic generally reserved for topical application.

In Neo-Synalar, fluocinoline acetonide controls the inflammation and provides rapid relief from associated pruritus. At the same time, its antibacterial component—neomycin—combats superficial infection caused by many gram-positive and gram-negative bacilli[2] that often colonize and thrive on abraded skin.[1]

A specially formulated vanishing cream base that is greaseless and odor free makes Neo-Synalar cosmetically appealing, and encourages greater patient cooperation.

controls the infection

stops the scratch

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of its components. **Precautions:** Neomycin rarely produces allergic reactions. Prolonged use of any antibiotic may result in overgrowth of nonsusceptible organisms; if this occurs, appropriate therapy should be instituted. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. **Side Effects:** Side effects are not ordinarily encountered with topical corticosteroids. As with all drugs, however, a few patients may react unfavorably to Neo-Synalar under certain conditions. **Availability:** Neo-Synalar Cream (0.025% fluocinolone acetonide, neomycin sulfate, equivalent to 0.35% neomycin base), 5 and 15 Gm. tubes.

Chest Pain: a somatic mask of psychic tension?

"Heart symptoms"—chest pain, tachycardia, arrhythmia—invariably alarm and preoccupy the patient, though they may be completely without organic basis. Such symptoms often are somatic masks of psychic tension, arising from constant encounters with stressful situations.

When the problem is diagnosed as emotionally produced, consider Valium (diazepam) as adjunctive therapy. Valium (diazepam) acts rapidly to calm the patient, to reduce his psychic tension and relieve associated cardiovascular complaints.

NEUROTIC FATIGUE—the chronic tiredness resulting from emotional strain which so often accompanies psychogenic "heart" symptoms—also can be alleviated by this highly useful agent. Valium (diazepam) often achieves results where other psychotherapeutic agents have failed.

Valium (diazepam) is generally well tolerated, and usually does not impair mental acuity or ability to function. If side effects such as ataxia and drowsiness occur, they usually disappear with dosage adjustment.

Contraindications: Infants, patients with history of convulsive disorders or glaucoma.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly patients (not more than 1 mg, one or two times daily) to preclude ataxia or oversedation. Advise patients against possibly hazardous procedures until correct maintenance dosage is established; driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. Warn patients of possible combined effects with alcohol. Safe use in pregnancy not established. Observe usual precautions in impaired renal or hepatic function and in patients who may be suicidal; periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances and hallucinations) and changes in EEG patterns. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage — Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hrs, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed.

Supplied: Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 for convenience and economy in prescribing.

Brewer Diagnostic Kits

Complete Serological Screening Tests For Syphilis . . .

The RPR Card Tests make use of a specially prepared, carbon-containing RPR Card antigen. The particle size and other characteristics of the carbon is such that when a reactive specimen is encountered, flocculation occurs, and there is a coagglutination which is readily visible to the naked eye. Individual tests, including the collection of blood and separation of plasma can be performed in 7 to 8 minutes.

Confirming earlier findings with the RPR Card Test[1-10] Reed[11] in reporting on 63,800 specimens had an overall agreement of 98.5% in a recent comparative study with other routine screening procedures.

The RPR Card Tests, with their low cost, ease of performance, high sensitivity and specificity, are without peer in situations that demand rapid testing of patients, enabling the physician to initiate prompt treatment of early infectious syphilis.

Specify the RPR Card Test as the screening procedure on serum or plasma samples submitted to your State Approved Laboratory.

When the stagnant sinus must be drained...

Transillumination of the sinuses—diffuse shadow on right side of face indicates unilateral maxillary sinusitis.

In the common cold, Neo-Synephrine is unsurpassed for reducing nasal turgescence. It stops the stuffy feeling at once. It opens sinus ostia to re-establish drainage and lessen the chance of sinusitis. With Neo-Synephrine, in the concentrations most commonly used, decongestion lasts long enough for extended breathing comfort, without endangering delicate respiratory tissue. Systemic side effects are virtually unknown. There is little rebound tendency.

Winthrop Laboratories, New York, N.Y. 10016 Winthrop

Neo-Synephrine® HCl

Brand of phenylephrine hydrochloride

is available in a variety of forms, for all ages:

- ⅛% solution for infants
- ¼% solution for children and adults
- ¼% pediatric nasal spray for children
- ½% solution for adults
- ½% nasal spray for adults
- ½% jelly for children and adults
- 1% solution for adults (resistant cases)

Also NTZ® Solution or Spray
Antihistamine-decongestant

What you should know about
CONSOLIDATED MEDICAL SERVICES

What is it?

Consolidated Services is an operation designed to pay the physician's fees immediately through centralized billing and collection, thus permitting him and his staff to devote complete attention to the performance of physician services. Consolidated Services is owned and operated by a group of prominent doctors and businessmen, and is governed in accordance with strict ethical standards by a committee of investor/participants.

How does it work?

At a billing time convenient to the physician, he provides his receptionist with patients' names, services rendered, and fees due. Using a touch-tone card dialer, supplied and installed by Consolidated Services, the receptionist transmits the data to the central office, by means of pre-punched cards employing a numerical code. The transmission is completed in seconds . . . and one week from billing date, Consolidated remits fully to the physician, less a modest discount. The touch-tone card dialer is used as your regular office telephone; no other telephones are necessary with this unit. Pre-punched cards are supplied at no cost.

How does the physician benefit?

Billing by Consolidated Services places the physician on an immediate full cash basis. For example, if a physician bills $5000 on September 1, research states that only 40 to 50 per cent will be collected that month, resulting in $2500 cash on hand and $2500 remaining in accounts receivable. But when using Consolidated Services, the physician collects the full $5000 within a week, in addition to eliminating costly billing, stationery, postage, and clerical time. Conservative investment of the additional $2500 collected would virtually cover the modest cost of the service.

What about payment plans?

Consolidated offers five different plans:

Basic Billing on physician's choice of personal statement or third party bill head. Patient has option of 90 day payment at no extra charge.

Patient Option Plan I. Straight six-month plan, 1% per month service charge on declining balance.

Patient Option Plan II. Twelve-month plan, service charge 1½% per month.

Professional Option Plan III. Six month; no service charge to patient. 1% flat charge to physician, plus discount.

Professional Option Plan IV. Twelve month; no service charge to patient. Physician pays 2% flat charge, plus discount.

How much will it cost me?

Consolidated applies a service charge of 5 to 7% dependent upon size and volume of the practice. This is in the form of a discount on remittances; for example, if Dr. Jones reports patients' fee amounting to $100, he receives a check for $93 or more within a week. There are no hidden costs in Consolidated's program. All costs for installation of touch-tone dialer, patient data cards, forms, reports, etc., are absorbed by Consolidated Services.

How can I become a participant?

By calling our Executive/Control Offices, 486-4984/8935 and requesting an appointment. We will be pleased to serve you promptly.

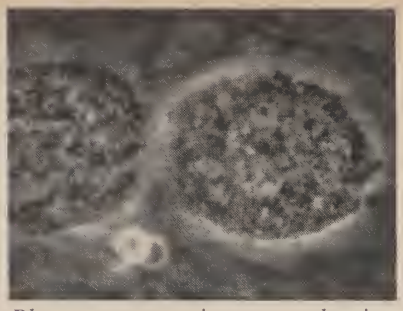
INFLAMMATION:
A cellular fight for life

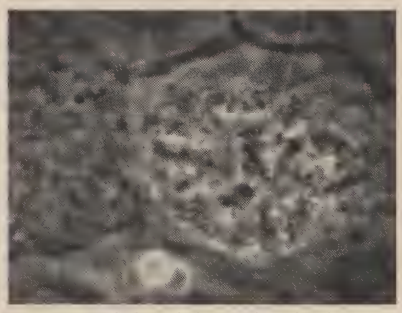
A SYNTEX REPORT based on recently developed hypotheses about topical corticosteroids, including the cellular theories of inflammation by Thomas F. Dougherty, Ph.D., University of Utah.

You are looking at a fibroblast fighting for life. This cell—one of the most common found in connective tissue—has literally been poisoned by cytotoxins released from other cells that have ruptured. Soon, if the abnormal activity of this fibroblast does not cease, it, too, will rupture and die—one more casualty in the inflammatory wave of destruction precipitated by injury.

Until a short time ago no one had ever witnessed such a scene at the cellular level. Now, through advanced cinemicrographic techniques, it is possible to view and photograph the inflammatory process as produced experimentally in living animal tissue. This method permits new insight into the mechanism of inflammation and the role of corticosteroids in therapeutic management. Equally important, these techniques shed new light on factors that may make one corticosteroid more effective than another—factors that can be correlated with other chemical, biologic, and clinical parameters.



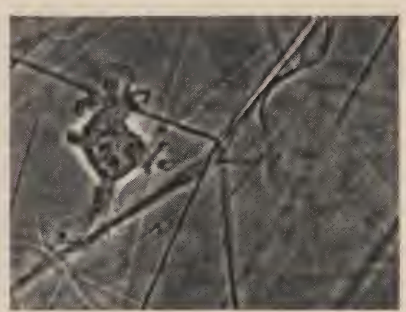
Visual evidence of how corticosteroids influence the inflammatory reaction



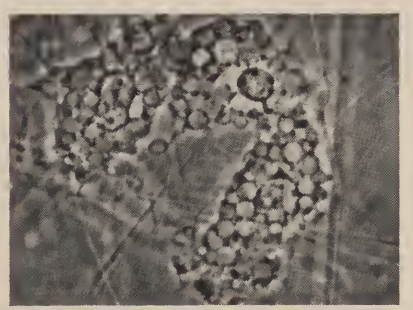
Working with phase-contrast cinemicrography on living animal tissue, Doctors Thomas F. Dougherty and David Berliner of the University of Utah College of Medicine have actually filmed cellular events that occur during the inflammatory reaction. This remarkable study* and additional work by these investigators, as well as by others, have established a new theoretical biologic basis for the antiinflammatory effect of the corticosteroids. (It must be noted that other theories, such as the lysosome or so-called "suicide bag" theory, have been postulated, although it is quite likely that there are more similarities than differences among the various theoretical models.)

The inflammatory wave of destruction

In this investigation an injurious injection of gelatin is used to set off an inflammatory reaction in living mouse tissue. What follows is a wave of destructive cellular activity that comprises the inflammatory response to injury. Mast cells (which contain heparin, serotonin and histamine) take up water, swell and rupture, releasing their contents, which are toxic outside the mast cell wall. These toxins, in turn, cause disintegration of other cells (such as fibroblasts) and the release of additional toxic material. Capillaries, too, take up water and leak unformed blood elements, causing edema. And polymorphonuclears, lymphocytes and perithelial cells invade the inflamed site. As a result of all these changes, the cellular environment reaches a state of turmoil.

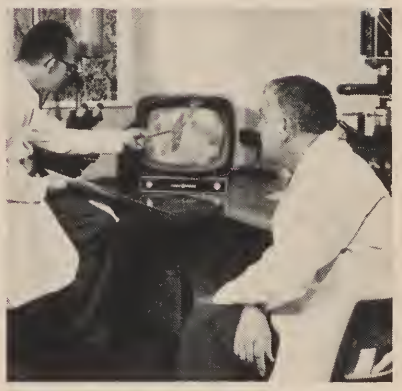


Phase-contrast microscopy showing mast cell before injury.



Mast cell (after injury) has broken up and released cytotoxins.

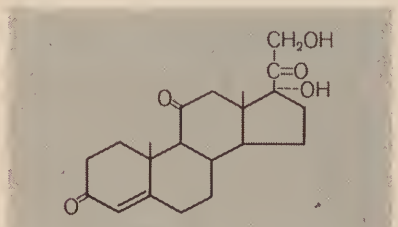
How corticosteroids change the picture



Corticosteroids appear to virtually stop the abnormal cellular activity that constitutes the inflammatory reaction. This permits the body's natural resources to clear up the inflamed area and repair the damaged tissue. This interpretation is supported by the fact that when the injurious gelatin solution is injected simultaneously with a corticosteroid —Synalar (fluocinolone acetonide)— the inflammatory pattern simply does not develop.

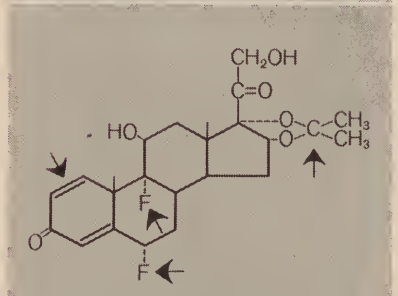
Fibroblast in high state of activity, much distorted.

Mast cells showing effects of corticosteroid action: cells are normal in size, shape and activity.



In summarizing his study Doctor Dougherty states: "...we also feel this work may explain why one corticosteroid helps a patient more rapidly and effectively than another. If it does, it is because one corticosteroid is the fastest, most effective inhibitor of the series of inflammatory events at the tissue level."

**A New View of Corticosteroid Action in Inflammatory Dermatoses,* a film based on this study, is now available from your Syntex representative.

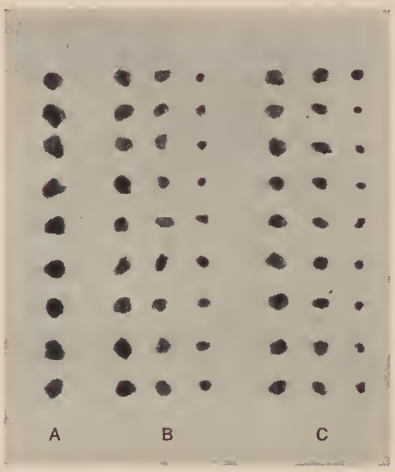


See last page for contraindications, precautions, side effects and dosage.

How advances in chemical design have achieved greater steroid potency

The chemical modification of corticosteroid molecules from the advent of hydrocortisone to the development of Synalar (fluocinolone acetonide) is a prime example of how biochemists can "design" to increase therapeutic activity and minimize undesirable side actions. Below, for example, we see the important changes that were made in reference to the hydrocortisone molecule to produce fluocinolone acetonide, one of the most active of all topical corticosteroids. As a result, a 0.01% preparation of Synalar (fluocinolone acetonide) has been reported to do the work of a 1% hydrocortisone product containing 100 times more cortiscosteroid. And it can often do it more effectively.

Hydrocortisone



Fluocinolone Acetonide (Synalar)

- *a double bond between carbons 1 and 2*
- *fluorine substitutions at* both *the 6-α, and the 9-α positions*
- *the addition of the acetonide at the 16-α, 17-α positions, thus providing one of the most potent topical corticosteroids available.*

How bioassay tests are used to "predict" therapeutic potential

Biologic assays are another tool used by researchers to help establish the relative activity of corticosteroids. To date no single method of assaying corticosteroid activity has emerged as the ideal "yardstick" for predicting therapeutic potential. Taken together, however, these methods have proved useful. When such tests are run on various corticosteroids, a definite order of corticosteroid activity becomes evident. Compounds with the highest order of activity may be expected to merit clinical trial to establish their high therapeutic potential. When assayed by these methods, fluocinolone acetonide (Synalar) emerges as one of the most active topical corticosteroids, milligram for milligram, available for clinical application today.

THE THYMUS INVOLUTION ASSAY[1-4] is run on adrenalectomized rats. The sizes of the glands are measured, and the degree of involution caused by the steroid is determined as an indication of its potency. In the above photo, the comparative involution of thymus glands achieved with hydrocortisone and Synalar (fluocinolone acetonide) is shown. Untreated controls (A) show normal size. Group B – injected with 1, 2 and 4 mg. of hydrocortisone – show progressively smaller thymuses as does Group C – injected with fluocinolone acetonide – but with only 1/500th the dose of hydrocortisone.

THE ANTIGRANULOMA ASSAY[1-4] also utilizes adrenalectomized rats. Granulomas are induced by subcutaneous implantation of cotton pellets on either side of the thorax. The degree of granuloma inhibition achieved by a steroid reflects its potency. The above photo shows the inhibition of granuloma formation achieved with hydrocortisone and Synalar (fluocinolone acetonide). Untreated controls (A) show large, red granulomas adhering to the pellets. Group B, receiving hydrocortisone and Group C, receiving fluocinolone acetonide, show little, if any, granuloma formation. Fluocinolone acetonide produced the same effect as hydrocortisone with only 1/500th the dose. This assay, as well as the thymus involution assay, measures systemic rather than topical corticosteroid activity. Nevertheless, results by these methods correlate well with other assays and with the milligram potencies of topical steroids in current clinical use.

Worldwide clinical experience confirms the predictable therapeutic potential of Synalar

It is particularly gratifying that the promise of the advanced chemical design and high order of bioassay activity of Synalar (fluocinolone acetonide) has been confirmed by widespread therapeutic application. Indeed, the impressive clinical response rate of Synalar has been documented in no fewer than 232 papers from 22 countries.

Representative Clinical Results with Synalar*

Efficacy Documented in over 4,000 Patients

Condition	Number of Publications	Number of Patients	Significant Improvement†
Contact Dermatitis	27	750	713
Eczematous Dermatitis	21	472	409
Seborrheic Dermatitis	18	442	426
Atopic Dermatitis	24	460	426
Psoriasis	36	1,699	1,510
Neurodermatitis	18	351	324
Total	144	4,174	3,808

*Complete bibliography on request.

†Expressed by the authors as excellent, very good, good, complete remission of inflammation, etc.

PRESCRIBING INFORMATION

For initiation of therapy: Cream 0.025%, 5 and 15 Gm. tubes, 425 Gm. jars; *for emollient effect:* Ointment 0.025%, 15 Gm. tubes; *for maintenance therapy:* Cream 0.01%, 15 and 45 Gm. tubes, 120 Gm. jars; *for intertriginous or hairy sites:* Solution 0.01%, 20 cc. and 60 cc. plastic squeeze bottles; *for infected inflammatory dermatoses:* Neo-Synalar® Cream (0.025% fluocinolone acetonide, neomycin sulfate, equivalent to 0.35% neomycin base), 5 and 15 Gm. tubes.

CONTRAINDICATIONS: Tuberculous, fungal, and most viral lesions of the skin, (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components. PRECAUTIONS: Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. Prolonged use of any antibiotic may result in overgrowth of nonsusceptible organisms; if this occurs, appropriate therapy should be instituted. When severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. SIDE EFFECTS: Side effects are not ordinarily encountered with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. The neomycin in Neo-Synalar Cream rarely produces allergic reactions.

LOOK TO THE ULTIMATE IN NURSING HOMES

What makes Community Health Facilities *different and better* than other nursing homes in Maryland? The main reason they stand out from all the other homes is that these eight health institutions are made up of skilled people whose entire lives are devoted to the profession of helping others. These pepole are interested concerned and thoroughly conscientious regarding every guest they have. At a Community Health Facility, each and every guest receives personalized individual care that guarantees them a pleasant stay whether they are receiving convalescing or restorative long term rehabilitative care.

COMMUNITY HEALTH FACILITIES FEATURE:

- Registered Nurses—24 hour nursing care
- Open medical staff—your doctor continues to care for you
- Special diets under the supervision of an Accredited Dietician
- Modern hospital equipment—Oxygen, Intravenous, Suction Therapy
- Physical Therapy Available
- Air Conditioning Available
- Religious Services
- Recreational Areas
- Separate Units provide separation of convalescent from sicker patient
- True convalescent section—Intensive are Unit
- And *best of all . . . attractive and sensible rates*

ANNUAL MEETING

The Faculty's Annual Meeting is scheduled for:

WEDNESDAY, THURSDAY, AND FRIDAY, APRIL 19, 20 and 21

The House of Delegates' sessions are on:

Wednesday, 9:30 a.m., The Alcazar

Friday, 2:00 p.m., Faculty Building

The Annual Presidential Dinner is scheduled for:

Thursday, 6:30 p.m., The Sheraton-Belvedere Hotel

Hotel reservations may be made at the Belvedere from the block of 50 rooms set aside for the Faculty's use. Reservation blank in this issue of the Journal.

REFERENCE COMMITTEE MEETING

Reference Committee meeting is set for Wednesday, March 29, at 8:00 p.m., in the Faculty Building.

Five resolutions are to be considered that night and recommendations developed for presentation to the House of Delegates on Friday, April 21, at 2:00 p.m.

GENERAL MEETING

The General Meeting for election of two members of the Board of Medical Examiners will be held on Thursday, April 20, at 12 Noon at the Alcazar.

A complete list of nominations is available to members through the Faculty office.

NOTICE

The newly formed Maryland Urological Society will meet on April 19, at 5 p.m. at the University Club. For further information, call Dr. John Hogan, 685-8676.

NEWS NOTES

Harry M. Robinson, Jr., M.D., Baltimore, has been reappointed a member of the Subcommittee on Skin of the AMA's Committee on Rating of Mental and Physical Impairment.

Russell S. Fisher, M.D., Baltimore, has been renamed to the Chairmanship of the Committee on Medicolegal Problems of the AMA.

Paul J. Schmidt, M.D., Bethesda, has been reappointed a consultant to the Committee on Blood of the AMA.

Abraham J. Mirkin, M.D., Cumberland, has been redesignated as a member of the Committee on Medical Aspects of Automotive Safety of the AMA.

John J. Curry, M.D., Silver Spring, has been reappointed to membership on the AMA's Council on Drugs.

RADIOLOGY FELLOW

Donald A. Wolfel, M.D., Baltimore, was inducted as a Fellow of the American College of Radiology, in Chicago.

ANESTHESIA FELLOWS

New Fellows of the American College of Anesthesiology are: Edwin J. Goldman, M.D., Baltimore; and Carl A. Meyer, Jr., M.D., Silver Spring.

ELECTION

William Carl Ebeling, M.D., was elected President of the Medical and Dental Staff of Bon Secours Hospital at the recent meeting of that group.

STROKE PROGRAM OFFICE

The Heart Association of Maryland has established a Stroke Program office to develop needed information services and demonstration programs for physicians and their patients. It will also establish a Strokes registry to provide Maryland with a central source of information concerning the number of patients, their needs, and what happens to them.

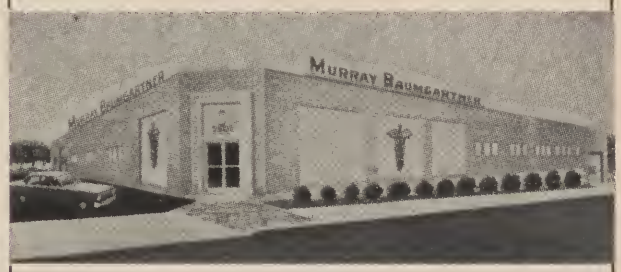
Featherlite
Contour-Shaped
Surgical Two-Way



SEAMLESS ELASTIC HOSIERY

Now! . . . a new concept in elastic hosiery achieves excellent cosmetic effect and provides the necessary therapeutic qualities of surgical weight. Using a patented inlay method to insure proper lateral support, fine gauge nylon-covered rubber thread is knitted with MAGILOFT (stretch nylon) yarn to produce a lightweight elastic two-way stretch stocking highly resistant to runs and snags.

For the FIRST time in this field, both STOCK and SPECIALS are available; thus you may offer your patients complete selection of elastic two-way stretch stockings with proper compression, regardless of size or shape.

The Contour-Shape, combined with a MAGILOFT SOFT TOP and knitted-in heel, has eliminated wrinkles at ankle and all tendency to slip down at the top.

The SUPPORT of surgical weight is retained with the advantages of light weight, and all the desirable features of fine gage hosiery.

Serving the Medical Profession for Almost Half a Century

"George wants to know if it's okay to take his cold medicine now, Doctor, instead of seven o'clock?"

The long-continued action of Novahistine LP should help you both get a good night's sleep. Two tablets in the morning and two in the evening will usually provide round-the-clock relief by helping clear congested air passages for freer breathing. Novahistine LP also helps restore normal mucus secretion and ciliary activity—normal physiologic defenses against infection of the respiratory tract. Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result. Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

'Thorazine' is useful as a specific adjuvant in the above named conditions.

The following is a brief precautionary statement. Before prescribing, the physician should be familiar with the complete prescribing information in SK&F literature or *PDR*. *Contraindications:* Comatose states or the presence of large amounts of C.N.S. depressants. *Precautions:* Potentiation of C.N.S. depressants may occur (reduce dosage of C.N.S. depressants when used concomitantly). Antiemetic effect may mask other conditions. Possibility of drowsiness should be borne in mind for patients who drive cars, etc. In pregnancy, use only when necessary to the welfare of the patient. *Side Effects:* Occasionally transitory drowsiness; dry mouth; nasal congestion; constipation; amenorrhea; mild fever; hypotensive effects, sometimes severe with I.M. administration; epinephrine effects may be reversed; dermatological reactions; parkinsonism-like symptoms on high dosage (in rare instances, may persist); weight gain; miosis; lactation and moderate breast engorgement (in females on high dosages); and less frequently cholestatic jaundice. Side effects occurring rarely include: mydriasis; agranulocytosis; skin pigmentation, lenticular and corneal deposits (after prolonged substantial dosages).

For a comprehensive presentation of 'Thorazine' prescribing information and side effects reported with phenothiazine derivatives, please refer to SK&F literature or *PDR*.

Smith Kline & French Laboratories SK&F

From Washington

The Johnson administration's health legislation program this year includes proposals to expand medicare and limit medicaid, and more money is being requested for most federal activities in the health field.

President Johnson also has asked Congress for anti-air pollution legislation and stricter anti-water measures.

The President termed medicare "an unqualified success," but added "there are improvements which can be made and shortcomings which need prompt attention." He proposed that the 1.5 million disabled persons receiving other Social Security and railroad retirement benefits also be included under medicare. He said "certain types of podiatry" should be included in medicare benefits. He further directed the Secretary of Health, Education, and Welfare "to undertake immediately a comprehensive study of the problems of including drugs under medicare."

Johnson noted that only 415,000, less than half of the 850,000 total, of nursing home beds in the nation met federal standards and that only 3,000 of the total of 20,000 nursing homes had qualified under medicare. To move toward correcting this situation, he wants more money for more health facilities and better health care institutions for the aged.

The President called for extension of existing legislation to improve state and local health planning for the elderly and to launch special pilot projects to bring comprehensive medical and rehabilitation services to the aged.

As for limiting medicaid (Title XIX of Social Security), Johnson said that a state should not be permitted to have its income ceilings for medical assistance more than 50% higher than the level set for welfare assistance. The medicaid program, which now gives states carte blanche as to income standards, became the subject of widespread controversy after New York set an eligibility standard of $6,000 net income for a family of four.

Twenty-eight states and jurisdictions had medicaid programs by Jan 1, 1967, and it is estimated that 30 will have them by July 1, 1967, and 48 by July, 1968. Title XIX programs replace the medical vendor payment part of existing federal-state welfare programs, including Kerr-Mills.

The administration's fiscal 1968 budget calls for general fund expenditures of $11.7 billion for carrying out existing and proposed new programs of the Department of Health, Education, and Welfare (HEW). This is an increase of $1 billion over current year spending. In addition to the general fund outlays on behalf of HEW, the budget forecasts benefit payment and administrative expenditures in 1968 from Social Security trust funds in the amount of $31 billion, an increase of $5.5 billion over 1967.

Health program highlights of the HEW budget include a 5% increase, to $1.45 billion, for medical research, and a 6% increase, to $68 million, for the Food and Drug Administration (FDA). The $4 million increase in the FDA budget will be used to: (1) expedite the review and surveillance of new drugs for safety and efficacy, (2) expand extramural research into the side effects of oral contraceptives, (3) expand the program established under last year's Drug Abuse Control Amendments, and (4) carry out the new Fair Packaging and Labelling Act. The 1968 budget will also emphasize regulation of barbiturates, amphetamines, and other drugs affecting the central nervous system, and a step-up in FDA's food standards program.

The budget for Regional Medical Programs is $16 million.

It is expected that grants will be awarded to regional groups in 1968 primarily to support a rapid expansion throughout the nation of operational activities begun during 1967, and an expansion and supplementation of planning activities begun in 1966. Emphasis will be on regional planning and coordination of medical resources, continuing education for doctors and other medi-

A monthly summary of Washington news prepared in the Washington, DC, office of the American Medical Association.

Only JOBST supports are custom made from precise measurements of the individual extremity.

JOBST Service Centers:
818 Eighteenth St., N.W.
Washington, D.C. 20006 — Ph. 298-5530
Suite 415 Medical Arts Building
101 W. Read St., Baltimore, Md. — Ph. 539-0560

When the patient's extremity is carefully measured with the unique JOBST Measuring Tape, it marks the second step toward providing him with a custom-made VENOUS PRESSURE GRADIENT support. The first step begins with a prescription. Your prescription. With your diagnosis and indication for the correct counter pressures to be engineered into the support. JOBST supports are widely used in treatment of stasis dermatitis, postmastectomy lymphedema, postural hypotension, post-fracture, post-operative and injury edema. Trained experts will measure and fit your patients for you at one of our convenient Service Centers.

cal personnel, and the rapid distribution of new knowledge and techniques.

The total Children's Bureau budget request for fiscal year 1968 is almost $246 million, an increase of about 5%, or about $11 million, over 1967. The largest share of the approximately $11 million increase is $5 million additional for special project grants for health of school and pre-school children.

New clinical studies are being permitted with DMSO (dimethyl sulfoxide) under guidelines established to provide the maximum protection possible for patients receiving the drug.

James L. Goddard, MD, Commissioner of Food and Drugs, said: "A comprehensive evaluation of all data available to us on DMSO has been completed. Indications that the drug may be of value in treating certain conditions justify further clinical investigations."

He warned, however, that these trials must be carefully planned and controlled.

"Serious toxic signs are observed in animals used in DMSO experiments," Dr. Goddard said. "Since these effects vary considerably among different species, it is possible that the drug could be less toxic in humans. But this cannot be taken for granted."

Occurrences of eye changes in DMSO-treated animals led the Food and Drug Administration to suspend clinical trials with the drug a year ago.

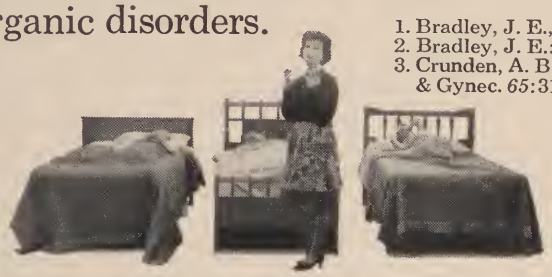
The Army and Navy will draft 2,118 medical doctors and 111 osteopaths starting in July.

The Defense Department said Selective Service was requested to provide the doctors because an insufficient number had volunteered to be able to replace men leaving service after two years' active duty. The Air Force is meeting its need and will not participate in the summer draft call. Of the 2,229 doctors to be drafted, 1,537 will go on duty in the Army and 692 in the Navy.



Last April, the Armed Forces issued new regulations under which doctors of osteopathy who volunteered for service could be commissioned. The Pentagon said fewer than a dozen had volunteered, however.

From Dallas

Four of the world's leading medical authorities on obesity met in a seminar on February 6 to discuss what a Swiss investigator has termed "an overlooked but immensely serious disease that is more common than the cold and perhaps a far greater contributor to man's unhappiness and loss of life than even cancer."

This statement, quoted by Jean Mayer, MD, director of the Department of Nutrition at Harvard University's School of Public Health, marked the opening of the Strasenburgh Obesity Seminar in Dallas.

Dr. Mayer holds a PhD in physiological chemistry from Yale University and a doctor of science degree from Sorbonne University. He had previously been affiliated with the United Nation's Food and Agriculture Organization.

In his discussion, Dr. Mayer placed particular emphasis on the physiology of obesity and the sensation of hunger. He said, "Among obese subjects, abnormalities in satiety or satisfaction may be much more common than abnormalities in hunger.

"Despite folklore to the contrary, research seems to indicate that obese subjects miss breakfast, lunch or dinner *more* frequently than the non-obese; they eat sweet desserts *less* often; but they *more* often clear their plates and tend to eat *more* snacks in the absence of hunger sensations.

"However," Dr. Mayer cautioned, "it is at the end of meals that obese subjects differ most from non-obese. They require more will-power to stop eating, even though they report more frequent sensations of discomfort at the end of meals. The obese are frequently preoccupied with thoughts of food *after* a meal, a phenomenon which is rarely found in the non-obese."

Among the other participants in the seminar was Burton Cohen, MD, senior attending cardiologist at St. Elizabeth's Hospital in Elizabeth, NJ, and assistant professor of clinical medicine at New Jersey College of Medicine and Dentistry in Jersey City. Dr. Cohen is also associate director of the White Cardiopulmonary Institute, Pollak Chest Hospital, Jersey City.

Dr. Cohen discussed the treatment of obesity as a medical disease in office practice. He noted that of 300 consecutive patient physical examinations

over an eight-month period, nearly half (48.3%) were classified as obese (more than 15% above standard weight).

Among this obese group, 12.3% had high blood pressure; 10.3% showed an elevated blood cholesterol level; 9% had a history of gall bladder disease; 7.7% were diabetic; and 6.7% gave evidence of heart damage from arterial blockage.

Dr. Cohen indicated the use of prolonged release anoretic (appetite-suppressant) agents as part of a comprehensive supervised program of weight reduction "can produce very satisfactory results."

"Over an average of 6.5 months, 35 obese patients suffering from high blood pressure reduced their average body weight from 204.6 pounds to 171.8 pounds. Average blood pressures for this group dropped from 189.0/105.0 to 138.4/83.3.

"Similarly, in the management of 19 patients with diabetes mellitus, an average weight reduction for the group to 170.9 pounds from 180.8 pounds allowed the average insulin requirement to be nearly halved from an average of 37.0 units to 19.2 units."

Edgar Stillwell Gordon, MD, joined the discussion to describe the relationship between metabolism and obesity. Dr. Gordon, a graduate of the Harvard University School of Medicine and formerly a resident in pathology at Massachusetts General Hospital, Boston, is now professor of medicine and chief of the division of metabolism and endocrinology at University Hospital, Madison, Wisc.

"Obesity may be related to individual differences in the thermodynamic efficiency of the 'human engine' from person to person," Dr. Gordon said. "If the 'human engine' is even one or two percent inefficient, a person can become obese.

"There seems to be a progressive loss of ability to oxidize or 'burn' glucose sugars from the normal individual to the mildly obese to the diabetic obese, and a similar pattern seems to take place in the oxidation of free fatty acids."

Dr. Gordon stressed that there are "many oddities of metabolic behavior in the obese, and we're not sure if these differences between normal and obese patients are the result or the cause of the obesity."

"I still think," Dr. Gordon concluded, "that people are obese because they eat too much, but

what is too much for one man is not too much for another."

The fourth participant in the seminar was Alvan Richard Feinstein, MD, presently associate professor of medicine at Yale University. Dr. Feinstein received his medical degree from the University of Chicago in 1952 and since that time has served as a visiting investigator at the Rockefeller Institute Hospital and as assistant resident in medicine at Presbyterian Hospital, New York City. Dr. Feinstein was previously director of epidemiologic studies at Irvington House in New York City and chief of clinical biostatistics at the Veterans' Hospital in New Haven, Conn.

"The fact of obesity is of direct relevance in the presence and treatment of such conditions as diabetes, cardiovascular conditions and orthopedic ailments," Dr. Feinstein said. "In the past," he continued, "we have probably placed too little emphasis on the importance of the so-called 'Pickwickian syndrome' in which obesity causes a lessening of vital lung capacity and the characteristic 'fat boy' appearance and wheeze. This, in turn, seriously hampers oxygen exchange and can badly upset the body's whole system of cell metabolism."

New release from Strasenburgh Laboratories, Feb 7, 1967.

From Cartagena

The S.S. HOPE arrived in the port city of Cartagena, Colombia, on February 16, with 104 doctors, nurses and technologists aboard, to begin a 10-month medical teaching-treatment mission.

Heading the HOPE team is William B. Walsh, MD, of Washington, DC, president and founder of Project HOPE. Walter C. Rogers, MD, of Pasadena, Cal, who served with HOPE in Africa, and as chief of staff aboard the ship last year in Nicaragua, is aboard again this year in that capacity. William W. Peters, of Greensburg, Pa, is hospital administrator and Dorothy Aeschliman, of Sacramento, Cal, is chief nurse. Miss Aeschliman has served on each of HOPE's voyages with the exception of last year's mission to Nicaragua. Captain Elijah Howe, of Middletown, New York, a veteran of HOPE's voyages to Peru and Nicaragua, heads the Grace Line crew which operates the ship.

The "permanent" staff aboard the ship is aug-

mented by groups of 30 volunteer physicians and dentists who serve as volunteers on a rotating basis for periods of two months each. Together, the permanent staff and volunteers work side-by-side with their Colombia counterparts in wards, laboratories, classrooms, and in cities and towns surrounding Cartagena.

The mission to Colombia marks the third visit of the S.S. HOPE to South America. In 1962-63, the medical programs were conducted in Peru and in 1964, Ecuador. Other nations visited since its maiden voyage in 1960 include Indonesia, South Vietnam, Guinea and Nicaragua. HOPE shore-based centers remain in Vietnam, Peru, Ecuador and Nicaragua.

HOPE is in Colombia at the invitation of the Colombia Medical School Association and the University of Cartagena School of Medicine, in cooperation with the government of Colombia. HOPE will offer training programs in medicine, dentistry, nursing, medical technology and public health.

Founded in 1958 by Dr. Walsh, Project HOPE is the principal activity of The People-to-People Health Foundation, Inc., of Washington, DC, an independent, non-profit corporation sponsored by contributions from the American people. American industry alone has donated nearly $9 million in products.

From a Project HOPE news release, Feb 1967.

From New York

Fewer new medicines were introduced in the United States in 1966 than in any of the previous 18 years for which accurate records are available, according to a report released January 30 by Paul de Haen, Inc., Drug Information Services.

The number of prescription drug products introduced last year dropped to 80 from 112 the year before. Over a ten-year period the number of new medicines approved by the United States Food and Drug Administration for marketing has declined 80%, the report stated. New drug products consist of single chemical agents, duplicates of existing products, combinations of existing products and new dosage forms.

Sharpest decline was in the number of single new chemical agents. The figure reached a new low of 12 after a high of 63 in 1959.

The seven drug products are: a highly potent diuretic, an antituberculosis agent, two tranquilizers, an antidepressant, an antiarthritic and a drug for anemia.

The number of firms introducing new drug products has also declined sharply, the report indicates, from 127 firms in 1957 to 52 in 1966.

Commenting on the figures for 1966 Mr. de Haen said they show a continuation of trends that have important implications for the American public. He identified them as follows:

1. The decline in introductions of major new prescription drugs in the United States.
2. The increased time required by the Food and Drug Administration to act on approval of new drugs.
3. The increasing number of new drugs being marketed overseas before they are available to physicians in this country.
4. The decline in the number of American companies that are introducing new medicines. (Since the cost of pharmaceutical research is increasing—because of government regulations and because today's highly potent and effective drugs require more extensive studies prior to general release to the practicing physician—it is expected that drug research and development in the United States will eventually be conducted by fewer companies. However, the limited information from the Federal Drug Administration regarding the number of new drugs submitted each year for approval will make it difficult to assess the course of this latter trend.)

The Table shows the results of a de Haen New Product Survey covering the past ten years.

The number of single chemical agents introduced in the United States last year was lower than in any of the four major countries of western Europe. Thirty-four were marketed in France, 42 in Germany, 20 in Great Britain and 21 in Italy. One-third of all these drugs were developed by American scientists. During 1966 the American drug industry marketed in those countries seven new single chemical agents that were not available to physicians in the United States during the year. Two of the seven, however, were approved for marketing in this country in January 1967.

FOUR OF THE PROMINENT PHYSICIANS WHO WILL SPEAK AT APRIL MEETING

Dr. Carbone

CURRENT MANAGEMENT OF PATIENTS WITH MALIGNANT LYMPHOMA
The Annual I. Ridgeway Trimble Lecture
presented by
PAUL P. CARBONE, MD

Dr. Carbone is head of the Solid Tumor Service Medicine Branch at the National Cancer Institute in Bethesda.

After an internship and two years as medical resident, Dr. Carbone became senior investigator of the NCI Medicine Branch. Since 1962 he has been clinical instructor in medicine at Georgetown University Medical School and hematology lecturer at the Walter Reed Army Institute of Research. Dr. Carbone is a member of many medical societies, among them the American Federation of Clinical Research, the American Association for Cancer Research, the American Society of Hematology, the Transplantation Society, and the American Society of Clinical Oncology. In 1963 he was certified by the Board of Internal Medicine.

BRONCHOGENIC CARCINOMA
The Annual J. M. T. Finney Fund Lecture
presented by
JOHN Y. TEMPLETON, III, MD

Dr. Templeton

Dr. Templeton is director of the Division of Surgery at the Pennsylvania Hospital and professor of surgery at the University of Pennsylvania School of Medicine.

A graduate of Davidson College in and Jefferson Medical College in Philadelphia, Dr. Templeton served an internship and a residency in general and thoracic surgery at Jefferson Hospital. His many hospital appointments include those of consultant in thoracic surgery at the Philadelphia Naval Hospital, Valley Forge Army Hospital, and the Chestnut Hill Hospital; consultant in cardiovascular surgery at the Polyclinic Hospital in Harrisburg; and consultant in cardiac surgery at Haverford Hospital. Dr. Templeton is a member of numerous medical societies and committees, has many teaching appointments, and is the author of more than sixty scientific articles, which have been published in national and specialty journals.

Dr. Templeton is certified by the American Board of Surgery and by the American Board of Thoracic Surgery.

Dr. Gordon

THE METABOLIC RELATIONSHIPS BETWEEN OBESITY, DIABETES, AND CORONARY ARTERY DISEASE
The Annual Jesse C. Coggins Fund Lecture on Geriatrics
presented by
EDGAR S. GORDON, MD

Dr. Gordon is professor of medicine and chief of the Metabolism and Endocrinology Clinic at the University of Wisconsin.

After graduation from the University of Wisconsin, Dr. Gordon received his MD degree from Harvard Medical School. He is presently consultant to the National Aeronautics and Space Agency, Oak Ridge Institute of Nuclear Studies, and to the Institute of Arthritis and Metabolic Disease of the National Institutes of Health. Dr. Gordon is a Diplomate of the American Board of Internal Medicine, and a member of numerous other professional societies. His special fields of interest are: isotopes, nutrition, endocrinology, adrenal physiology, neuroendocrine system, and metabolism. Dr. Gordon is well-known for his clinical research in obesity.

His lecture will be open to the general public as well as to members of the medical profession.

THE MENOPAUSE
J. Mason Hundley Annual Lecture in Gynecology
presented by
JOHN W. WALSH, MD

Dr. Walsh

Dr. Walsh is clinical professor of obstetrics and gynecology at the Georgetown University School of Medicine.

A graduate of Notre Dame University, he received his MD degree from the Long Island College of Medicine. He served an internship at the Long Island College Hospital and a residency at the New York Lying-In Hospital. During his military service, Dr. Walsh received a Unit Citation and four Battle Stars. He is a member of several medical societies and is a founding fellow of the American College of Obstetrics and Gynecology. He has had numerous articles published on the subjects of x-ray pelvimetry, sarcoma of the uterus, and endometrial carcinoma.

In February of this year, Dr. Walsh began his first voyage with the hospital ship S.S. HOPE, during which he will head a rotating staff of three obstetricians and gynecologists in Cartagena, Colombia, for a period of five weeks. He will return to this country just prior to presenting the Hundley Lecture. Dr. Walsh is a brother of William B. Walsh, MD, founder and president of Project HOPE.

5 basic uro-analytical facts in 30 seconds

Labstix®

BRAND REAGENT STRIPS

...broadest urine screening possible from a single reagent strip

Urine test results with LABSTIX Reagent Strips can represent significant guides to differential diagnosis or therapy in many conditions. An unexpected "positive" may enable you to detect hidden pathology—long before more recognizable symptoms become evident. Negative results, which permit you to rule out abnormalities in a broad clinical range, can serve as baseline values for reference in future examinations. The 5 colorimetric test areas encompassed on LABSTIX Reagent Strips are:

pH—values are read numerically in the essential range of pH 5 to pH 9.

Protein—results are read either in the "plus" system or in mg. % in amounts approximating "trace," 30, 100, 300, and over 1000 mg. %.

Glucose—provides a "Yes-or-No" answer for urine "sugar spill."

Ketones—detects ketone bodies in urine—**both** acetoacetic acid and acetone. Reacts with as little as 5 to 10 mg. % of acetoacetic acid.

Occult Blood—specific test for intact red cells, hemoglobin or myoglobin. Results are read as negative, small, moderate or large amounts.

Now a Clear Reagent Strip of Firm Construction

...facilitates handling during testing procedure. Excellent color contrast made possible by the clear plastic strip, together with the clearly defined color charts provided, permits precise, reproducible colorimetric readings in all 5 test areas. A more definitive interpretation of uro-analytical facts is made possible.

Available: LABSTIX Reagent Strips, bottles of 100 (color charts are supplied with each bottle).

Doctor's Day—March 30, 1967

Doctor's Day is a special day observed each year to honor the members of the medical profession, both living and dead, who have devoted their lives to the art of healing.

The idea of Doctor's Day originated in Georgia in 1933 and was adopted by the Woman's Auxiliary to the American Medical Association in 1934. Since the analogy of the carnation is closely intertwined with medical science, the red carnation was chosen in 1949 as the symbol of Doctor's Day.

March 30, the official date, commemorates one of the greatest discoveries for the alleviation of pain and suffering. On March 30, 1842, Dr. Crawford W. Long first used ether anesthesia in surgery.

In recognition of the doctors' contributions to the people and communities they serve, the Enoch Pratt Free Library will dedicate a window of the Central Library to Doctors' Day. The window display will be on view from March 28 to April 24.

Also in honor of Doctor's Day, a contribution will be made by our auxiliary to the American Medical Association Education and Research Foundation, to be divided equally between The Johns Hopkins and The University of Maryland schools of medicine.

Mrs. Percy H. Sutley, *President*
Woman's Auxiliary to the Baltimore City Medical Society

Mrs. William J. R. Dunseath, *Chairman*
Doctor's Day

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

EXECUTIVE COMMITTEE, FEBRUARY 2

1. On recommendation of the Public Relations Committee, quarterly meetings of the executive secretaries of component societies, which have been held on a one-year trial basis, were approved on a permanent basis, with the Faculty underwriting the expenses.

2. The Committee approved in principle the suggestion of the University of Maryland Chapter of the Student AMA that representatives of their group attend various Faculty Committee meetings in order to become aware of Faculty activities and to communicate information about them to fellow members. It is to be understood that the Chapter will advise the Faculty in writing as to which Committee meetings they are interested in attending and that, in each case, the Committee chairman will be the final arbiter of attendance.

3. It was reported that a letter from the Judicial Council of the AMA, on the subject of compulsory assessment of staff members at St. Joseph Hospital and Maryland General Hospital, stated, ". . . that compulsory assessments, that is, assessments which, if not paid, would result in the loss of staff privileges, are not considered proper." The Committee agreed that, inasmuch as the complaints involved do not fall within the definition, there has been no violation of ethical principles in this area.

4. A letter from John C. Harvey, MD, written in response to an inquiry from the Committee, was read. The letter stated that staff appointments at the new Good Samaritan Hospital would be made according to the guidelines of the Joint Committee on Accreditation of Hospitals.

5. The Committee voted for the expenditure of up to $15,000 from the Educational Fund for educational and publicity materials necessary in the promotion of the statewide measles immunization program endorsed by the Council on January 19. Plans for the use of these funds, which is limited to the purposes stated, are to be submitted for Committee approval by the steering committee that will be appointed from among Faculty members and State Health Department personnel. Any overage at the conclusion of the campaign, which is essentially a component society project, will be retained by the Faculty in a special account for future immunization programs of like nature.

6. Representatives of the State Health Department, the State Board of Health and Mental Hygiene, the State Budget Bureau, the Faculty Fee Schedule Committee and the Faculty PL 89-97 Subcommittee joined the Executive Committee for an extensive discussion of problems related to the presentation to the State Legislature of the 1968 Fiscal Budget for the State Health Department, particularly as it is affected by the Title 19 program. Mr. Henry Bosz, of the Budget Bureau, reported that the figures for "physicians' services" presented to the Bureau by the Health Department had been in line with the recommendations of the Council on Medical Care, the State Board of Health and Mental Hygiene and the Faculty, but, of necessity, had been cut by the Bureau.

7. The Faculty has made available its services for arbitration of the dispute between four physician-members and Suburban General Hospital with regard to the renewal of a contract covering "Emergency Room Services" on a 24-hour, 365-day basis.

Tandearil®
oxyphenbutazone

Therapeutic Effects: Tandearil is a nonhormonal compound which may rapidly resolve inflammation and help restore normal joint function. Its action does not affect pituitary-adrenal function or impair immune responses. Its value in osteoarthritis is especially noteworthy because this disorder responds inconsistently to steroids and is often resistant to salicylates. Further, indomethacin is limited only to osteoarthritis of the hip, whereas oxyphenbutazone is effective in all forms of the disease.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.

Precautions: Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should be closely supervised and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage. Make regular blood counts. Discontinue the drug and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The most common are nausea, edema and drug rash. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, or a generalized allergic reaction may occur and require withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Osteoarthritis: The initial daily dosage in adults is 300-600 mg. in divided daily doses. When improvement occurs, dosage should be decreased to the minimum effective level; this should not exceed 400 mg. daily, and is often achieved with only 100-200 mg. daily.

For complete details, please refer to full prescribing information. 6562-VI(B)R

Availability: Tablets of 100 mg.

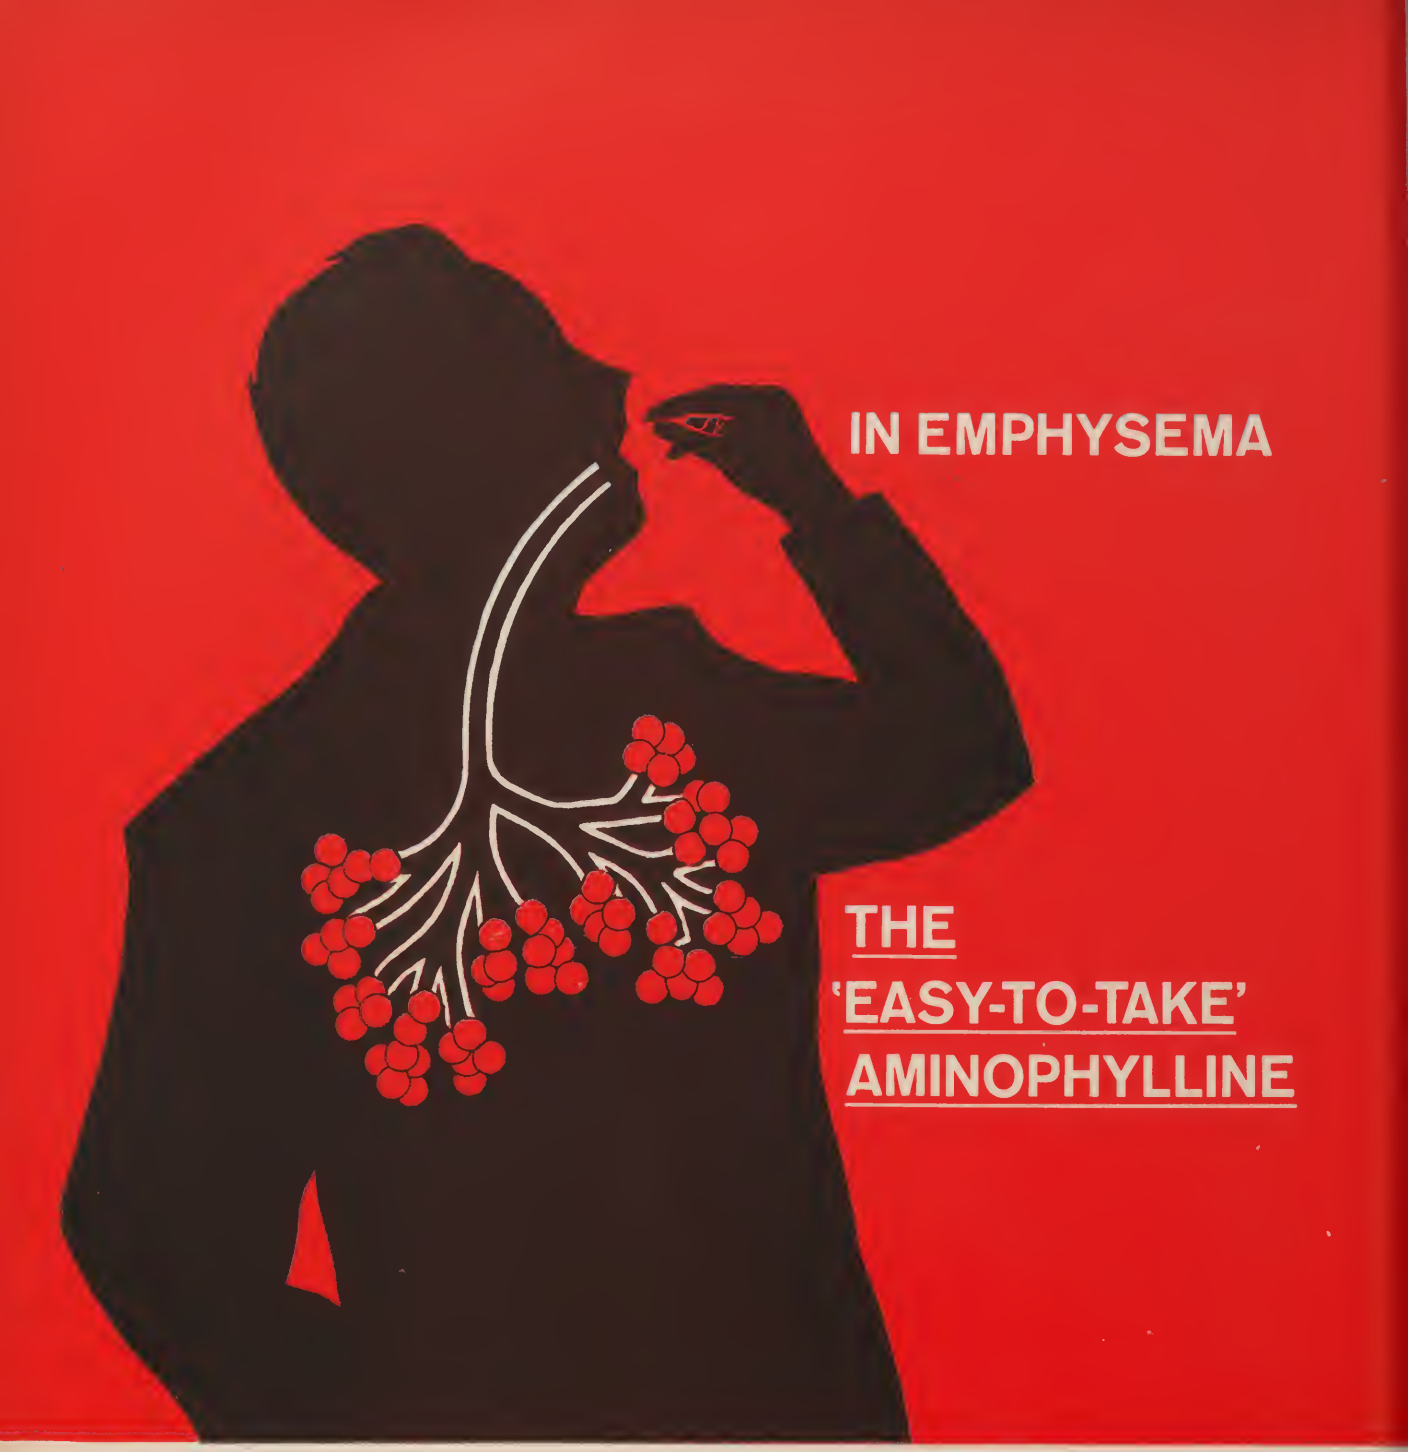
Tandearil®
oxyphenbutazone

helps osteoarthritic joints move again



3 out of 4 osteoarthritics completely or markedly improved

Sperling, I.L.: 3 Years' Experience with Oxyphenbutazone in the Treatment of Rheumatic Disorders, Applied Therapeutics 6:117, 1964.	76.9% of 407 patients
Watts, T.W., Jr.: Treatment of Rheumatoid Disorders with Oxyphenbutazone, Clin. Med. 73:65, 1966.	84.6% of 39 patients

Please see adjoining page for brief prescribing summary

TA-4919 PC

Aminophylline dura-tabs®

prolonged-medication tablets 4½ gr. (0.3 Gm.)

Precautions: Use with caution in patients with poor renal function as a decreased rate of excretion may lead to accumulation and untoward reactions. Gastric irritation may occasionally be observed in certain patients sensitive to oral aminophylline.

Dosage: Adults, 1 to 2 Aminophylline Dura-Tabs each 8 or 12 hours, with food.

RARELY UPSET THE STOMACH

Oral aminophylline needn't disturb the stomach—nor a good night's sleep. Patients breathe easier all day, sleep better all night, as each Aminophylline Dura-Tab dose provides effective therapeutic activity for up to 12 hours. And unlike conventional tablets, AMINOPHYLLINE DURA-TABS seldom cause gastric distress. The special Dura-Tab process allows the gradual absorption of the medication from the intestinal tract with only a small fraction of the dose released in the stomach.

ETHICAL GUIDELINES FROM THE AMA JUDICIAL COUNCIL

Clinical Investigation

At the 1966 Annual Convention of its House of Delegates, the American Medical Association endorsed the ethical principles set forth in the 1964 *Declaration of Helsinki* of the World Medical Association concerning human experimentation. These principles conform to and express fundamental concepts already embodied in the *Principles of Medical Ethics* of the American Medical Association.

The following guidelines, enlarging on these fundamental concepts, are intended to aid physicians in fulfilling their ethical responsibilities when they engage in the clinical investigation of new drugs and procedures:

1. A physician may participate in clinical investigation only to the extent that his activities are a part of a systematic program competently designed, under accepted standards of scientific research, to produce data which is scientifically valid and significant.
2. In conducting clinical investigation, the investigator should demonstrate the same concern and caution for the welfare, safety and comfort of the person involved as is required of a physician who is furnishing medical care to a patient independent of any clinical investigation.
3. In clinical investigation *primarily for treatment*—
   a. The physician must recognize that the physician-patient relationship exists and that he is expected to exercise his professional judgment and skill in the best interest of the patient.
   b. Voluntary consent must be obtained from the patient, or from his legally authorized representative if the patient lacks the capacity to consent, following: (a) disclosure that the physician intends to use an investigational drug or experimental procedure, (b) a reasonable explanation of the nature of the drug or procedure to be used, risks to be expected, and possible therapeutic benefits, (c) an offer to answer any inquiries concerning the drug or procedure, and (d) a disclosure of alternative drugs or procedures that may be available.
      i. In exceptional circumstances and to the extent that disclosure of information concerning the nature of the drug or experimental procedure or risks would be expected to materially affect the health of the patient and would be detrimental to his best interests, such information may be withheld from the patient. In such circumstances such information shall be disclosed to a responsible relative or friend of the patient where possible.
      ii. Ordinarily, consent should be in writing, except where the physician deems it necessary to rely upon consent in other than written form because of the physical or emotional state of the patient.
      iii. Where emergency treatment is necessary and the patient is incapable of giving consent and no one is available who has authority to act on his behalf, consent is assumed.
4. In clinical investigation *primarily for the accumulation of scientific knowledge*—
   a. Adequate safeguards must be provided for the welfare, safety and comfort of the subject.
   b. Consent, in writing, should be obtained from the subject, or from his legally authorized representative if the subject lacks the capacity to consent, following: (a) a disclosure of the fact that an investigational drug or procedure is to be used, (b) a reasonable explanation of the nature of the procedure to be used and risks to be expected, and (c) an offer to answer any

inquiries concerning the drug or procedure.

c. Minors or mentally incompetent persons may be used as subjects only if:
   i. The nature of the investigation is such that mentally competent adults would not be suitable subjects.
   ii. Consent, in writing, is given by a legally authorized representative of the subject under circumstances in which an informed and prudent adult would reasonably be expected to volunteer himself or his child as a subject.

d. No person may be used as a subject against his will.

Laboratory Services

The following questions and answers are provided by the Judicial Council in response to inquiries raised by a number of medical societies.

Q: A laboratory is owned by a physician who spends a small portion of his time directing and managing its financial and business affairs. The laboratory work is performed by technicians and directly supervised by a medical technologist with little or no participation by the physician-owner. The physician's name is used in connection with the laboratory in a manner to create the appearance that it is owned, operated and supervised by a doctor of medicine. Is the physician engaged in an unethical activity? Would it make any difference if he were not the owner, but merely received compensation for his time? Or if he were a partner with the supervising technologist or participated without receiving any compensation or share of the profits?

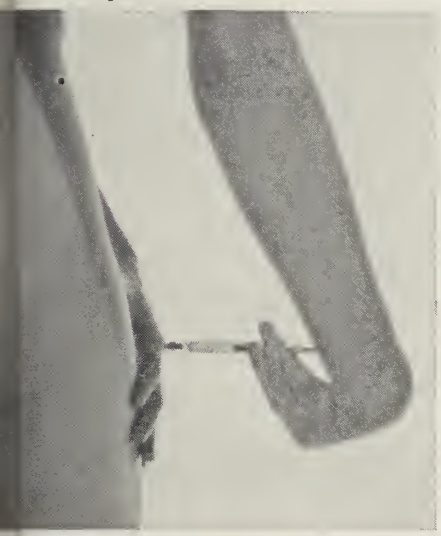
A: In each of the situations set forth above the physician would be guilty of deception and unethical conduct in misrepresenting or aiding the misrepresentation of laboratory services performed and supervised by a non-physician, as physician's services.

Q: A laboratory, owned, operated and supervised by a non-physician in accordance with state law, performs tests exclusively for physicians who receive the results and make their own medical interpretations. Is it permissible for physicians to utilize the services of these laboratories?

A: The physician's ethical responsibility is to provide his patients with high quality services. This includes services which he performs personally and those which he delegates to others. A physician should not utilize the services of any laboratory, irrespective of whether it is operated by a physician or non-physician, unless he has the utmost confidence in the quality of its services. He must always assume personal responsibility for the best interests of his patients. Medical judgment based upon inferior laboratory work is likewise inferior. Medical considerations, not cost, must be paramount when the physician chooses a laboratory. The physician who disregards quality as the primary criterion or who chooses a laboratory because it provides him with low cost laboratory services on which he charges the patient a profit, is derelict in not acting in the best interests of his patient. However, if reliable quality laboratory services are available at lower cost, the *patient* should have the benefit of the savings. As a professional man, the physician is entitled to fair compensation for his services. He is not engaged in a commercial enterprise and he should not make a markup, commission, or profit on the services rendered by others.

Use of Terms "Ethical" and "Unethical"

The Judicial Council has been asked to comment upon the use of the terms "ethical" and "unethical" as used in *Opinions and Reports* of the Judicial Council and resolutions of the House of Delegates of the American Medical Association.



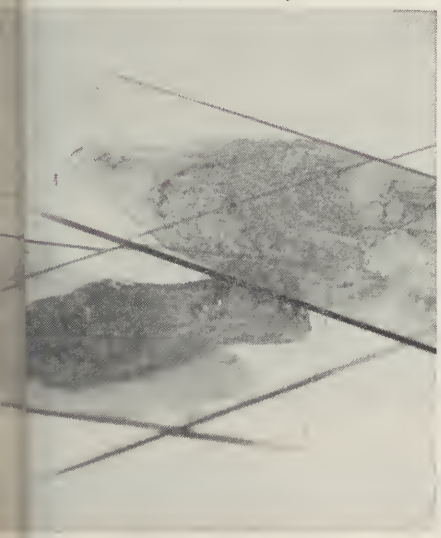
Historically, the term "ethical" has been used in these respects to refer to matters involving (1) moral principles or practices; (2) customs and usages of the medical profession; and (3) matters of policy not necessarily involving issues of morality in the practice of medicine. The term "unethical" has been used to refer to conduct which fails to conform with these professional standards, customs and usages, or policies, as

New
low-cost tetracycline/antifungal therapy

for broad-spectrum activity
plus specific antifungal prophylaxis
at significant patient savings

Whenever tetracycline is indicated in these candidates for Candida:

1. diabetic patients



2. nonpregnant women with a history of recent or recurrent monilial vaginitis

3. elderly or debilitated patients

4. patients with a past history of moniliasis

5. patients on long-term tetracycline or corticosteroid therapy

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indicotions:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Controindications:* The drug is contraindicated in patients hypersensitive to its components. *Wornings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood.) *Precoutions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reoctions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosoge:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

when he just can't sleep

Tuinal®

Sodium Amobarbital and Sodium Secobarbital

(One-Half Sodium Amobarbital and One-Half Sodium Secobarbital)

Tuinal helps wakeful patients fall asleep fast, stay asleep all night.

Indications: Tuinal, comprised of equal parts of Seconal® Sodium (sodium secobarbital, Lilly) and Amytal® Sodium (sodium amobarbital, Lilly), is indicated for prompt and moderately long-acting hypnosis.

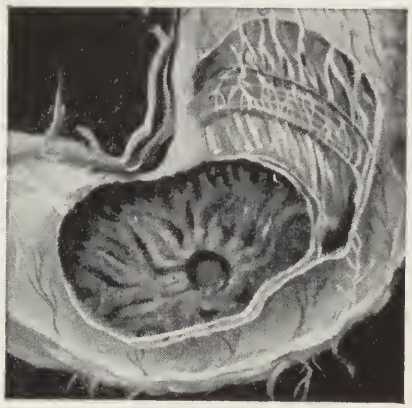
Contraindications: Barbiturates should not be administered to anyone with a history of porphyria, nor should they be given in the presence of uncontrolled pain, because excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Dosage: 1½ to 3 grains at bedtime.



Supplied: ¾, 1½, and 3-grain Pulvules®.

Additional information available to physicians upon request.

Lilly

700196

In peptic ulcer... antacid therapy with a new benefit

CONTAINS A BALANCED COMBINATION OF THE MOST WIDELY USED ANTACIDS— FOR RAPID NEUTRALIZATION. PLUS SIMETHICONE— TO CONTROL THE FACTOR WHICH ANTACIDS ALONE CANNOT INFLUENCE.

Mylanta®

- In Mylanta, aluminum and magnesium hydroxides are balanced to minimize the chance of constipation or laxation and still achieve rapid acid neutralization and pain relief.
- The positive action of simethicone helps relieve the painful gas symptoms which often accompany the peptic ulcer syndrome.
- The nonfatiguing flavor and smooth, nongritty consistency of tablets and liquid encourage continued patient cooperation during long-term therapy.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) of liquid contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. **Dosage:** one or two tablets, well chewed or allowed to dissolve in the mouth, or one or two teaspoonfuls of liquid to be taken between meals and at bedtime.

The Stuart Company, Pasadena, California
Division of Atlas Chemical Industries, Inc.

Stuart

interpreted by the American Medical Association.

Unethical conduct involving *moral principles,* values and duties calls for disciplinary action such as censure, suspension, or expulsion from medical society membership.

Failure to conform to the *customs and usages* of the medical profession may call for disciplinary action depending upon the particular circumstances involved, local attitudes, and how the conduct in question may reflect upon the dignity of and respect for the medical profession.

In matters strictly of a policy nature, a physician who disagrees with the position of the American Medical Association is entitled to freedom and protection in his point of view.

Charging Penalties for Overdue Accounts

"Since the practice of medicine is a profession and not a business, the practices adopted by businesses are not necessarily suitable for professional practice.

"It is not in the best interest of the public or the profession to charge interest on an unpaid bill or note or to charge a penalty on fees for professional services not paid within a prescribed period of time nor is it proper to charge a patient a flat collection fee if it becomes necessary to refer the account to an agency for collection."

Associations Between Doctors of Medicine and Optometrists

Q: May optometrists be employed as ancillary personnel to assist ophthalmologists?

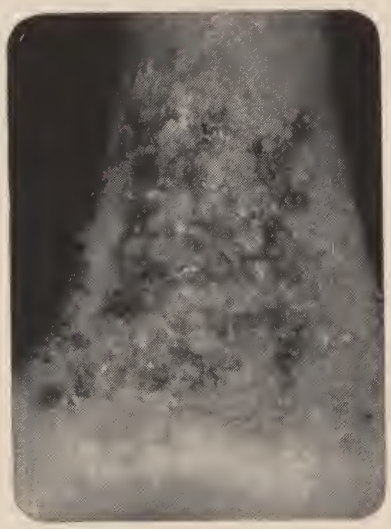
A: It is not unethical for an ophthalmologist to employ an optometrist as ancillary personnel to assist him provided the optometrist is identified to patients as an optometrist and not as a doctor of medicine. The ophthalmologist has an ethical responsibility to take affirmative measures to make sure that patients will not be given the impression that the optometrist is also a doctor of medicine.

Q: May a physician teach in a school of optometry?

A: Since optometry is not a cult, physicians may, in accord with the provisions of Resolution 107 adopted in June, 1966, by the House of Delegates, teach in recognized schools of optometry for the purpose of improving the quality of optometric education. The scope of this teaching may embrace subjects within the legitimate scope of optometry which are designed to prepare students to engage in optometry within the limits prescribed by law.

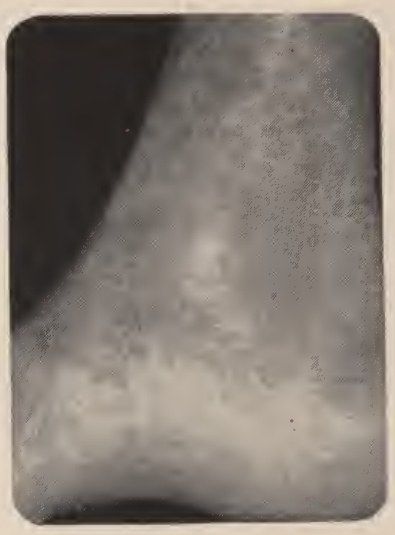
Relations with the Communication Media

Many people, literate and well educated, do not possess a special knowledge of medicine. Medical books and journals are not always easily accessible or readily understandable.



Physicians are aware that patients' information concerning health and health education frequently comes from the daily or weekly newspaper. The press, together with popular magazines, radio, and television, are often the primary, and for many, the only source of information about medicine and health.

The public is eager to learn all it can of the most recent advances in the cure of diseases. It is anxious to learn about and put into effect the best methods of public hygiene and preventive medicine. The daily press and other communication media have correctly considered such subjects as news. It is in the public interest that this news be accurate and presented by spokesmen trained in medicine.



The American Medical Association is well aware that specific decisions regarding relations between physicians and the communication media must and should be determined at the community level by the local medical society and its membership. These guidelines are offered to the county medical society as a starting point and a reference to help them develop and improve press relations at the community level.

The following guidelines have been approved by the Judicial Council of the American Medical Association to aid in the smoother flow of accu-

Eczema of many years... controlled in two weeks

Before treatment

After treatment —
with ARISTOCORT Topical Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.

Available in 5 Gm. and 15 Gm. tubes and ½ lb. jars.

406-6

rate medical news from the medical profession to those who collect and disseminate such news:

1. Each medical society should appoint a communications committee, or designate a responsible individual or individuals, whose duty shall be to provide the communication media with accurate information on all medical matters of interest to the public. This information should be given freely. The communications committee may also serve in an advisory capacity to all communication media and to all physicians of its society in questions involving relationship with the media. To assist the media in obtaining information, medical societies may furnish the media with a list of names of physicians from whom authoritative information may be obtained, or a designated individual may serve as liaison between the media and the profession and furnish names of physicians to provide authoritative information when required.

   These spokesmen may be quoted by name and title. This should not be considered by their colleagues as seeking publicity, since it is done in the best interest of the public and the profession. They may ethically provide appropriate information regarding medical and public health matters which have been discussed in technical papers or during medical meetings.

   The officers, committee chairmen, and designated spokesmen of medical societies should be available at all times to bonafide representatives of the communication media in order that authentic information may be obtained as soon as possible.

2. Because certain news (1) is a part of the public record, or (2) is a matter of concern to civil authorities, it is readily available for publication. Physicians should cooperate with the press to insure that medical news of this sort is available more promptly and more accurately than would be possible without their assistance.

   News in this category, known as news in the public domain, includes: births, deaths, accidents, and police cases.

   The following information in the public domain can be made available without the patient's consent:

   a. Personal information: patient's name, address, age, sex, race, marital status, employer, occupation, name of parents in case of births, name of next-of-kin in case of deaths.

   b. Nature of accident:
      Only general information regarding injuries will be released. This consists of the name of the injured portion of the body such as back injury, etc.
      It may be stated that there are internal injuries.
      If the patient is unconscious when brought to the hospital, a statement to that effect may be made.
      Statements regarding the circumstances surrounding shootings, knifings and poisonings are properly police matters and questions as to whether they were accidental or otherwise should be referred to the appropriate authorities.
      A statement may be made to the effect that the patient was injured by a knife or other sharp instrument, but no statement may be made as to whether or not it was assault, accident, or self-inflicted.
      A statement may be made that the patient received burns and the member of the body affected may be indicated.
      No statement may be made that there was a suicide or attempted suicide.
      No statement may be made to the effect that intoxication or drug addiction was involved.
      No statement may be made that moral turpitude was involved.

   c. Diagnosis and prognosis:
      Inasmuch as a diagnosis may be made only by a physician and may depend upon X-ray and laboratory studies, no statement regarding diagnosis should be made except by or on behalf of the attending physician
      For the same reason prognosis will be given only by the attending physician or at his direction.

   d. Patient's condition:
      A statement may be made as to the general condition of the patient using the following classifications: minor injuries or

TABLETS

Equagesic®

(meprobamate and ethoheptazine citrate with aspirin)

Wyeth®

Precautions: Keep out of reach of children. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use of meprobamate may result in dependence or habituation in susceptible persons—as ex-addicts, alcoholics, severe psychoneurotics. Withdraw gradually after prolonged high dosage to avoid possibly severe withdrawal reactions including epileptiform seizures. Warn patients of possible reduced alcohol tolerance. If drowsiness, ataxia or visual disturbances occur, reduce dose. If symptoms persist, caution patients against operating machinery or driving. Give cautiously to patients with suicidal tendencies. Treat attempted suicide with immediate gastric lavage and appropriate supportive therapy

Side Effects: Ethoheptazine and aspirin may occasionally cause nausea, vomiting, epigastric distress, and rarely dizziness and CNS depression. Overdosage may result in salicylate intoxication. Meprobamate rarely causes allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever have been reported. Meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioedema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. A few cases of leukopenia, usually transient, have been reported following prolonged dosage. Rarely, cases of aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis, and hemolytic anemia have been reported; almost always, in the presence of known toxic agents.

Contraindications: History of sensitivity or severe intolerance to aspirin or meprobamate.

Composition: 150 mg. meprobamate, 75 mg. ethoheptazine citrate and 250 mg. aspirin per tablet.

Wyeth Laboratories Philadelphia, Pa.

Weighing on his mind, too

When pain evokes anxiety and tension, thereby heightening patient discomfort, a simple analgesic may only touch on part of the problem.

This single-prescription, nonnarcotic product, however, usually provides effective analgesia *and* helps put the patient's mind at ease.

similar general diagnosis, good, fair, serious, critical.

3. When information concerning a specific patient is requested, the physician must obtain the consent of the patient or his authorized representative before releasing such knowledge. The patient's decision is final under the law. A physician may, within the limits of good taste, encourage the patient or his family to state the cause of illness, or the cause of death, when this information is requested by a bona-fide representative of the press. Where a person of public interest is involved, and the release of information has been authorized, the physician may arrange for regular bulletins concerning the person. The ethical physician will use restraint and good judgment regarding the use of his name in connection with such published reports.

4. Publications of photographs of physicians, who appear before recognized medical organizations, either in the official program of the scientific meeting or before the public press in connection with such meeting, is permissible. The use of photographs in the press when physicians are elected to office or when physicians are quoted by name on matters of general interest, not related to the care of a specific patient, is likewise permissible. Photographs of physicians in connection with civic or social affairs, not related to medical news or the care of patients, may be published unless the frequency of such photographs bespeaks self-exploitation. This applies also to magazine articles. Physicians should clear such publicity, whenever possible, with their county society.

5. The promise of radical cures or boasting of extraordinary skill or success is considered unethical by the medical profession because it is contrary to the best interest of the public.

6. For purposes of clarity, the following principles should guide physicians who appear on TV or radio programs or who are interviewed in other media of public information, such as newspapers and magazines:

   a. Doctors of medicine are expected to refrain from sponsoring products directly or by implication.

   b. When introduced as a doctor on TV or radio programs, or quoted in an article as a physician in newspapers and magazines, such individual cannot escape the implication of representing the medical profession and his conduct should be in keeping with the high standards of the profession.

   c. Sound judgment, good common sense and adherence to the *Principles of Medical Ethics* are expected of any physician when appearing on TV or radio programs, or in other media of public information, such as newspapers and magazines, in whatsoever capacity.

7. Members of medical society speakers bureaus, because of the very nature of their assignments, may be interviewed or quoted by the communication media. This is not considered unethical conduct.

   The members of these committees must be most circumspect and uphold the ideals of the medical profession.

8. At all times the doctor of medicine is expected to comply with the *Principles of Medical Ethics*. Section 10 of the *Principles of Medical Ethics* deals with relationships between physicians and the communications media. It says: "The honored ideals of the medical profession imply that the responsibilities of the physician extend not only to the individual, but also to society where these responsibilities deserve his interest and participation in activities which have the purpose of improving both the health and the well-being of the individual and the community." The Judicial Council construes Section 10 as encouraging physicians to work with the communications media as an integral and important part of the principle of upholding the responsibility of the physician to society as a whole.

   It shall be the responsibility of each county society to see that these *Principles* are not violated.

9. Doctors of medicine are ethically and legally required to protect the personal privacy and other legal rights of patients. The doctor-patient relationship and its confidential nature must be maintained. With these considerations in mind, the physician may assist the representatives of these media in every way possible.

Participation by Physicians in Bank Card Programs

The growth and development of credit cards is burgeoning. A new form of card, the so-called *bank card,* is being widely introduced. Bank cards are issued without cost to the cardholder; they are acceptable at many more places than conventional credit cards; they are sponsored by large, reputable banks. They are an innovation in our economic system.

As these bank card plans have come into being, in all parts of the country, physicians have asked if they may ethically participate in the bank card program and accept such a card as a form of payment for professional services. Some medical societies have said physicians may participate; others have said physicians may not.

The Judicial Council believes a uniformity of opinion is desirable. In matters of ethics it would seem indisputable that a general rule should be determined for the guidance of the profession, and that this rule should be implemented at local level.

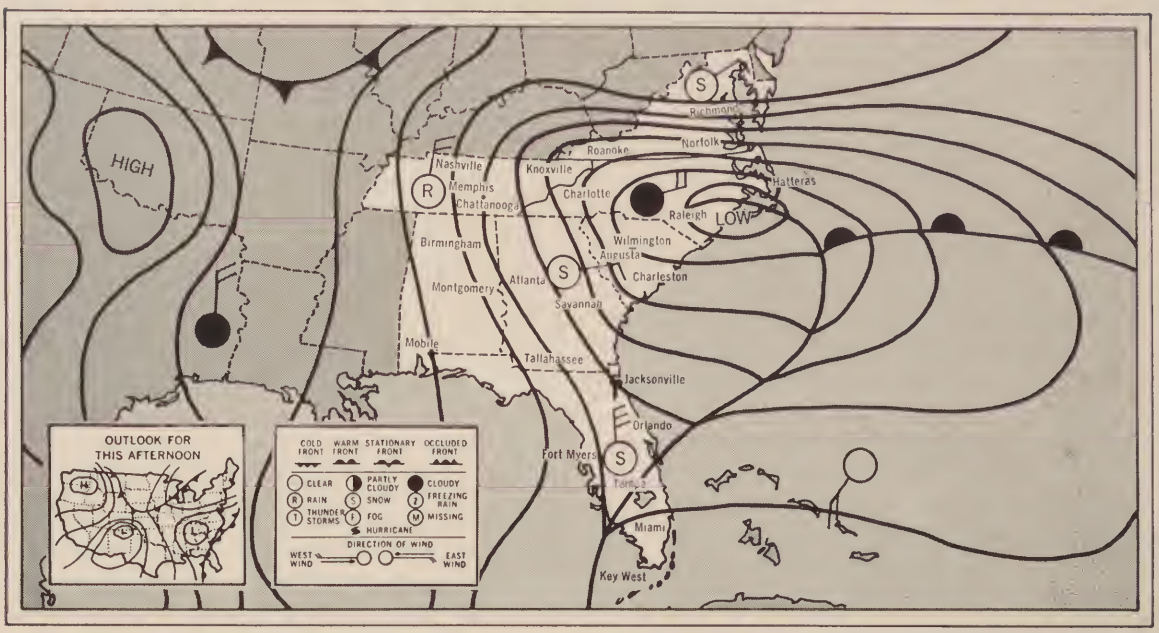
The medical profession has officially recognized that it cannot dictate to patients how they shall finance their medical bills. It can and should, however, determine principles to guide its members in determining whether and how they may participate in any payment program.

If the bank card were merely a substitute for cash or check in the payment of bills, little or no problem would be presented to physicians regarding their use; they would be merely a newly adopted medium of exchange. Bank cards, however, serve a twofold function: They are a convenience—a substitute for currency or check in the payment of indebtedness; and they are also a financing mechanism. Consequently, their indiscriminate use, especially the financing of larger medical bills through banks, could result in additional cost to patients. While the doctor's fee for medical care would not increase, the cost of financing payment of that fee through a third party would be imposed on the patient. Of course, patients may voluntarily elect to pay larger amounts in return for the convenience of a given program. Still, the medical profession has a responsibility to guard against patients being placed in untenable financial conditions because of overall medical care costs. That is why medicine has been in the forefront in encouraging prepayment and insurance programs to provide for the costs of medical services. It must, therefore, maintain its position of safeguarding patients' interests when considering new methods of financing personal indebtedness.

The Judicial Council is of the opinion that neither endorsement nor disapproval should be given to the bank card system at this time.

In June, 1965, the Judicial Council and the Council on Medical Service jointly agreed that any proposed plan for financing medical care or parts of medical care should be judged by the physician in the light of whether or not it might "result in advertising or solicitation of patients by physicians, profit to physicians for other than professional services, exploitation of the patient, or unnecessary increase in the cost of medical care."

Judged by these criteria, the Judicial Council is of the opinion, at this time, that physician participation in bank card programs is not per se unethical. It is of the opinion that physicians may ethically accept bank cards in the payment of current medical bills in lieu of cash or check, that is, as a medium of exchange.



The use of bank cards in financing medical fees must, however, be viewed with reserve at the present stage of their development. While patients may not be denied the right to determine matters of their personal budgeting, physicians must not encourage the use of this financing method if in operation it might compromise the ideals of the medical profession or add to the financial burden of patients.

In connection with physician participation in bank card programs, the Judicial Council recommends the following principles to be implemented and applied as necessary by the county medical society for the guidance of physicians as these programs develop:

1. The county medical society should be satisfied as to the financial and professional integrity of the plan. It should negotiate with the plan sponsors to insure that service charges to the physician are reasonable. It should insist that the plan be open to all physicians on the same terms and that it not exploit or capitalize on physicians' participation in the plan. It should advise the plan that the listing of physicians

REGIONAL WEATHER FORECAST

Record Low Temperatures and Heavy Rain Followed by Cough, Stuffed and Runny Noses and Aches and Pains.

Tussagesic breaks up coughs, quickly clears stuffed and runny noses and relieves aches and pains. Provide coverage of the tough cold for up to 24 hours with just a single timed-release tablet dosed morning, midafternoon and at bedtime.

each

Tussagesic®

timed-release tablet contains:

Triaminic® (phenylpropanolamine hydrochloride 25 mg., pheniramine maleate 12.5 mg., pyrilamine maleate 12.5 mg.)	50 mg.
Dextromethorphan hydrobromide	30 mg.
Terpin hydrate	180 mg.
Acetaminophen	325 mg.

Dosage: Adults—1 tablet, swallowed whole to preserve timed-release feature, in morning, midafternoon and at bedtime. *Side effects:* Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. *Precautions:* The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

WILLIAM E. JOHNSON

in directories of participating members is contrary to the ethics of the medical profession.

2. The individual physician may not, because of his participation, increase his fee for medical service rendered the patient. He may not use the plan to solicit patients. He may not encourage patients to use the plan. His position must be that he accepts the plan as a convenience to patients who desire to use it. Plaques or other devices indicating participation in the plan within the physician's office shall be kept to a discreet and dignified minimum. Plaques, signs, or other devices indicating such participation visible outside the physician's office are unacceptable.
3. The use of a bank card in connection with the payment of larger fees—which might normally be paid to the physician in installments—is not to be encouraged. All members of the Association are expected to continue the traditional practice of permitting patients of limited means to pay relatively large fees in installments without interest or carrying charges. Out of respect for the dignity and traditions of the medical profession, the physician may not relieve himself of his obligations "to render service to humanity, reward or financial gain being a subordinate consideration."

How long will it take him to recover from the flu if he just doesn't care?

Does he really care? Is he alert, encouraged, positive and optimistic about getting out of bed and back to work soon?

Or is he giving in to the depressing impact of confinement?

When functional fatigue complicates convalescence, Alertonic can help...

Pleasant-tasting Alertonic is pipradrol hydrochloride—an effective cerebral stimulant whose gentle analeptic action helps counteract the apathy and inertia that so often delay convalescence—together with an excellent vitamin and mineral formula, in a satisfying 15% alcohol vehicle.

Nothing fosters confidence and a sense of well-being better than your own personal warmth, understanding and encouragement together with Alertonic to help insure prompt response.

Adequate dosage is important: Prescribe Alertonic—one tablespoonful t.i.d., 30 minutes before meals...tastes best chilled.

And for your patient's sake, prescribe Alertonic in the convenient, economical one-pint bottle.

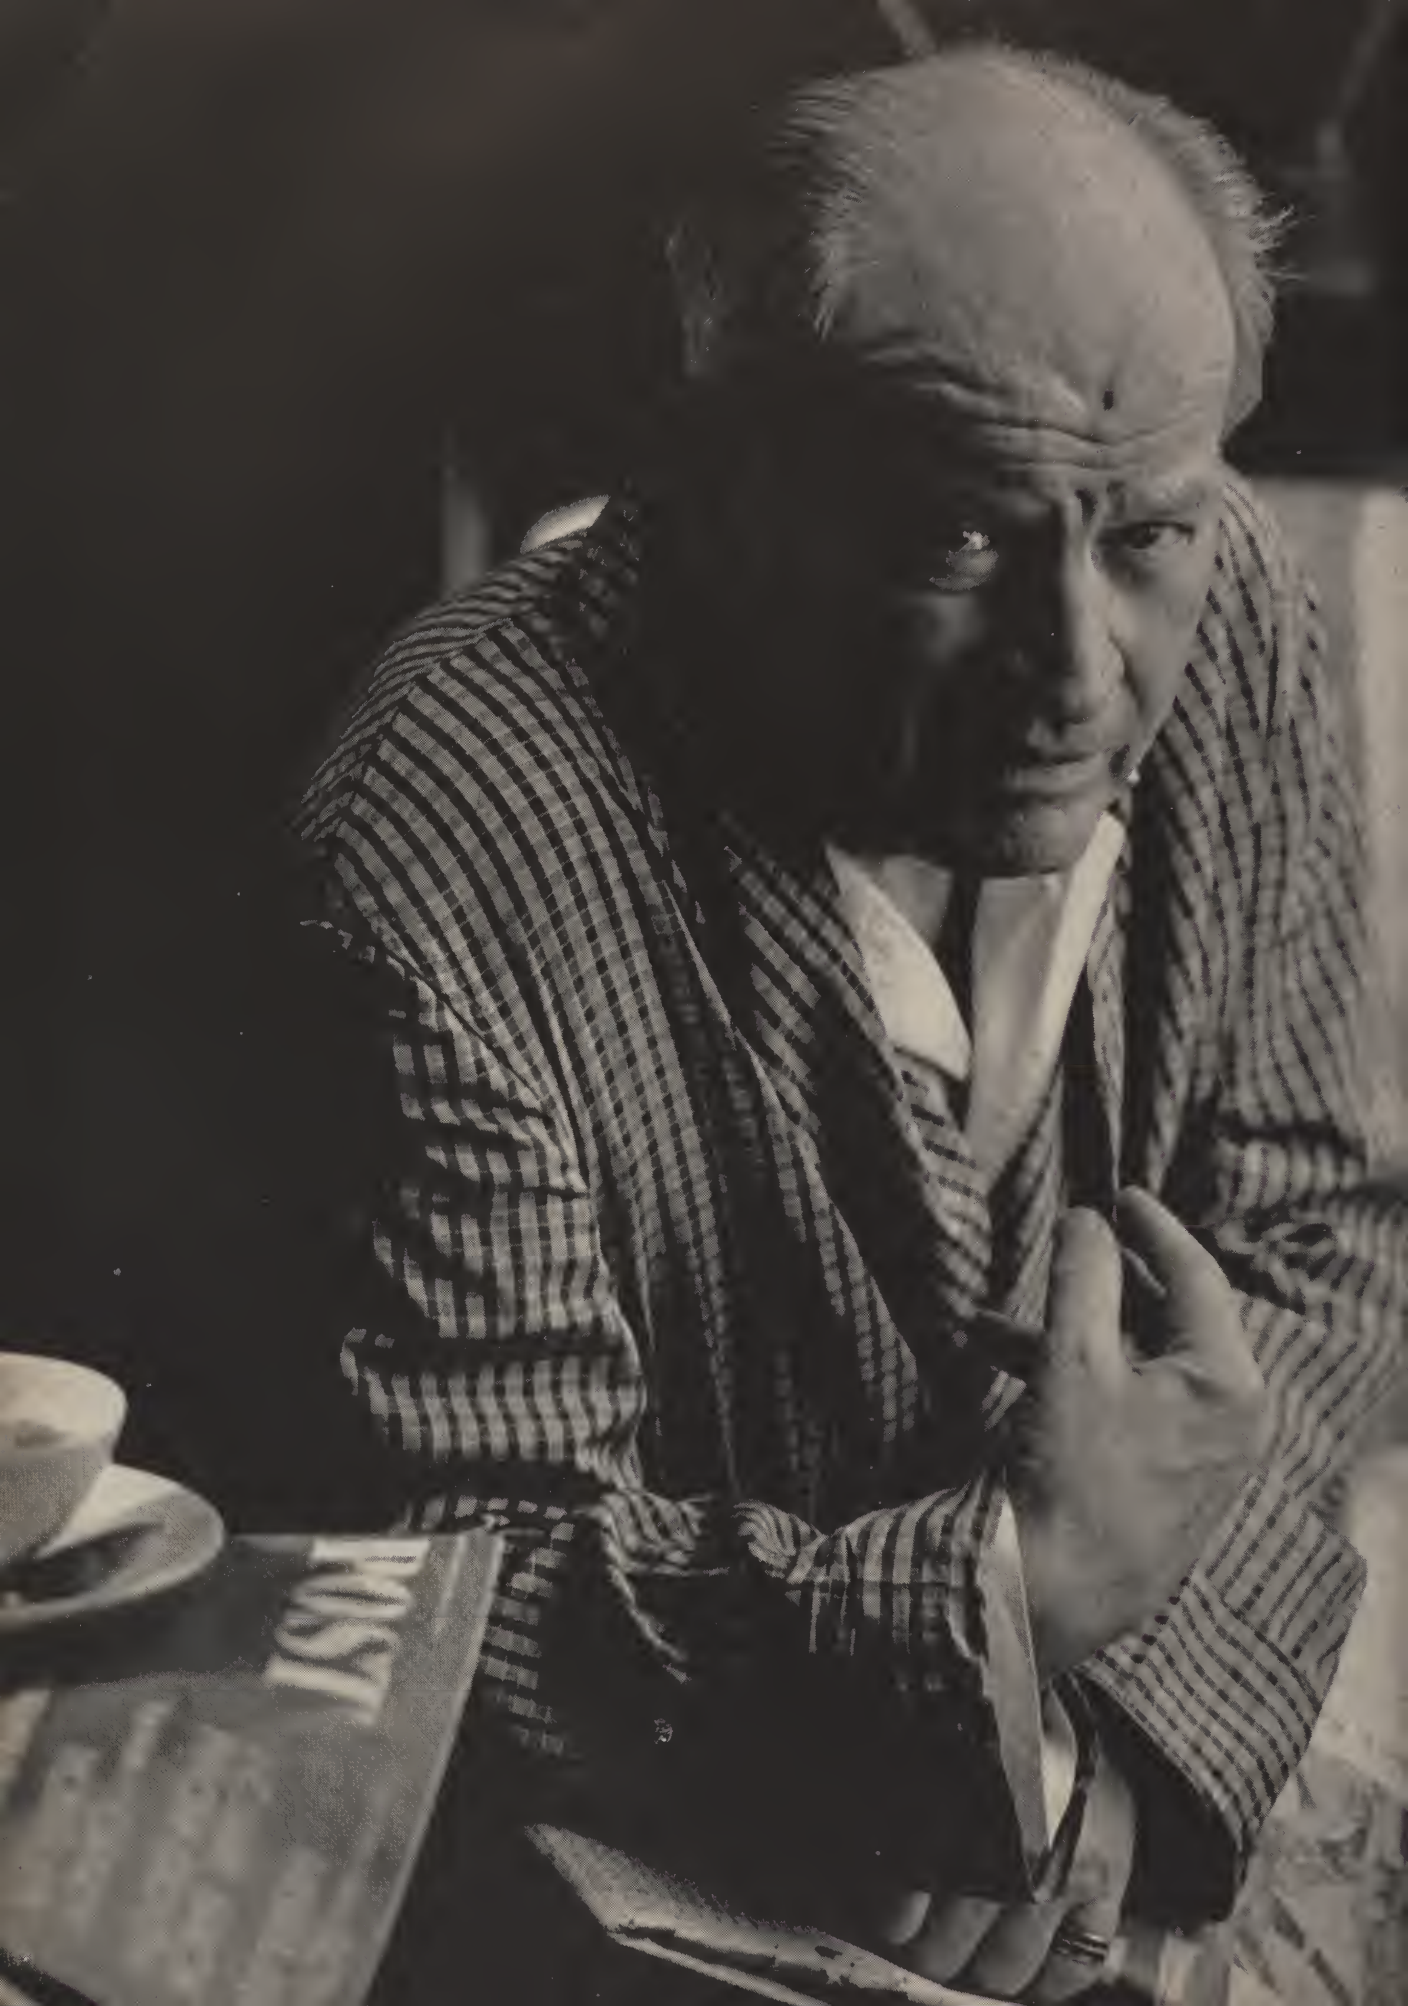
Alertonic®

Available Only On Prescription

Each 45 cc. (3 tablespoonfuls) contains: alcohol, 15%; pipradrol hydrochloride, 2 mg.; thiamine hydrochloride (vitamin B_1) (10 MDR*), 10 mg.; riboflavin (vitamin B_2) (4 MDR), 5 mg.; pyridoxine hydrochloride (vitamin B_6), 1 mg.; niacinamide (5 MDR), 50 mg.; choline,† 100 mg.; inositol,† 100 mg.; calcium glycerophosphate, 100 mg. (supplies 2% MDR for calcium and for phosphorus) and 1 mg. each of the following: cobalt (as chloride), manganese (as sulfate), magnesium (as acetate), zinc (as acetate), and molybdenum (as ammonium molybdate).

*Multiple of adult Minimum Daily Requirement supplied.
†The need for these substances in human nutrition has not been established.

Indications: 1. Functional fatigue such as that often associated with: a depressing life experience or stressful time of life; advancing years; convalescence; limited activity or confinement. 2. Poor appetite and vitamin-mineral deficiency as they occur in: patients having faulty eating habits; geriatric patients who are losing interest in food; patients convalescing from debilitating illness or surgery.



Contraindications: As with other drugs with CNS stimulating action, Alertonic is contraindicated in hyperactive, agitated or severely anxious patients and in chorea or obsessive compulsive states.

Side effects: Reports of overstimulation have been rare. Patients who are known to be unduly sensitive to the effects of stimulant drugs should be observed carefully in the initial stages of treatment.

Dosage: Adults, 1 tablespoonful; children (over 15 years old), 1 to 2 teaspoonfuls; children (4 to 15 years old), 1 teaspoonful. To be taken three times daily 30 minutes before meals.

MOSI

Posed by professional model

I'm supposed to get up and do things?

With my heart?

It's entirely natural—and may even be desirable—for the cardiovascular patient to be somewhat anxious about himself.

But when anxiety leads to unreasonable self-imposed limitations and restrictions . . . when it aggravates cardiovascular symptoms . . . when it interferes with restful sleep, measures to help alleviate the anxiety are probably in order.

One measure, of course, is reassurance. Another, adjunctive measure, is EQUANIL (meprobamate).

Over a decade of experience has shown that EQUANIL (meprobamate) is generally well tolerated as well as effective. Side effects are usually limited to transient drowsiness; serious, therapy-interrupting side effects are rare.

Cautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use may result in dependence or habituation in susceptible persons—as ex-addicts, alcoholics, severe psychoneurotics. After prolonged high dosage, drug should be withdrawn gradually to avoid possibly severe withdrawal reactions including epileptiform seizures. Side effects include drowsiness and, rarely, allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute non-thrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever have been reported. Meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Warn patients of possible reduced alcohol tolerance. Should drowsiness, ataxia, or visual disturbances occur, dose should be reduced. If symptoms persist, patients should not operate vehicles or dangerous machinery. A few cases of leukopenia, usually transient, have been reported following prolonged dosage. Other blood dyscrasias—aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia—have occurred rarely, almost always in the presence of known toxic agents. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. Prescribe very cautiously for patients with suicidal tendencies. Suicidal attempts should be treated with immediate gastric lavage and appropriate supportive therapy.

Contraindications: History of sensitivity to meprobamate.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

SYMPOSIUM ON SHOCK

The Symposium on Shock was held at the February 3 meeting of the Baltimore City Medical Society. All five participating physicians are from the Clinical Shock Trauma Unit, the University of Maryland School of Medicine. The articles presented here are based on the talks given in the Symposium. The subjects and the authors, in the order of presentation, are as follows:

A Study of Shock and Trauma in Man Utilizing the Resources of a Clinical Shock Trauma Unit—R Adams Cowley, MD
The Nature of Refractory Shock—Arlie R. Mansberger, Jr., MD
Coagulation in Human Shock—Safuh Attar, MD
The Treatment of Shock in a Research Facility—Joseph S. McLaughlin, MD
A Clinical Shock Trauma Unit Looks at Future Therapy for Patients in Shock—Elwood H. LaBrosse, MD, PhD

A STUDY OF SHOCK AND TRAUMA IN MAN UTILIZING THE RESOURCES OF A CLINICAL SHOCK TRAUMA UNIT

R ADAMS COWLEY, MD
Professor and Head, Division of Thoracic Surgery
University of Maryland School of Medicine

Severely injured individuals are constantly present in large general hospitals, particularly those associated with medical schools such as ours. While we do our best to treat these people, many deteriorate and die. Unlike most patients, who are hospitalized for acute or chronic disease and for whom some type of definitive therapy and care is planned, the accident- or emergency-ill victim becomes on admission an unwelcome patient since the hospital family is neither prepared nor geared to handle his emergency in a desirable manner. He is most likely to be seen by the least experienced house staff physician, the intern, during a period when time is of the essence and ripe clinical judgment is essential for his survival.

Today, shock and trauma therapy is often self-defeating for a number of reasons. Good care

From the Clinical Shock Trauma Unit, University of Maryland School of Medicine, Baltimore, Md. Supported by the US Army Medical Research and Development Command, Department of the Army, under Research Contact No. DA-49-193-MD-2229.

seems less than aggressive because young physicians who staff emergency rooms are ill-prepared to make even the first decisions that may be lifesaving. Decisions are often compounded by a compromise with inadequate treatment facilities, by harassment and pressure on a busy Saturday night with the intern, alone "on call," and by the impossibility of consultation because the senior staff member is busy in the operation room or treating another emergency on another floor. Could you, under these circumstances, provide care? Probably you could, but it would only be through mature *experience and judgment.*

Do you hear in your emergency room, "Get a chest x-ray!" and find the patient died while being turned on the x-ray table because an already stressed homeostatic system was thus overtaxed? Or, "Let's continue to watch the patient, he seems all right now," and know that precious minutes are lost at a point when rapid prophylactic resuscitation could have forestalled need for long, arduous refractory shock therapy? Do you hear, "Get the pressure up, start vasopressors!" and realize that he is reenforcing the vicious cycle of vasospasm while the lifesaving tissue perfusion ebbs away? Would not the simple technique of establishing a central venous pressure have given more information?

This present dilemma of emergency care can be expected because most medical schools have done little to teach trauma beyond minimal first aid and have structured student trauma education at the house staff level. Trauma and shock, as areas of special interest, have attracted few supporters.

The hospital attitude toward this problem is one of apathy in failing to provide the ancillary support so essential for proper care of the severely ill. Chemistry and blood gas laboratories are seldom available at night and on weekends when the incidence of accidental injury is greatest. Unavailability of proper x-rays, inadequate blood bank service, and the skeletal staffing of physicians and nurses on holidays and weekends, further handicap the *experienced* as well as the *inexperienced* physician.

These factors and many others perpetuate the same inadequate teaching, training and therapy experience year after year. It is little wonder, then, that young physicians who are so well trained in most other aspects of medicine are poorly equipped to make proper decisions for resuscitation and emergency care. In the event of disaster or war, their inexperience in this area could have a calamitous effect.

The public attitude toward tramua is one of indifference because in the experience of the layman the physical injuries that are seen are usually sudden, mutilating, distasteful, gruesome, and indicative of unlikely survival.* As a result, to the layman *perfunctory treatment is acceptable!* Many people are thus allowed to die by general consent since the physician, the hospital and the public have not accepted their responsibilities in trying to improve this desperate situation.

The total treatment of injured people on the basis of existing information is inadequate in most situations. Therapy continues to fall into a pattern of guess-work because the physician is unable to study the trauma patient who fails to respond to treatment. Scientific study and observation, along with good care, are synonymous with good therapy and the right of every patient. Inability to collect scientific information on what is taking place under conditions of therapy can only result in mediocre patient care. If scientific observations are not made during this period, the experience is lost and the physician is really not accepting his responsibility to the patient for he cannot otherwise guide therapy in the direction of decreasing mortality and morbidity due to accidental injury. Would it not be better if our profession solved the problem by converting all available resources into a plan for emergency care?

Awareness at the University of Maryland School of Medicine of problems related to injury and shock has resulted in the establishment of a Clinical Shock Trauma Unit (CSTU) to study the physiological, immuno-bacteriological and biochemical responses to injury in man. This unit has been in operation for the past four years. Since as far back as 1956, however, an extensive study of shock and its mechanism has been the major research interest of Dr. Robert W. Buxton and the Department of Surgery. The studies were initially limited to the animal experimental laboratory. As they progressed, two important factors became evident: (1) Although animal experimental work was necessary for many base line and

---

* "Newspapers do not usually publish pictures of such injuries because they are horrifying and shocking to the public—people do not like to see them."—Sterling Noel, editor, *Baltimore News American.*

model studies, variance in response of different species indicated the necessity to study shock in man more directly; and (2) in order to understand the overall structural patho-physiological, immuno-bacteriological and biochemical alterations occurring in the organism, it was necessary to expand the program to include multidisciplinary support in order to explore effectively the basic phenomena occurring at the cellular level.

To date, we have studied shock in man with complementary support from animal investigation. The main features of the study are: (1) elucidation of physiologic and biochemical mechanisms of clinical shock, (2) development of therapeutic regimens, and (3) research and development of preventive measures.

The mechanisms of operation have included: (1) establishment of a Clinical Shock Trauma Unit for resuscitation, where pertinent data on trauma patients is collected on a 24-hour basis, and (2) modification of the animal research program in order to provide experimental data needed for support of observation in humans. Both the CSTU and the animal research program are operating effectively and, as a result, we have a large amount of previously unobtained clinical, physiological and biochemical data on patients in various types and stages of shock.

Preliminary analysis of the data already shows that it is not only feasible to study a state of a patient as manifested by various measured parameters, but it is also possible to investigate dynamic changes of these parameters and their mutual interdependence. This was our primary objective in collecting the data and required an extensive data analysis program.

Since inception of the study in January, 1962, over 300 patients in various stages of shock have been studied as they have undergone resuscitation measures. Some of our results have already been reported.[1-14] We believe we have proven that patients can be successfully studied during resuscitation; we have also demonstrated that the techniques developed and used have done much to improve therapy and to increase the survival rate. These experiences with the present CSTU now permit more complex studies of the physio-biochemical response to injury in man and constitute a solid basis for a second and even more fruitful phase of shock and trauma research. Hypotheses already formulated will now permit more efficient and more purposeful collection of data. Further analysis of both available and new data continues to yield additional tests of the formulated hypotheses and will lead to new conjectures that will make future shock research more challenging.

Steps taken by our group are only initial steps in specific areas of this neglected disease of modern society.[28] The responsibility for proper care of the emergency-ill lies with us all.

THE NATURE OF REFRACTORY SHOCK

ARLIE R. MANSBERGER, JR., MD
Associate Professor, Department of Surgery
University of Maryland School of Medicine

Shock may be defined as a state of decreased perfusion associated with certain pathophysiologic and biochemical changes which are self-perpetuating and which, if uncorrected, lead to gradual deterioration of the patient. Much thought has been given in recent years to the effect of catecholamines on the peripheral vascular bed and there is healthy academic disagreement regarding mechanisms of response of the distal peripheral vascular components to the effects of increasing intravascular catecholamine titers. For example, capillary stasis in the later stages of shock has been attributed by some to the existence of venular sphincters that remain closed in response to endogenous pressor substances after the precapillary sphincter has relaxed. Others point out that this same stasis may be due to purely mechanical factors such as the Bernoulli effect on the thin walled venules secondary to lowering of venous pressure and the relaxation of arteriolar resistance.

However, there seems to be some general agreement among investigators in the "shock arena" that most low flow states, including shock from trauma, hemorrhage, sepsis and myocardial inadequacy, are associated with rising catecholamine titers and capillary ischemia, and with a later phase of stagnant hypoxia and plasma sequestration. Further, it is the consensus that data seem to relate the level of catecholamines not only to the severity of the low perfusion state, but also to the length of time it has persisted.

In any event, it would seem that closure of the arteriolar sphincter and the opening of arteriovenous (A-V) shunts must, of necessity, be associated with a change in the pressure relationships affecting the capillary so that the osmotic pressure would exceed the hydrostatic pressure and the net flow of volume would be from the extracellular space into the capillary. Since extracellular fluid has relatively little protein content, the net effect of extracellular fluid ingress should be a relative increase in water content, and a relative decrease in total protein, specific gravity and viscosity of fluid within the capillary. The above mentioned mechanism would seem to be a protective effort designed to enhance intravascular volume and ultimately capillary flow if the factors responsible for the hypotensive episode were corrected at this point in time.

Bypassing of capillaries results initially in ischemic hypoxia and, in order to survive, the cell must resort to anaerobic metabolism. The resultant increase in pyruvic acid and lactic acid (according to the formula DPNH and pyruvic acid $\rightleftharpoons$ lactic acid plus DPN) results in an environment of peripheral metabolic acidosis. The lowered pH is associated with a decreasing peripheral response to catecholamines, and increased amounts of norepinephrine and epinephrine are elaborated by peripheral sympathetics and the adrenal medulla, respectively. Continuation of the above phenomena with increasing acidosis eventually results in inability of the arteriolar sphincter to maintain tone in spite of dramatic increase in catechol levels. The resultant loss of arteriolar tone allows for the inflow of arterial blood into the capillary bed at the same moment the outflow is impeded by one of the mechanisms mentioned earlier in this discussion. Regardless of the mechanism responsible (and this author tends to favor the mechanical pressure effects rather than the theory of venular sphincter response to catecholamines) the net functional result is identical to that of a closed anatomical venular sphincter.

At this point in time of the shock cycle, the pressure relationships again change so that the hydrodynamic pressure within the capillary is greater than osmotic pressure and the net effect is the egress of intravascular fluid into the extracellular space. This phase, which might be called a phase of sequestration edema, is of course accompanied by "stagnant hypoxia," which further potentiates acidosis. The composition of the seques-

From the Clinical Shock Trauma Unit, University of Maryland School of Medicine, Baltimore, Md. Supported by the US Army Medical Research and Development Command, Department of the Army, under Research Contract No. DA-49-193-MD-2229.

tered fluid is predominantly water and electrolytes, since the larger molecular weight structures and red cells remain within the capillary. The increase in the viscosity of blood which occurs as a result of this sequestration phenomenon enhances rouleaux formation, sludging, and intravascular thrombosis. Intravascular thrombosis must in turn culminate in death of adjacent cellular structure and, of course, the ultimate in acidosis.

One of the known experimental effects of infused epinephrine is hepatic venous outflow obstruction and increased splanchnic bed inflow secondary to the opening of splanchnic A-V shunts,

The sum total of capillary stasis, sequestration edema, and splanchnic pooling, results in dramatic decrease in venous return, cardiac output and coronary flow. Cardiac efficiency is decreased in the presence of metabolic acidosis. Cardiac function eventually deteriorates to the point where cardiac arrest and/or fibrillation occur.

In 1966, we reported the findings of metabolic studies resulting from reversible low flow states in the human extremity prior to, during, and subsequent to, aortic cross clamping.[1]

In 15 patients undergoing elective resection of atherosclerotic aneurysms of the abdominal aorta, the femoral artery and vein of one extremity were exposed through a separate inguinal incision. Immediately prior to aortic and iliac artery cross-clamping, aliquots of blood were removed for study. Additional arterial and venous samples were obtained 30 minutes following occlusion, immediately prior to release of the cross clamps, and at 1 to 5, 10, 20 and 30 minute intervals following restoration of arterial continuity. Micro-techniques of the Astrup analyzer were utilized for the determination of pH, pO_2, pCO_2, standard bicarbonate, base excess and buffer base in all patients. O_2 saturation was calculated from the pH and pO_2 values. The method of Barker and Summerson was utilized to measure lactate levels, and pyruvate levels and were determined by a modified Friedman and Haugen technic. Excess lactate was calculated according to Huckabee:

$$\text{Excess lactate (XL)} = (L_n - L_o) - (P_n - P_o)\,(L_o/P)$$

L_o and P_o are control lactate and pyruvate

L_n and P_n are experimental lactate and pyruvate

In eight patients the serum water concentration, serum specific gravity and total proteins were

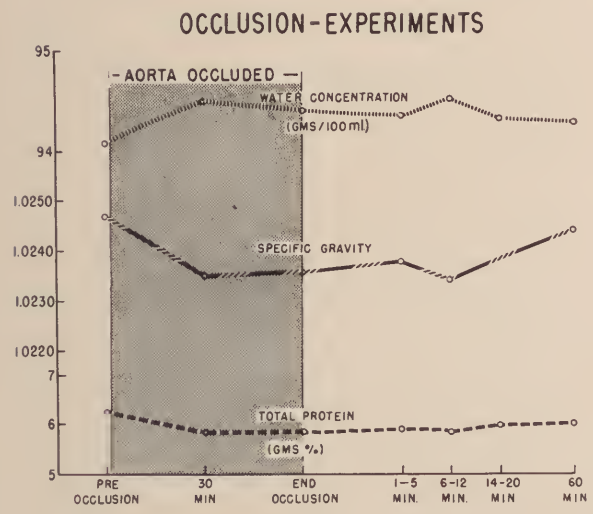

Fig 1

Mean values from femoral vein of eight patients illustrating fall in specific gravity and total protein and rise in water concentration suggesting net flow of interstitial fluid into capillary bed during occlusion.

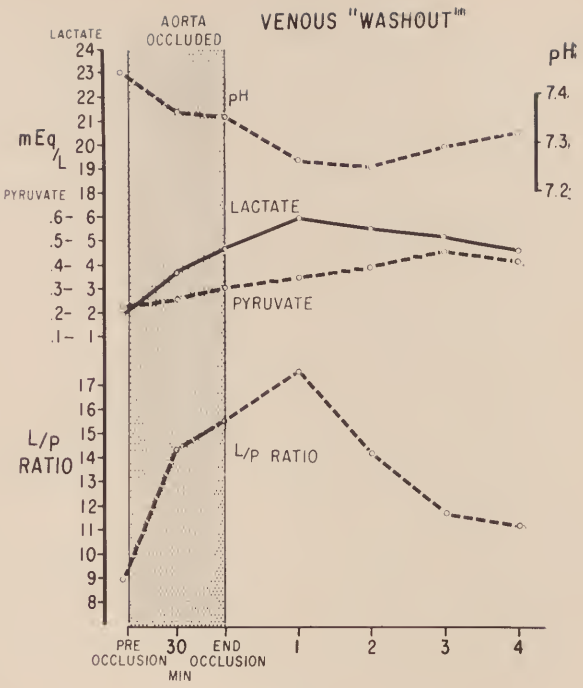

Fig 2

Mean values (total patient group) in femoral vein blood for lactate, pyruvate, L/P ratio and pH prior to and during occlusion, and at 1 to 5, 10, 20 and 30 minute intervals following aortic clamp release.

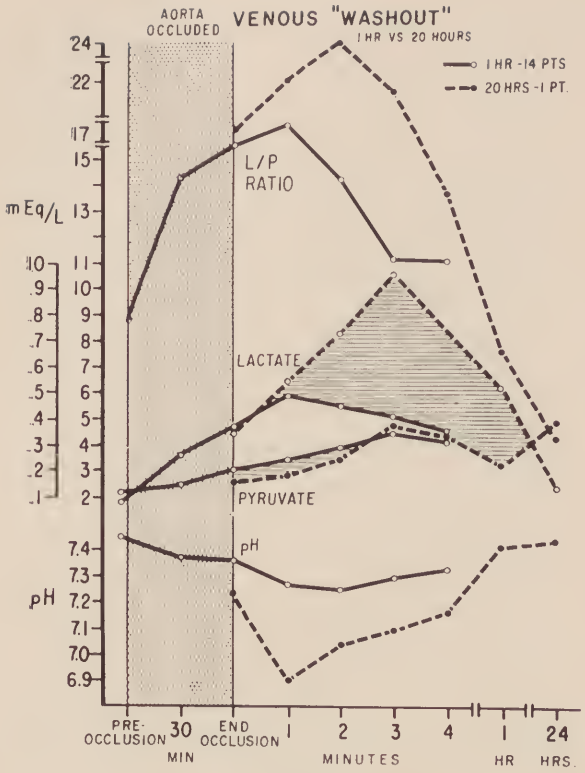

Fig 3

Illustrates the differences in femoral vein blood values for pH, lactate and L/P ratio between the mean of the total patient group and a single patient whose inflow was occluded for a total of 20 hours. (Sample times are as described in text.)

determined from the serum refractive index utilizing a total solids meter. Serum sodium, potassium, chloride and magnesium levels were analyzed in six patients by standard laboratory methods.

Halothane anesthesia was utilized on all patients following induction by pentothal, nitrous oxide and oxygen. Ten patients had intravenous infusion of commercial dextran into the upper extremity at a rate of 2.5 cc/kg body weight per hour. Five patients were infused with crystalloid solution only (5% dextrose in water).

Also studied was the venous "washout" of one additional patient who had successful restoration of arterial continuity following 20 hours of occlusion (inadvertant ligation of the right iliac artery during a left hemipelvectomy). One baseline arterial inflow sample only was obtained on this patient. Aliquots of blood obtained were analyzed as outlined in the preceding studies.

The results of these studies need not be belabored here since they have already been reported in detail.[1] A glance at Figs 1 through 5, however, suggests that metabolic changes resulting from decreased perfusion states include:

1. The accumulation of significant amounts of acid metabolites as evidenced by a significant fall in venous pH (Fig 2).
2. Significant elevation of the absolute value of lactate and pyruvate and of excess lactate during decreased perfusion (Fig 2).
3. A precipitous fall in serum specific gravity and serum protein concentration with concomitant elevation of serum water concentration (Fig 1).
4. A demonstration that metabolic changes resulting from ischemia are time-related (Fig 3).

The dramatic rise in venous pO_2 in control patients when compared to dextran-infused patients suggests not only the presence of A-V

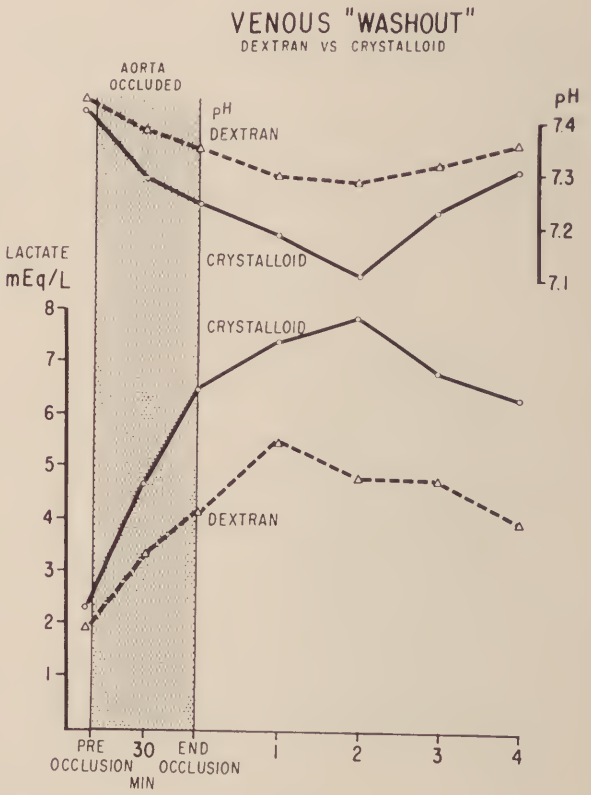

Fig 4

Illustrates differences in mean values in femoral vein blood for pH and lactate in those patients infused with dextran and those not infused with dextran. Post-release samples obtained at 1 to 5, 10, 20 and 30 minute intervals.

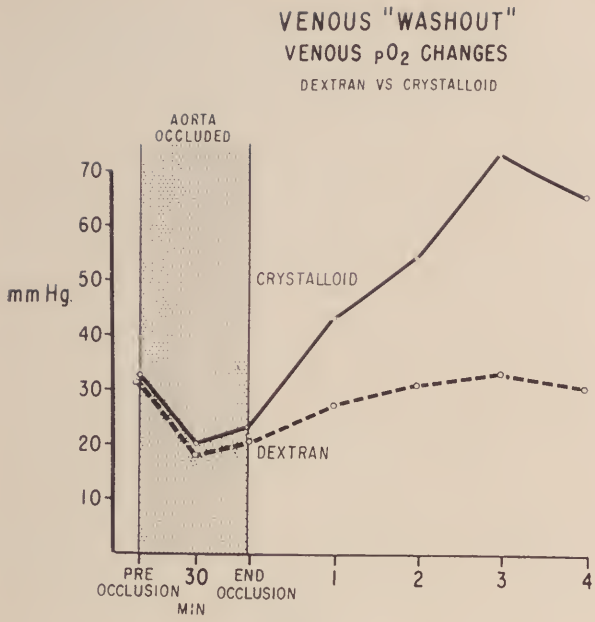

Fig 5

Comparison of mean venous pO_2 values (from femoral vein) in dextran-infused versus crystalloid-infused groups. Note post release increase in the latter group to values approaching those for arterial blood, suggesting the presence of A-V shunt in the human extremity. (Sample times are as described in text).

shunts in the human extremity, but also the efficacy of dextran in enhancing capillary flow (Fig 5). It is noteworthy that the venous pO_2 levels of those patients infused with dextran did not rise significantly, and at the same moment the metabolic changes were less severe, indicating enhancement of capillary perfusion and thus less need for dependence upon anaerobic metabolism (Figs 4 and 5).

These experimental findings would seem to enhance, at least in part, the validity of the thesis presented in the foregoing discussion on the nature of refractory shock.

The treatment of patients in refractory shock would seem to be best managed not only by avoiding the use of vasopressor drugs (except those which are pure beta adrenergic stimulators and thus enhance cardiac output), but also by altering the millieux for response to the patient's endogenous catecholamines, which are already present in adequate amounts.[2]

COAGULATION IN HUMAN SHOCK

SAFUH ATTAR, MD
Associate Professor, Department of Surgery
University of Maryland School of Medicine

The importance of altered hemostatic mechanisms and proteolysis in the pathogenesis and evolution of the shock syndrome has become apparent in our multidisciplinary approach to the problem of shock. Evidence for altered hemostasis in shock has been available in the experimental animals, but scarce in humans. The thesis of disseminated intravascular coagulation is advanced to account for altered hemostasis and hypercoagulability in shock, which ultimately leads to irreversible changes and death. This report is concerned with the study of alterations in coagulation and fibrinolysis in shock patients, the mechanisms leading to these changes, and therapeutic methods of altering such changes in order to improve the care and survival of shock patients.

This investigation was supported by the US Public Health Service Research Grant No. HE 09341-03 and by the US Army Medical Research and Development Command, Department of the Army, under research contract No. DA-49-193-MD-2229, and is from the Clinical Shock Trauma Unit, University of Maryland School of Medicine, Baltimore, Md.

Methods and Materials

Coagulation studies have been performed on more than 200 patients admitted to the Clinical Shock Trauma Unit (CSTU) of the University

of Maryland Hospital. The types of shock studied were: hypovolemic, septic, cardiogenic, toxic, and mixed type. A patient was considered in shock when the systolic arterial blood pressure was less than 90 mm Hg in the presence of acidosis, impaired renal function, bacteriological evidence of sepsis (septic shock), hypovolemia due to fluid and/or blood loss manifested by low central venous pressure that responds adequately to volume replacement (hypovolemic shock). Cardiogenic shock was defined as hypotension secondary to myocardial infarction, arrythmia or post-cardiac arrest.

Soon after admission to the CSTU, patients were cannulated and arterial samples were obtained initially and every six hours thereafter during the critical period. Blood samples were obtained once daily after stabilization of the clinical condition, until discharge or death.

Blood samples were obtained for the following studies:

A. Coagulation Studies
   1. silicone clotting time (Lee-White)
   2. fibrinogen
   3. prothrombin time
   4. partial thromboplastin time
   5. platelets
   6. platelet adhesive index
   7. clotting factors
   8. thromboelastography

B. Fibrinolytic Studies
   1. euglobulin lysis time
   2. plasminogen
   3. fibrin plate method of Astrup using heated and unheated plates
   4. Bradykinin

Data Analysis

A. Coagulation Studies

1. *Silicone clotting time*—Clotting time data were expressed in terms of a clotting index C, defined as follows: $C = \frac{T - Tn}{Tn}$ where T is the observed clotting time, and Tn is the normal clotting time. In this report the value chosen for Tn is 37, which is the rounded off mean of the range of 25 to 50 minutes. Clotting indices were plotted against time of sampling during and after the episode of shock. A complex of curves was obtained which, after curve fitting, resulted in Fig 1. A close examination of these curves shows that an oscillatory pattern of hypercoagulability followed by hypocoagulability could be demonstrated in all types of shock. In surviving patients, the changes in clotting times were less marked than in fatal cases, and returned to normal values upon recovery. In the fatal cases, clotting times were altered markedly following the same pattern of hyper- and hypocoagulability.

2. *Fibrinogen*—Changes in fibrinogen were triphasic. There was an initial decrease in the fibrinogen level followed by a marked and sustained elevation, especially in septic shock patients. This elevation returned to normal levels earlier in hemorrhagic shock patients than in patients with septic shock. A decrease of fibrinogen level to values ranging from 60 to 90 mg% was frequently associated with clinical deterioration and death in the types of shock studied.

3. *Prothrombin time*—This was a sensitive index of the clinical behavior of the shock patients. A gradually decreasing prothrombin activity below 40% of the control was invariably serious and was associated with a fatal outcome when it dropped to 30% or lower.

4. *Partial thromboplastin time*—This was used as a screening test for factors involved in the intrinsic prothrombin activation (V, VII through XII) (normal value between 78 and 90 seconds). In septic shock patients it was 117 $\pm$ 8.6 seconds in the survivors, as compared with 169.75 $\pm$ 14.98 seconds in the fatal group ($P<0.01$). It was also prolonged in cardiogenic shock: 157 $\pm$ 53 seconds in the survivors, as compared with 132 $\pm$ 14 seconds in the fatal group (not statistically significant).

5. *Platelets*—Platelet counts were made on whole blood, using phase contrast microscopy. The shock patients usually had counts below the normal range of 200,000-400,000 per mm,^{3} but the differences between the types of shock or between the survivors and non-survivors were not statistically significant.

6. *Platelet adhesive index*—The Platelet Adhesive Index (PAI) was obtained by counting the platelets in whole blood before and after passing 1 ml of blood through a tube containing 1 gm of glass beads. The shock patients often had PAIs (percent decrease in count) beyond the normal range of 25% to 60%, but the differences have

not been statistically significant because of large variations.

7. *Clotting factors*—These include Factors V, VII, VIII, IX, X, XI, XII and XIII. Multiple deficiencies were noted during shock, but were corrected toward normal with recovery, using blood, plasma or plasma concentrates.

8. *Thromboelastography*—The Hartert thromboelastograph[4] was used. This instrument registers completely the kinetics of fibrin clot formation, firmness, retraction and dissolution, and produces a permanent record. A close correlation has been obtained between the clinical progress of patients in shock and serial thromboelastograms. Fig 2 illustrates thromboelastograms of a 45-year-old woman who developed hypofibrinogenemia, shock and renal shut-down following delivery of a retained dead fetus. She did not respond to intensive fibrinogen therapy. Coagulation and fibrinolytic studies showed severe fibrinolysis that responded well to the antifibrinolytic agent, Epsilon-Amino-Caproic Acid.

B. Fibrinolytic Studies

An increase in fibrinolytic and proteolytic activity was demonstrated in all types of shock studied. The euglobulin lysis time which reflected changes in activator activity was markedly shortened during shock and gradually returned to normal values ($>$ 120 minutes) upon recovery. The same changes were reflected in the fibrin plate method and plasminogen determinations. Bradykininogen levels were also markedly decreased in shock patients, denoting its conversion to bradykinin, which is the most vasoactive polypeptide in the body and contributes significantly to the production of hypotension. Bradykininogen levels returned to normal or higher values during the recovery period, whereas it remained low in fatal patients.

Discussion

Significant alterations in the coagulation and fibrinolytic activities have been demonstrated in patients in hemorrhagic, septic, toxic and cardio-

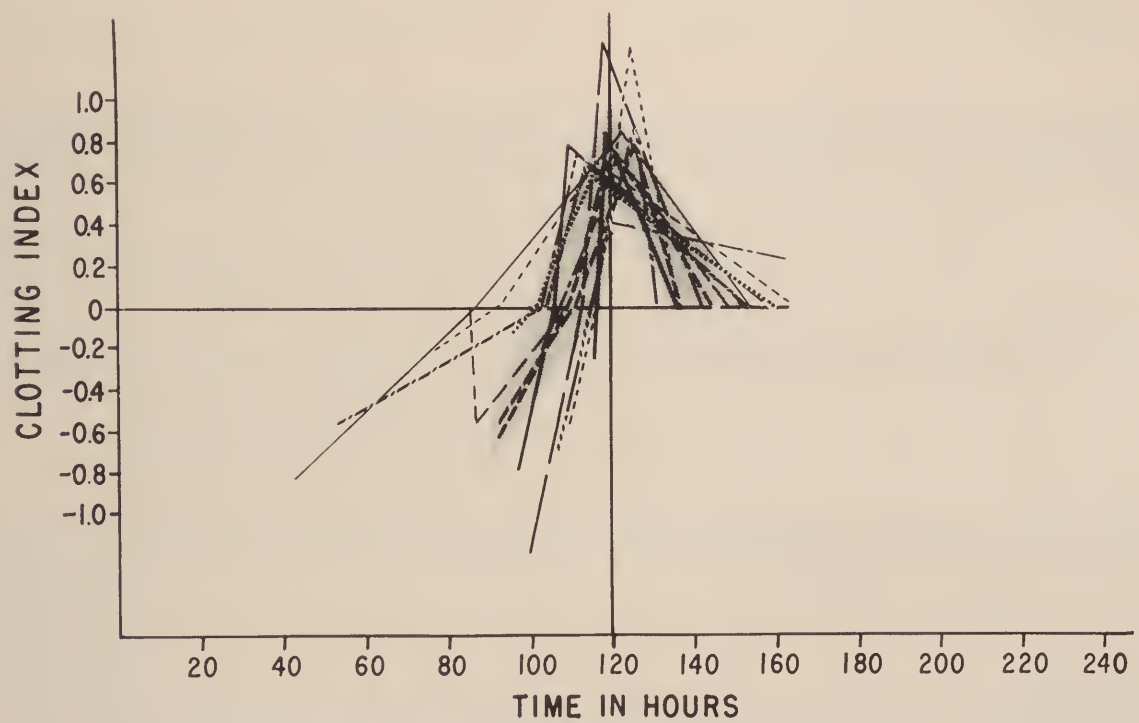

Fig 1
Clotting indices versus time in hemorrhagic shock patients who survived.

genic shock. These changes follow an oscillatory behavior with a reproducible pattern, dependent on the severity and duration of shock. The behavior of normal clotting is assumed to be an oscillatory one with small amplitudes. This is not demonstrated in our patients since they are seen after the onset of shock. Patients in shock exhibited an oscillatory pattern with higher magnitude and frequency. In surviving patients the pattern returned gradually to the assumed normal, whereas in the fatal patients the oscillations increased in amplitude and frequency. The interpretation of these oscillations in the coagulation mechanism in shock is rather difficult, since they represent the interaction of various opposing factors. The initial episode of hypercoagulability can be explained on the release of catecholamines and thromboplastic materials following lysis of platelets, plasma dilution of anticoagulant inhibitors, and early manifestation of the activation of the fibrinolytic enzymes. The hypocoagulable phase is as complex to explain as the phase of hypercoagulability. Following the hypercoagulable phase there is evidence of decrease of the clotting element, probably due to inadequate production by the liver, in the face of increased utilization. The increased anticoagulant and fibrinolytic activity contributes also to the consumption of the clotting factors, thus leading to hypocoagulability.

These coagulation and fibrinolytic studies not only are of diagnostic and prognostic significance, but also contribute to the management of patients in shock. Patients who exhibit marked hypercoagulability with evidence of disseminated intravascular clotting should be treated with anticoagulants, heparin, dextran, in contradistinction to patients in shock who manifest bleeding secondary to fibrinolysis. The latter has been treated effectively with antifibrinolytic agents such as epsilon-amino-caproic acid or trasylol. It is essential, however, to point out that serial coagulation and fibrinolytic studies are necessary for the proper management of this aspect of shock, since the pattern of clotting is varying rapidly with the progress of the shock state.

Summary

Analysis of coagulation and fibrinolytic studies in 200 patients in hemorrhagic, septic and cardiogenic shock is presented. An oscillatory behavior

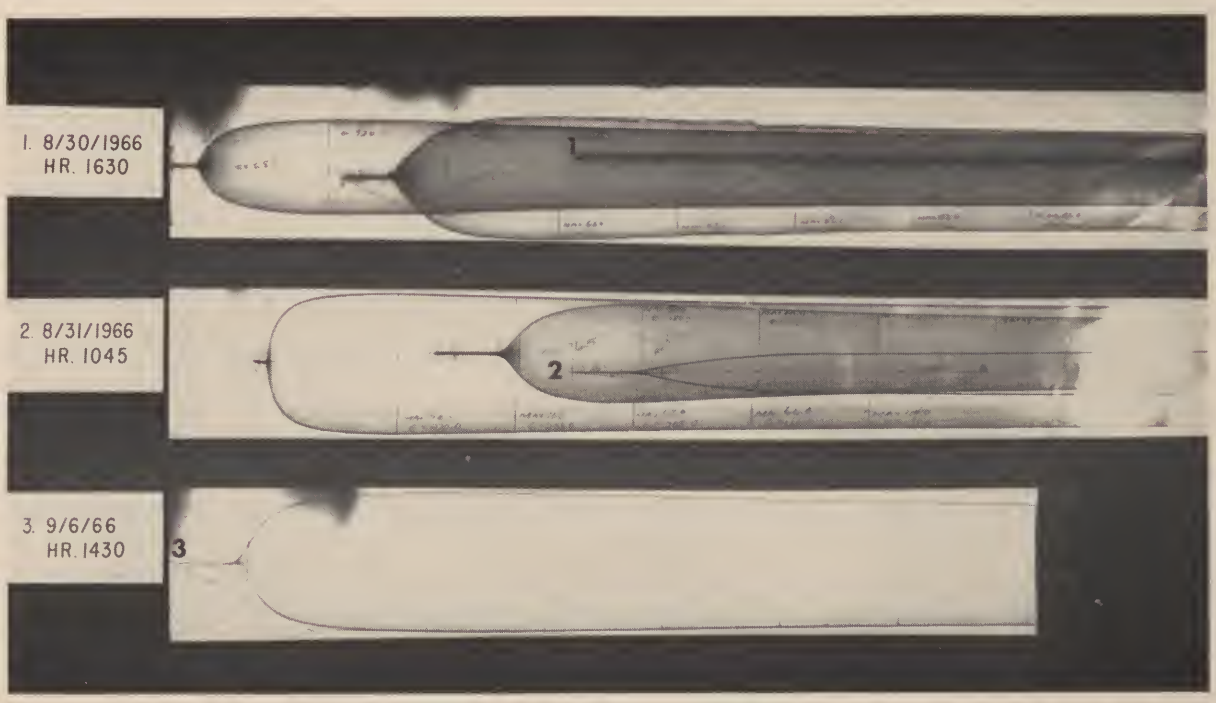

Fig 2
Thromboelastograms showing hypocoagulable blood in (1), with a poor clot, which has improved in (2), and normal clot formation in (3).

of the clotting mechanisms has been demonstrated. Although the same general pattern is obtained in fatal and non-fatal shock, the final outcome can be predicted by the amplitude and frequency of the oscillations. A prolongation of the silicone clotting time—frequently to unclottability, a significant decrease in fibrinogen, prothrombin activity, and marked reduction of clotting factors with markedly shortened euglobulin lysis time, were associated with a fatal outcome.

THE TREATMENT OF SHOCK IN A RESEARCH FACILITY

JOSEPH S. McLAUGHLIN, MD*
Assistant Professor, Department of Surgery
University of Maryland School of Medicine

During the past four years of operation, the Clinical Shock Trauma Unit at the University of Maryland Hospital has demonstrated that the detailed study of numerous physiologic and biochemical processes can be carried out simultaneously and in conjunction with the therapy of critically ill patients. Indeed, the survival rate in the study group has been superior to that generally reported. Important information of basic scientific interest, as well as clinical and therapeutic knowledge, has been uncovered and this information has been and is being disseminated to the scientific community.

The feasibility of a clinical research area incorporating various medical and paramedical disciplines has been demonstrated. Within the next year, construction of a Shock Trauma Center incorporating an acute care facility, an operation room area with research facilities and an intensive care unit, will be initiated. This facility will provide the investigator with an opportunity to follow the patient during the complete course of his acute illness. Many of the research projects now being carried out in the Clinical Shock Trauma Unit will be continued in an expanded or extended manner. Other projects, heretofore not feasible, will be undertaken.

Parenthetically, the therapeutics of trauma are equally dynamic and improve as more fundamental descriptions are made. The University of Maryland Shock Trauma Center will provide the means of investigating trauma in depth without endangering the patient and, if past experience prevails, actually will increase his chances for survival.

The approach to shock therapy that is presently used in our unit is an uncomplicated one that can be carried out in any well-equipped general hospital and concerns itself with correction of four major factors: (1) the primary process, (2) volume deficits, (3) acid base and electrolyte abnormalities, and (4) specific organ failure.

Correction of the primary process: No system of treatment is completely adequate unless the

primary process or cause of injury is corrected; therefore, appropriate measures to define and correct the primary process should be undertaken immediately. This should include a review of the history and physical findings and the appropriate laboratory data. Further, a tentative plan for treatment or, if indicated, additional investigation should be formulated.

Shock may be produced by a variety of mechanisms ranging from severe mechanical trauma to the entrance of bacteria and their toxins into the blood stream. At times, the primary process is obscure and only at a later date does the etiology of the shock episode become clear. This is particularly true in the case of septic shock. If definition of the primary process is not possible, septic shock must be suspected and appropriate frequent cultures of blood, urine and sputum obtained. Septic shock usually has been on the basis of gram negative organisms, often from the genitourinary tract; however, in recent years, the staphylococcus has been increasing in frequency as an etiologic agent. Wide spectrum antibiotics are administered intravenously. We utilize a combination of chloramphenicol and "staph-cidal" penicillin (Staphcillin®) in septic shock, or in shock of obscure etiology, until the cultures and sensitivity studies indicate that a change is in order.

Hydrocortisone in pharmacologic doses is indicated in patients in septic shock who do not respond to usual measures. This is not based on the treatment of adrenal insufficiency. Indeed, levels of cortisol in patients in shock are usually elevated, but experimental work by Lillehei et al has indicated that such dosages increase capillary perfusion by increasing cardiac output and decreasing arteriolar constriction.[1]

Correction of volume deficits: Except in the presence of heart failure, central venous pressure (CVP) has proven the most reliable measure of fluid therapy. Central venous pressure can be safely and accurately determined through a plastic cannula percutaneously inserted into the subclavian vein. The pressure is determined by the height of a column of saline adjusted to zero at the atrial level. Normal pressures in this system vary from 0 to 5 cm of saline; however, in the seriously ill patient in shock, the pressure must be higher if adequate circulation is to be produced. For pressures below 10 cm of saline, volume expansion is indicated. If the CVP is 10-15 cm saline volume expansion is usually indicated, but with a more cautious infusion, and a careful appraisal of the heart and lung status is carried out. A CVP above 15 cm of saline usually indicates myocardial failure and fluid replacement is counterindicated until this and other factors are evaluated and treated.

We have performed subclavian cannulation over 400 times without serious complication. Pneumothorax was produced twice: in both instances the problem was recognized by routine auscultation of the chest and appropriate measures corrected the problem.

The choice of an initial fluid depends on the type of shock present; however, it is generally agreed that colloid-containing solutions are indicated in most instances. This is based on experimental evidence demonstrating that the fluid lost or sequestered by the body in shock closely resembles plasma. In addition, there is much clinical data supporting the great value of colloid solution in a variety of shock states. Plasma is therefore infused in sufficient quantities to bring the arterial and venous pressure to acceptable values. Blood is substituted as soon as it is available in hemorrhagic shock and electrolyte solutions are added to the infusions as indicated. The choice of crystalloid solutions is dependent upon the patient's clinical state and the laboratory measurement of blood electrolytes. Buffered saline (Ringer's Lactate Solution) has considerable merit as an initial crystalloid solution and when infused simultaneously with plasma provides not only electrolyte, but free water for renal excretory function.

Correction of acid base and electrolyte abnormalities: The patient in shock usually is acidotic. The acidosis may be primary, ie, due to cation loss with body fluid, or secondary, ie, decreased tissue oxygenation leads to aneurobic metabolism and the production of acid radicals. Severe metabolic acidosis produces a decreased cardiac output and contributes to the viscous cycle of organ degeneration. This decrease in cardiac output has been well documented in animals and has been demonstrated to exist in a group of patients in shock studied in our Unit by Khazen.[2]

Treatment of acidosis is dependent upon improved tissue perfusion and oxygenation. Frequently volume infusion and adequate ventilation

are sufficient to return the acid-base balance to normal, the body ridding itself of the excess acid radicals through the lungs and the kidneys by the usual mechanism. However, in severe acidosis, where the normal compensatory mechanisms are maximally stressed, the infusion of base is necessary. Sodium bicarbonate is a logical agent since sodium stores usually are depleted and the bicarbonate ion is easily incorporated into the body's buffer system and subsequently excreted by the lungs. The Siggaard Anderson Curved Nomogram is utilized to estimate the base deficit, and the calculation of the amount of bicarbonate required to correct the metabolic acidosis, based on the Astrup formula for "bicarbonate space," has proven extremely reliable in the acutely ill patient.[3] Theoretical objections to this method exist, but in practice the correlation between the amount of sodium bicarbonate administered and the correction factor is exceedingly good. Our practice is to correct the acidosis using a solution of 1 mEq of sodium bicarbonate per ml of water slowly administered intravenously by hand injection.

Electrolyte abnormalities are common and are dependent upon the primary process, iatrogenic losses such as gastric suctioning, and mandatory and compensatory excretion by the body. Frequently educated estimates of these losses can be made from the patient's clinical status and the history. However, exact measurements of these abnormalities and their correction depend upon the biochemical laboratory as well as the measured output.

One of the more common electrolyte abnormalities in refractory shock is hyponatremia. While this may be produced by a variety of mechanisms, it is not uncommonly the result of the infusion of sodium-free fluids used as a vehicle for antibiotics, vasopressors and other medications during the post-traumatic antidiuretic period. Hyponatremia is associated with a decreased peripheral vascular response to epinephrine infusion in the experimental animal. In a recently reported series of refractory shock patients, a favorable response to concentrated sodium solutions was demonstrated.[4]

Correction of specific organ failure: The fourth factor in therapy are those efforts directed toward specific organ failure. The four organ systems usually affected are the heart, the lungs, the kidneys and the liver (reticuloendothelial system). Equally important is the fact that each of these organ systems initially may suffer only functional damage and, if properly supported, may demonstrate significant recovery.

The inability of the liver to perform many of its tasks during shock is well known. Carbohydrate and protein metabolism are affected and the body's major detoxification apparatus becomes non-operational. Attar has demonstrated marked impairment of the coagulation mechanism in the human in shock and Ollodart has shown a decrease in bacterial defense mechanisms in many of the same patients.[5, 6]

The principles of the treatment of hepatic failure are well known. In liver failure associated with shock, the establishment of an adequate circulation is all that is generally required to correct the overall deficit. Certain abnormalities such as those in the coagulation mechanism may at times require more specific therapy.

Renal failure is such a common occurrence with shock that its non-presence casts doubt upon the diagnosis. Dr. Barry has postulated that renal failure is first functional and only later becomes organic.[7] If urine output can be established, the latter condition can be avoided and he suggests the use of the osmotic diuretic mannitol as a means of establishing such flow. We have demonstrated marked impairment in renal function in humans in shock and in addition, have shown that in survivors renal function improves rapidly with the re-establishment of adequate blood pressure.[8] The use of osmotic diuretics frequently has not improved urinary output in those patients who did not demonstrate improvement with re-establishment of adequate circulatory dynamics and hydration; however, we still employ this agent because of the occasional dramatic improvement that does occur.

We have consistently demonstrated arterial blood pO_2 values much less than would be theoretically expected. This A-a gradient often persists and frequently worsens despite correction of ventilatory deficiencies by tracheostomy and mechanical respiratory assistance. Pulmonary function studies carried out in a small group of these patients have demonstrated increased shunting and increased physiologic dead space.

Initial treatment is directed toward insuring an adequate airway, free of secretion. Nasal oxygen

is administered routinely. If ventilation is clinically inadequate or if a pO_2 of less than 60 mm Hg is present, an endotracheal tube is passed and respiration is mechanically assisted. Tracheostomy in the hypoxic patient is hazardous and is more safely and easily performed with an endotracheal tube in place. In addition to the increased ventilation produced by the mechanical respirator, the work of breathing is greatly reduced. The latter is an important therapeutic factor in these seriously ill patients.

Myocardial failure may be the cause (primary myocardial failure) or the effect (secondary myocardial failure) of shock. Primary myocardial failure most commonly results from coronary occlusion and myocardial infarction. The initial muscle injury results in decreased cardiac output and causes a lowering of blood pressure. This decrease in cardiac output and blood pressure decreases coronary flow, which results in further injury to the myocardium. Vasopressors in these patients may reverse the process by increasing peripheral resistance and arterial blood pressure. Coronary blood flow is increased and the better nourished myocardium then may compensate for its injury. A similar viscous cycle may be present in the hypotensive patient without infarction. Decreased cardiac output and blood pressure result in diminished coronary blood flow which injures the myocardium and produces a decrease in myocardial contractile force. Diminished myocardial contractile force lowers the cardiac output and the blood pressure even further.[9]

Our approach to the problem of secondary myocardial failure in shock is based on the correction of the presenting pathophysiology. Initial efforts are directed toward the correction of volume deficits and acid-base and electrolyte imbalances. Frequently, correction of these abnormalities re-establishes adequate blood pressure and cardiac output, and subsequently coronary artery blood flow is increased. The viscous cycle is broken and the heart rapidly recovers from the insult. If the central venous pressure increases abnormally during the above therapy, digitalis in the form of Digoxin is administered intravenously. If the patient remains hypotensive and the central venous pressure continues to rise, circulatory support by adrenergic stimulating drugs is indicated. At present, it is generally agreed that two types of adrenergic receptors exist in the human circulatory system.[10] Alpha receptors produce peripheral arteriolar constriction, but have no direct effect on the myocardium. Since vasoconstriction and decreased tissue perfusion are two of the pathophysiologic abnormalities in shock, alpha adrenergic stimulating drugs appear to be contraindicated. Beta adrenergic stimulating drugs, producing both increased myocardial contractile force and arteriolar dilatation, theoretically should be ideal. At present, we utilize the beta stimulating drug isoproterenol, administered by intravenous drip (200 mcg/200 cc 5% D/W).

The blood pressure and cardiac output are brought to adequate levels and maintained by regulating the rate of infusion. Often, central venous pressure will decrease and urinary output will increase within a few minutes after the onset of the isoproterenol infusion. This allows the resumption of volume therapy if indicated: The infusion of fluid can be regulated by the central venous and arterial pressure response. Hopefully, adequate perfusion will break the viscous cycle of organ degeneration and allow gradual discontinuance of the isoproterenol.

A CLINICAL SHOCK TRAUMA UNIT LOOKS AT FUTURE THERAPY FOR PATIENTS IN SHOCK

ELWOOD H. LaBROSSE, MD, PhD
Resident Associate Professor, Department of Surgery
Assistant Professor, Department of Biochemistry
University of Maryland School of Medicine

Shock therapy today consists of fluid replacement to provide an adequate circulating blood volume, correction of electrolyte and acid base disturbances, assisting the failing heart, providing adequate respiratory exchange, and treating the initiating factor. These measures have been effective in resuscitating many patients in severe shock. In spite of the vigorous application of these methods, some patients do not respond to the treatment even when therapy has been promptly and adequately administered. It is these refractory patients that our CSTU is now studying from the biochemical and metabolic points of view. It is anticipated that information from these studies will permit us to establish guidelines for selection of therapy in the future.

Present information suggests that, in patients who do not respond to the currently established methods of treatment, there is a failure at the tissue level to utilize oxygen, even though the circulating blood volume has been restored, there is an adequate respiratory exchange in the lungs and there is an adequate cardiac output. As demonstrated in our laboratory,[1, 2] as well as in other laboratories,[3] evidence of a failure of utilization of oxygen at the tissue level is the fact that these patients show a continuing increase in blood lactate and pyruvate, which indicates that the tissues are metabolizing anerobically even though the oxygen supply has been raised to or toward the normal levels. This failure of oxygen utilization at the tissue level indicates that there is a breakdown in the intracellular transport and in utilization of oxygen at its reaction sites. These sites, where most of the oxygen reacts to provide energy for cellular function and reparation of injury, are located in the mitochrondria. Within these highly organized bundles of enzymes, oxygen is combined with carbon to form carbon dioxide, and with hydrogen to form water, by a series of step-wise and cyclic reactions known as glycolysis and the citric acid cycle,[4] and these are the reactions that produce energy and thus enable the cells to accomplish their many functions.

On the basis of this information, and stimulated by the successful results of treatment of carbon tetrachloride poisoning in rats by the administration of mitochondria, which has been reported by some German investigators,[5] Dr. Sadayoshi Hashimoto, working in our laboratories, has isolated and administered mitochrondria to dogs suffering from hemorrhagic shock.[6] The experimental hemorrhagic shock to which these dogs were subjected was a modification of the standardized procedure that has been described by Dr. Jacob Fine.[7] Under these experimental conditions, hemorrhagic shock is produced by withdrawing blood from the dogs into a reservoir until the blood pressure falls to 30 mm Hg and the blood pressure is kept at this level by additional withdrawal or retransfusion of the blood as necessary. When this period of hypotension has been maintained for a period of 2½ hours, the animals are then reinfused with their blood from the reservoir.

The method for the production of the experimental shock was the same in each of four groups. Group I, the control group (30 dogs), was untreated and had a survival rate of 17%. Group II ((22 dogs) was given a suspension of dog liver mitochondria (150 mg protein/100 ml of saline and 10 ml were given per kg body weight). The administration of the mitochondrial preparation, in this and each of the following groups, was started 30 minutes after the blood pressure

From the Clinical Shock Trauma Unit, University of Maryland School of Medicine, Baltimore, Md. Supported by the US Army Medical Research and Development Command, Department of the Army, under Research Contract No. DA-49-193-MD-2229.

reached 30 mm Hg and continued until the indicated dose, 10 ml/kg body weight, was completed. In Group II the survival rate was 59%. Because of the limited amount of dog liver which is available for preparation of mitochondria, Dr. Hashimoto next prepared the mitochondria from beef liver and lyophilized them to preserve their enzymatic activity. This preparation of lyophilized beef liver mitochondria was given to the animals (20 dogs) of Group III, at the same concentration as in Group II, and the survival rate was 80%. In order to obtain a more highly purified preparation (ie, one with a lower protein content), Dr. Hashimoto went to beef heart and fractionated the beef heart mitochondria into electron transport particles. Group IV (14 dogs) was given a saline suspension of the beef heart electron transport particles containing only 20 mg of protein/100 ml of saline, but the survival rate was highest, 86%, in this group.[6] The results of these investigations indicated that the administration of mitochondrial preparations had a highly significant effect on increasing the survival of dogs in experimental hemorrhagic shock.

In addition to these studies on dogs, rats—in experimentally induced hemorrhagic shock—have been treated with electron transport particles, and again in these animals a significant improvement in survival was observed. These results, therefore, suggest that treatment with mitochondria, or mitochondrial fractions, significantly increased the survival rate of animals that were subjected to experimental hemorrhagic shock. The exact mechanism of the action of mitochondrial fractions is not known, but in the group of animals given the smallest amounts of protein, namely the group of dogs treated with the beef heart electron transport particles, the amount of protein which was administered was less than 1/7 of that administered to the dogs which received dog liver mitochondria or lyophilized beef liver mitochondria, and yet the survival rate was comparable to that in the other group. This suggests that it was not the oncotic effect of these compounds which was of primary importance in survival, but the enzymatic activity of the fractions. An additional study was carried out by treating the electron transport particles with an enzyme inhibitor, rotenone. The particles treated with this compound no longer exhibit diphosphopyridine nucleotide dehydrogenase activity and yet their oncotic effect was unchanged. Rats which were subjected to hemorrhagic shock and were then injected with rotenone-treated electron transport particles had a survival rate not unlike the control group that received saline only. By contrast, there was a significant increase in the survival rate in animals which were given uninhibited electron transport particles.[8] This evidence suggests it is the enzymatic activity in the electron transport particles that is important for their effect on survival in shock. Further studies are necessary to clarify the mechanism by which these preparations increase the survival rate in the animals subjected to experimental shock.

Continuing studies in our laboratories further emphasize the importance of changes at the mitochondria level. Dr. Setsu Komatsu has investigated the oxygen uptake of mitochondria isolated from rats which have been subjected to experimental traumatic shock using the Noble-Collip drum.[9] These studies have revealed that mitochondria isolated from rats which have been subjected to traumatic shock have a significantly different response, namely in the respiratory control ratio, from mitochondria which are isolated from rats which have not been subjected to shock. This indicates that there is a difference at the mitochondrial level in animals which have been subjected to severe shock. Dr. Hirotoshi Shimizu, in our laboratories, has confirmed and extended the studies of Dr. Komatsu. Further work is in progress to define more completely the exact nature of these changes in the mitochondria.

The results of our studies up to the present time indicate that there is a significant change in the important intracellular organelles, mitochondria, as a result of shock, and that the treatment of animals which have been subjected to shock has shown an increase in survival when mitochondria, or mitochondrial fractions, have been administered. The use of these substances is aimed primarily at increasing the tissue utilization of oxygen by making the cells able to work more nearly at their normal efficiency. Additional investigation will be required to elucidate the mechanism of their therapeutic action.

A further approach to the therapy of shock is that of increasing the oxygen tensions at the cellular level, therefore forcing more oxygen into

the cells to bring its rate of utilization up to the normal levels.[10] This general approach has been made possible by the development of methods for administering oxygen at increased concentration and at increased pressure by a technique known as hyperbaric oxygenation, and is creating a new field of hyperbaric medicine. The technique of administering oxygen in a closed system at greater than atmospheric pressure makes it possible to increase the amount of oxygen dissolved in the plasma that can be carried to the cells even when there is a decrease in the amount of circulating red blood corpuscles. Under these conditions the oxygen tensions at the cellular level can be greatly increased. This method has the potentiality of "forcing" the oxygen into the cells at a higher rate, and for this reason it may promote oxygenation within the hypoxic cells even when the circulating blood volume is decreased. When the cellular utilization is decreased, this technique might prevent injury to the mitochondria. We believe that hyperbaric oxygenation has considerable potentiality for the treatment of shock.[7] As indicated above, however, the toxic reactions to 100% oxygen at pressures greater than one atmosphere make further detailed studies necessary. Numerous aspects of the application of hyperbaric oxygen to the treatment of pathological conditions have recently been described.[10]

The administration of mitochondrial preparations and other substances with enzymatic activity offers a potential method for increasing oxygen utilization and energy production. The modality of hyperbaric oxygen offers a means of increasing the oxygen supply at the intracellular level even under conditions of diminished transport. These are two promising methods which may be used for the future treatment of patients in shock, especially in the treatment of the patients who have previously been described as "refractory" because of their lack of response to the methods of treatment that are currently effective in the majority of cases.

PROGRESS AGAINST CANCER

The National Advisory Cancer Council reported that, although cancer is still on the increase, more people are being cured of it than ever before.

Entitled "Progress against Cancer," the report shows that 30 years ago there were 144,774 cancer deaths in the United States, a crude rate of 112.4 per 100,000 of the population. In 1967, an estimated 305,000 deaths will occur, bringing the rate up to 153 per 100,000, according to the report. On the other hand, there has been an improvement in the cure rate. In 1937, less than one in five cancer patients survived five years without evidence of disease, but currently about 35 per cent, or better than one in three are saved. There is good reason to believe, the report states, that this favorable trend will continue.

From an AMA news release, Jan, 1967.

THE Regent

Nursing & Rehabilitative Treatment Center

Offering full treatment to the adult physically handicapped, specialized care to the senior citizen, and convalescent care to post-stroke and post-operative cases. Separate area for cancer patients. *All facilities available to private physician.*

Professionally staffed and equipped Physical Therapy gymnasium, under the direct supervision of a specialist in physical medicine. There is also an organized program of recreation.

Everything at The Regent is designed to be used by wheel chair patients.

Adjacent to the Penn-Mar Shopping Center on Marlboro Pike Beltway Exit 34

TRANQUILIZER IMPACT ON PSYCHIATRIC TREATMENT

Of the host of drugs used in psychiatry today, the major tranquilizers are clearly the best, according to Jonathan O. Cole, MD, of the National Institute of Mental Health, US Public Health Service.

Studies directed by the Institute show that two-thirds of newly-admitted schizophrenic patients improve markedly in six weeks on these drugs, known as phenothiazines, Dr. Cole said. They have sped the release of patients from hospitals at a saving of some $2 billion in hospital costs alone. Losses in patient earning power would raise the figure much higher, he declared. These drugs can cause mildly uncomfortable side effects, but they are usually tolerable. They have facilitated new patterns of treatment, such as day care clinics and community centers, and have prevented altogether the hospitalization of many patients, he added.

Dr. Cole, an international authority on drugs, spoke on February 20 at the Lowell Lecture Series sponsored by the Tufts University School of Medicine in Boston. He heads the Psychopharmacology Research Branch, NIMH, the Federal unit which supports research on drugs that act on the mind.

The value of other drugs in general usage for emotional disorders range from moderately effective to almost useless, according to Dr. Cole.

From NIMH news release, Feb 21, 1967.

New from Du Pont

Symmetrel®

(Amantadine HCl)

The first oral chemical virostat for the prevention of influenza A_2

Influenza virus
Protein shell enclosing the core of nucleic acid (RNA)—artist's representation

The incidence of influenza A_2. In this country, where influenza is one of the leading causes of morbidity, influenza A_2 (Asian) continues to be a serious medical problem. In 1957 influenza A_2 was responsible for approximately 40,000 excess deaths in a three-month period. Since that year the most prevalent influenza virus has been A_2 (Asian).

What is Symmetrel®? "Symmetrel" (amantadine HCl) is a new synthetic chemical which acts as a molecular barrier to virus penetration. It provides for the first time specific oral medication for the prevention of respiratory infections caused by influenza A_2 (Asian) viruses—an entirely new approach in preventive medicine.

For prescribing information, see last page of this presentation

What Symmetrel® (amantadine HCl) means to you

...the first and only oral chemical agent to prevent influenza A_2 (Asian).

...not a vaccine or antibiotic, but a new synthetic chemical unrelated to any other chemotherapeutic agent.

...unique mode of action: prevents virus penetration of the host cell without affecting vital cell functions.

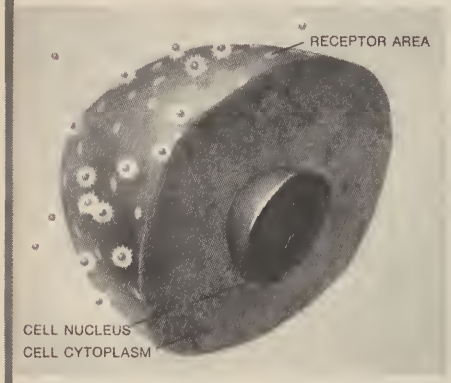
...specifically active against all influenza A_2 viruses tested to date.

...not indicated for the prevention of influenzal or respiratory illness other than influenza A_2 or for the treatment of established disease.

...does not interfere with normal antibody response; acts in concert with pre-existing antibody.

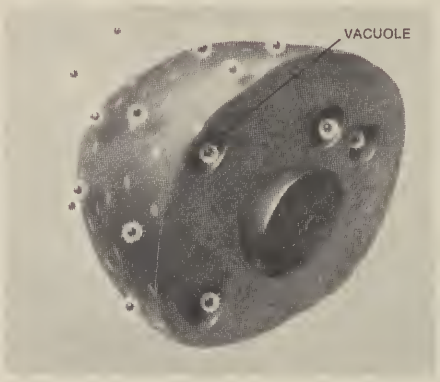
What Symmetrel® means to your patient

...possible immediate influenza A_2 protection when taken following suspected contact.



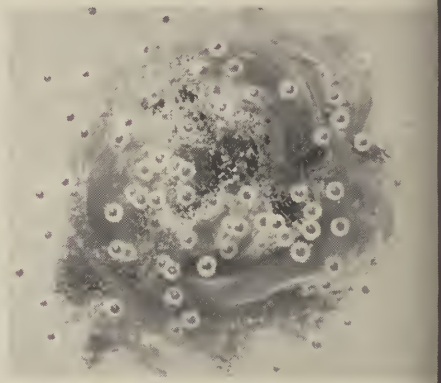
...may be particularly useful during outbreaks or epidemics and for high-risk patients in whom the occurrence of influenza A_2 is especially hazardous.

...a high degree of safety in clinical use.



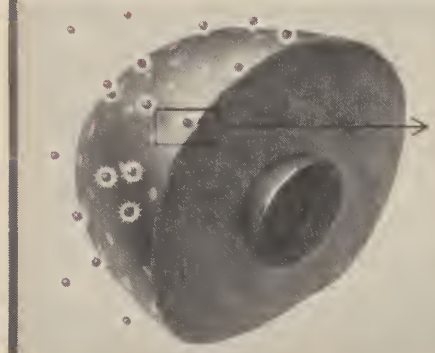
...simple once daily or b.i.d. dosage.

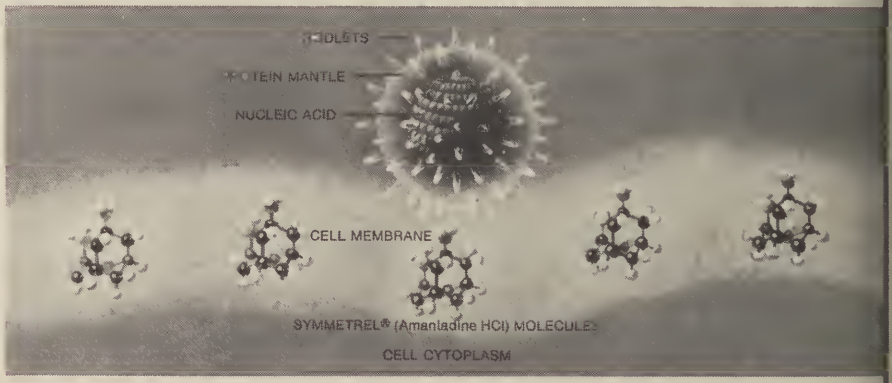
The mode of action of Symmetrel®



How the influenza virus invades and destroys the untreated cell

1 Viruses outside the cell attach themselves to specific cell receptor areas





2 The virus is incorporated into a vacuole within the cell. From this vacuole the virus nucleic acid passes into the cell cytoplasm

3 The virus nucleic acid then directs the cell to produce both new virus nucleic acid and virus protein coat material which aggregate to form new virus particles. This process leads to the release of new virus particles and eventual destruction of the cell

How Symmetrel® (Amantadine HCl) prevents virus invasion[1]

Our current knowledge leads us to believe "Symmetrel" acts as a molecular barrier to influenza virus penetration. Shown here in a greatly enlarged section, "Symmetrel"—located at the cellular membrane—effectively prevents (blocks) virus penetration. Thus, "Symmetrel" does not directly destroy the virus particle but acting as a virostat prevents the cycle of virus penetration, virus replication, and cell destruction that is characteristic of virus invasion of animal cells (tissue). *Artist's conception based on current scientific knowledge.*

1. "Mode of Action of the Antiviral Activity of Amantadine in Tissue Culture", Hoffmann, C. E.; Neumayer, E. M.; Haff, R. F.; and Goldsby, R. A., Journal of Bacteriology *90*,623 (1965).

Safety of Symmetrel® Confirmed. When used as indicated, is generally well tolerated. No kidney, liver, bone marrow, or hematological disturbances have been observed.

Prescribing Information

Indications: "Symmetrel" is indicated for the prevention (prophylaxis) of influenza A_2 in persons of all age groups. Early use is recommended, preferably before or as soon as possible after actual or suspected contact with individuals suffering from influenza A_2. "Symmetrel" should especially be considered for high influenza-risk patient groups such as those suffering from chronic debilitating diseases and elderly persons.

Contraindications: Not indicated for the prevention of influenzal or respiratory illness other than influenza A_2 or for the treatment of established disease.

Warnings: Administration to patients with central nervous system disease, particularly geriatric patients with cerebral arteriosclerosis, and patients with a history of epilepsy or other "seizures," requires strict observation for possible untoward effects (see Adverse Reactions). Patients taking psychopharmacologic drugs, central nervous system stimulants, or alcoholic beverages should be observed for possible evidence of intolerance. Those patients who experience central nervous system effects or blurring of vision should be cautioned against driving or working in situations where alertness is important.

No teratogenic effects have been seen in reproductive studies in rats and rabbits. Studies in pregnant women have, however, not been done and use of this drug in women of childbearing age should be undertaken only after weighing the possible risks to the fetus against benefit to the pregnant patient. It should not be administered to nursing mothers since it is not known whether the drug is secreted in the milk.

Precautions: Ineffective against bacterial infections. Patients should be observed for idiosyncratic reactions as with all new drugs. Geriatric patients with pre-existing serious medical illnesses with mental or physical deterioration should be followed carefully medically while taking "Symmetrel." (See Adverse Reactions.)

Adverse Reactions: With higher than indicated doses manifestations of central nervous system effects such as nervousness, insomnia, dizziness, lightheadedness, drunken feeling, slurred speech, ataxia, inability to concentrate and some psychic reactions including depression and feelings of detachment were seen. Occasional blurred vision was reported at higher doses. Some of the milder and less pronounced symptoms above have been reported in a small number of patients taking the recommended dosage of 200 mg per day. Those were mostly transient and disappeared with continued administration of the drug. Some geriatric patients developed paranoid or hallucinatory behavior and became unmanageable while taking 200 mg daily. Medically unselected seriously deteriorated geriatric patients showed poor clinical tolerance after several weeks of daily dosing with 200 mg per day. One elderly patient with a history of prior cerebrovascular accident developed visual hallucinations and grand-mal convulsions while on drug at 800 mg per day. Some cases of dry mouth, gastrointestinal upset and skin rash and rarely, tremors, anorexia, pollakiuria, and nocturia have been also reported.

Safety: When used as indicated, is generally well tolerated. No kidney, liver, bone marrow, or hematological disturbances have been observed.

Dosage: *Adults:* Two 100 mg capsules (or 4 teaspoonfuls of syrup) as a single daily dose or the daily dose may be divided into one capsule of 100 mg (or 2 teaspoonfuls of syrup) twice a day.

Children: 1 yr.—9 yrs. of age: Calculate total daily dose on the basis of 2 mg to 4 mg per pound of body weight per day (but not to exceed 150 mg per day). Daily dose, given as the syrup, should be given in 2 or 3 equal portions.

9 yrs.—12 yrs. of age: Total daily dose 200 mg given as one capsule of 100 mg (or 2 teaspoonfuls of syrup) twice a day.

How Supplied: *Capsules:* Bottles of 100. Each red, gelatin capsule contains 100 mg amantadine HCl.
Syrup: Bottles of 1 pint. Each 5 ml (1 teaspoonful) contains 50 mg amantadine HCl.

DUPONT

Symmetrel®

(Amantadine HCl)

A molecular barrier to virus penetration

NEW EVIDENCE:

Pro-Banthīne® (propantheline bromide)
gives positive, selective benefits in gastrointestinal disorders.

Intragastric photograph of pyloric region showing complete relaxation of pyloric sphincter with 6 mg. of Pro-Banthine intravenously.

AN IMPORTANT PROBLEM in managing gastrointestinal disorders has been the choice of an anticholinergic agent which will act positively and selectively on the gastrointestinal tract without extensive secondary effects.

Recent direct observations with the cinefibergastroscope and intragastric photography[1] visually confirm previous evidence that Pro-Banthine does, indeed, possess such selective activity.

Barowsky and his associates demonstrated that a minimal dose of 6 to 8 mg. of Pro-Banthine intravenously produced complete relaxation of gastric activity. Secondary effects were not significant.

By contrast, it required 0.8 mg. or double the usual dose of atropine intravenously to achieve similar gastric relaxation. Side effects of this dosage of the belladonna alkaloid were pronounced. Ventricular rates were as high as 150 per minute.

For positive, selective anticholinergic benefits Pro-Banthine is indicated in patients with peptic ulcer, gastritis, irritable colon and other forms of gastrointestinal hypermotility.

Dosage: The maximal tolerated dosage is usually the most effective. For most *adult* patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two tablets four to six times daily may be required. Pro-Banthine (brand of propantheline bromide) is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type ampuls of 30 mg. The parenteral dose should be adjusted to the patient's requirement and may be up to 30 mg. or more every six hours, intramuscularly or intravenously.

Contraindications: In glaucoma or severe cardiac disease.

Precautions: Since varying degrees of urinary hesitancy may occur in the elderly male with prostatic hypertrophy, this should be watched for in such patients until they have gained some experience with the drug.

Although never reported, theoretically a curare-like action may occur with possible loss of voluntary muscle control. Such patients should receive prompt and continuing artificial respiration until the drug effect has been exhausted.

Side Effects The more common side effects, in order of incidence, are xerostomia, mydriasis, hesitancy of urination and gastric fullness.

1. Barowsky, H.; Greene, L.; Bennett, R., and Buganza, G.: The Effect of Anticholinergic Drugs on Gastric Motility and Pyloric Function, Scientific Exhibit, Annual Convention of the American Medical Association, Chicago, Illinois, June 26-30, 1966.

SEARLE *Research in the Service of Medicine*

When the battle with bacteria is in the upper respiratory tract

Routes of invasion through the oral and nasal passages to the nasopharyngeal mucosa: artist's depiction of sagittal section of head in perspective.

consider Gantanol (sulfamethoxazole)

To rapidly help the patient win against upper respiratory infections

When the respiratory tract has been invaded, an antibacterial that can assure effective yet generally uncomplicated therapy is your first line of defense...an agent such as Gantanol (sulfamethoxazole), the wide-spectrum antibacterial from Roche.

Gantanol (sulfamethoxazole) is effective against common susceptible upper respiratory pathogens, both gram-positive and gram-negative. Acting at foci of bacterial invasion, Gantanol (sulfamethoxazole) promptly helps control most infections, yet usually presents few problems to patients. Dosage is convenient and provides a measure of economy.

Before prescribing, please consult complete product information, a summary of which follows:

Contraindicated in sulfonamide-sensitive patients, pregnant females at term, premature infants, or newborn infants during first three months of life.

Warnings: Use only after critical appraisal in patients with liver damage, renal damage, urinary obstruction or blood dyscrasias. If toxic or hypersensitivity reactions or blood dyscrasias occur, discontinue therapy. In intermittent or prolonged therapy, blood counts and liver and kidney function tests should be performed.

Precautions: Observe usual sulfonamide therapy precautions, including maintenance of an adequate fluid intake. Use with caution in patients with histories of allergies and/or asthma. Patients with impaired renal function should be followed closely since renal impairment may cause excessive drug accumulation. Occasional failures may occur due to resistant microorganisms. Not effective in virus or rickettsial infections.

Adverse reactions: Headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, Stevens-Johnson syndrome, injection of the conjunctiva and sclera, petechiae, purpura, hematuria or crystalluria may occur, in which case the dosage should be decreased or the drug withdrawn.

Dosage: Adults—4 tablets initially, then 2 tablets b.i.d. or t.i.d. depending upon severity of infection. Children—1 tablet/20 lbs initially, followed by ½ tablet/20 lbs b.i.d.

How supplied: Tablets, 0.5 Gm, bottles of 50.

PRESIDENT'S MESSAGE ON CHILDREN AND YOUTH

On February 10, the President submitted his special message to the Congress on children and youth. Among other things, he recommended an increase in appropriations of $100 million to provide medical care for needy children under the Title XIX program. He also requested full authorization of $40 million for the comprehensive health service program for preschool and school children.

The President said, "There are only 12,000 trained pediatricians and 13,000 obstetricians in the United States today—far too few to provide adequate medical care for all our children and mothers."

The President also recommended legislation to authorize 10 pilot centers in 1967 to provide research and development for child health care and to provide care for 180,000 needy children and 10,000 mothers. The new centers will be associated, whenever possible, with medical universities or neighborhood health centers. He advised that he is directing the Secretary of Health, Education, and Welfare to allocate increased funds to help train pediatricians, obstetricians, and family doctors with respect to mental retardation, as well as seeking federal support for the staffing of community mental health centers.

From a news release of the AMA Council On Legislative Activities, Feb 10, 1967.

MEDIC: A COOPERATIVE VENTURE IN CONTINUING MEDICAL EDUCATION

F. J. HELDRICH, JR., MD
Chairman, Subcommittee on Continuing Education Medical and Chirurgical Faculty of the State of Maryland

Director, Continuing Medical Education Maryland State Department of Health

In October 1965, a chain of communication was formed among several of the community hospitals of the State of Maryland for the purpose of disseminating programs of medical interest among Maryland physicians. This represented an attempt to circumvent two major obstacles that minimize the effectiveness of many programs of continuing medical education: time and distance. These two factors had been repeatedly referred to during discussions with interested physicians in the community hospitals of the State, and their opinions had been corroborated by those of the Medical Education Committee of the Hospital Council of Maryland. Since the obstacles of time and distance confront both the medical educator and the practicing physician, it was agreed that they deserved primary consideration in any attempt to improve the effectiveness of the processes of continuing medical education.

Philosophy: From the beginning it was recognized that the matter of continuing medical education for the physician is basically a personal one and that each physician will meet his needs in the manner he deems most appropriate. Through lectures, case presentations, courses and seminars, attendance at society and professional meetings, reading, "curbstone consultations" with his peers, referral letters, films, records, television tapes, and correspondence courses, the physician is continually striving to meet this need. All of these methods have merit. Depending on the personal judgment of each physician, some have greater appeal than others.

While not attempting to detract from any of these methods nor to imply that there is necessarily a best way to accomplish this end, many felt that scheduled programs on a recurring basis, offered in the community hospitals in which the physicians work, might be a worthwhile addition to post-graduate medical education. The sharing of medical programs given in one hospital with physicians throughout the State held promise of several unique benefits: hospitals with limited resources for developing programs of medical education would be assisted, the number of educational opportunities available to all would be increased, and the medical education thus provided would become part of the working day rather than make further inroads on what little free time is available to physicians. These concepts seemed worth testing.

General hospitals were chosen as the focal points for programs of continuing medical education because all physicians in the State have ready access to at least one of them. Following the overall pattern of population density, 44 such hospitals are distributed throughout Maryland. Few of the State's physicians live more than 30 miles from a general hospital and most live much closer. A high percentage of the physicians in the State are affiliated with one of these community hospitals and usually go there during the

course of a day. Travel time and distance were thus seen to be reducible to a minimum through the use of these locations.

To accommodate the physician further, we remained cognizant of his heavy workload. It is not realistic to expect any physician to cancel out large segments of time ordinarily devoted to patient care, nor would it be fair to the patients. It would only add to medicine's present manpower shortage. We therefore felt we should strive to present programs of *general* medical interest during the times when the largest numbers of physicians are able to attend, programs of *special* medical interest at times when those most interested in these specialty programs are free, local programs dictated by the preferences of local physicians, etc. At best, his attendance entails an appreciable sacrifice on the part of the physician. To lose sight of time and timing would have been a grievous error.

Sharing of programs among the physicians of the community hospitals seemed especially appealing to the smaller hospitals and to those farthest removed from the teaching centers. Certainly, some of the community hospitals have excellent intramural programs of continuing medical education, but the benefits from their programs are limited to the physicians who attend at those locations. Almost everyone agrees that personal attendance is preferred, but not really possible except for those in immediate proximity to the point of program presentation. A means of bringing these programs to physicians in their own hospital setting was therefore a basic objective.

Method: Exploring the means of accomplishing this led to an investigation of several media. It was initially agreed that we in Maryland desire privacy and feel that it should not be compromised. There was one other limitation—the cost had to be borne by the physicians themselves. With these limitations in mind, the possible means of accomplishing our aims were investigated.

Inquiry concerning television soon established

Fig 1

Physicians in local hospital receiving a MEDIC broadcast. Note the slide projector used for slide presentation and next to it the telephone by which the physicians at this hospital may speak over the network. The voice of the lecturer is coming through the small speaker located just below and to the right of the screen.

the fact that no facilities—other than public television channels—were available in the State. For us, a statewide educational television network that might be adapted to our needs was still in the drawing board stage. Radio was available—FM radio—but investigation of cost revealed it to be financially prohibitive on a cost-per-hours-used basis.

Further investigation revealed that Dr. John Tuohy, at Saint Agnes Hospital in Baltimore, was employing a suitable method—the telephone. Accordingly, MEDIC (Medical Education's Dedicated Instructional Channel) was established. By means of this telephone linkage among the community hospitals of the State, the spoken word is transmitted simultaneously to all participating hospitals. A suitable loud-speaker, the size of which depends upon the size of the conference area used, is placed in each hospital. All programs are heard over these speakers, which are nothing more than magnified telephone ear pieces. Not only can physicians listen over this network, but they can also reply and/or ask questions and, in effect, carry on conversation among themselves. To talk over the network, the speaker uses either a telephone handset or a microphone (depending, again, upon the size of the room in which the equipment is located). To supplement this voice transmission, slides and other pertinent material are duplicated and distributed to all of the participating hospitals before the presentation. These are then used in each location during the program. As the talk progresses, the slides are projected on the screen at each community hospital in response to the lecturer's request. Perhaps the end result may best be dubbed "horse and buggy television." A typical local audience receiving a MEDIC program is pictured in Fig 1.

Financing: Funds to make this system operative come from three basic sources. In each of the participating hospitals, the hospital administration usually assumes the rental cost of the equipment necessary to establish the network. The Maryland State Health Department pays for administrative costs and the costs of preparing and distributing visual aid material. The physicians of the State of Maryland, through their parent organization, the Medical and Chirurgical Faculty, pay the cost of rental of the telephone lines establishing the links among the participating hospitals. In addition, the administrative staff of the Medical and Chirurgical Faculty acts as treasurer for the network and supplies a good deal of secretarial support.

An added feature aimed at conserving the physician's time is supplied by the administrative staff of many of the participating hospitals with the serving of lunch.

Administration: Control of the MEDIC network is the responsibility of the MEDIC Subcommittee whose parent committee is the Committee on Postgraduate Education, Preventive Medicine, and Public Health of the Medical and Chirurgical Faculty. Membership of the MEDIC Subcommittee is composed of physician representatives from each of the participating hospitals. In addition to serving on this subcommittee, these physicians handle all of the work that MEDIC creates in their hospitals. Enough cannot be said of the importance of their contributions. An advisory committee to the MEDIC Subcommittee, made up of representatives from the Medical and Chirurgical Faculty, the two Baltimore medical schools, physician representatives of the Hospital Council of Maryland and of the State Health Department, also functions. It should be noted that control of this network is, as was originally intended, in the hands of the physicians of the State of Maryland. Schematic portrayal of the administrative structure is shown in Fig 2.

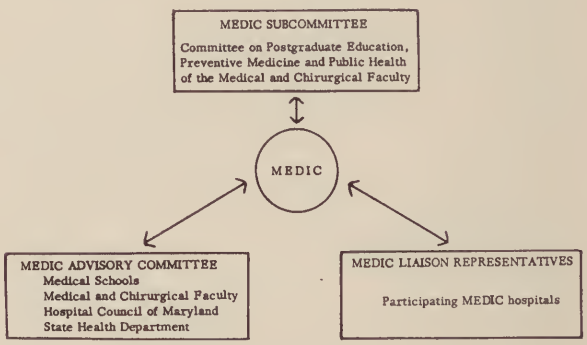

Fig 2

From the membership of the MEDIC Subcommittee, three adjunct committees have been formed: one to deal with program planning for practicing physicians; another to deal with program planning for House Officers; and yet a third to explore the varied, potential uses of the MEDIC network. Through the membership of this MEDIC Subcommittee and its various ad-

junct committees, the major part of the work involved in sustaining our educational efforts through MEDIC is being accomplished.

Programs: A week's program schedule over MEDIC is shown in Fig 3.* Up to this time, with the notable exception of the series of lectures originating from the Frederick Memorial Hospital, there has been very little master planning of program content. For the most part, the topics chosen for discussion in the Friday Lecture Series are those which seem to offer the widest interest for the medical profession. On the other hand, the series of lectures that originate on a monthly basis from the Frederick Memorial Hospital has greater direction. The entire series has a general theme. By way of example, this year it is endocrinology. Various aspects of endocrinology are explored by authorities in the field at each monthly lecture, each adding depth to the general theme.

MEDIC SCHEDULE

February 20 - 25, 1967

21st TUESDAY 11:30 - 1:00 PM - Originating from UNIVERSITY HOSPITAL
MEDICAL GRAND ROUNDS

24th FRIDAY 1:00 - 2:00 PM - Originating from FREDERICK MEMORIAL HOSPITAL
PINEAL GLAND
Dr. Richard Wurtman
National Institutes of Health

2:00 - 3:00 PM - Originating from UNIVERSITY HOSPITAL
NEUROLOGY ROUNDS

25th SATURDAY 8:00 - 9:30 AM - Originating from THE JOHNS HOPKINS HOSPITAL
PEDIATRIC GRAND ROUNDS

10:00 - 11:30 AM - Originating from THE JOHNS HOPKINS HOSPITAL
MEDICAL GRAND ROUNDS

Fig 3

Of course, little can be done about material utilized in Grand Rounds presentations. These sessions employ the use of clinical material, currently in the respective hospitals, which has appeal as "a good teaching case." In the future, with the collaboration of the two adjunct committees on program planning, it is expected that greater care will prevail in the selection of material to be used. It will be worthwhile to explore various types of programs and not to depend on the time-honored medical lecture to the exclusion of other forms of presentation. Certainly, CPCs, panel discussion, and case presentations all deserve consideration in future program planning.

Scheduling completed for the year 1967-1968 indicates that almost all of the Friday noon programs will originate from one of the community hospitals—not the medical schools. Behind this approach is the desire to stimulate active programs of continuing medical education in each hospital and to involve the local physicians in their preparation and presentation. Both the University of Maryland School of Medicine and The Johns Hopkins University School of Medicine have given their support to this concept and indicated willingness to have faculty members from each institution participate on invitation. In addition, the schools will continue to offer their Grand Rounds presentations as in the past. Thus, we will be presenting Medical and Neurology Grand Rounds from the University Hospital, and Medical and Pediatric Grand Rounds from The Johns Hopkins Hospital.

Evaluation: Evaluating the effectiveness of all efforts in continuing medical education is extremely difficult, and, at this point, no good means exists for accurate appraisal. MEDIC programs are no exception. At present, our modest attempts along these lines simply employ a tabulation of physicians attending and, hopefully, their pertinent comments and criticisms. The hospitals are supplied with evaluation sheets to be filled out for each program. A compilation of all individual reports is sent to each participating hospital. Unfortunately, however, the return of evaluation sheets for compilation has been less than 100% and the accuracy of our figures is therefore subject to question.

Timing: In addition to program content, one of the special problems to date has been the time at which the lecture programs are given. The noon hour was initially selected because this time seemed best for the majority of the physicians. However, it certainly is not optimal for all. Realization of the possible desirability of changing the time of the MEDIC lecture presentation exists; however, no time more suitable for the majority has been found. Appropriate changes should be made on the basis of experience and the will of the majority of the physicians involved. There is much that can be said for establishing a routine. In the year to come, MEDIC lectures will there-

**MEDIC programs are listed each month in* THE JOURNAL. *For those to be presented in the immediate future, see page 11.* ED.

Participating MEDIC Locations

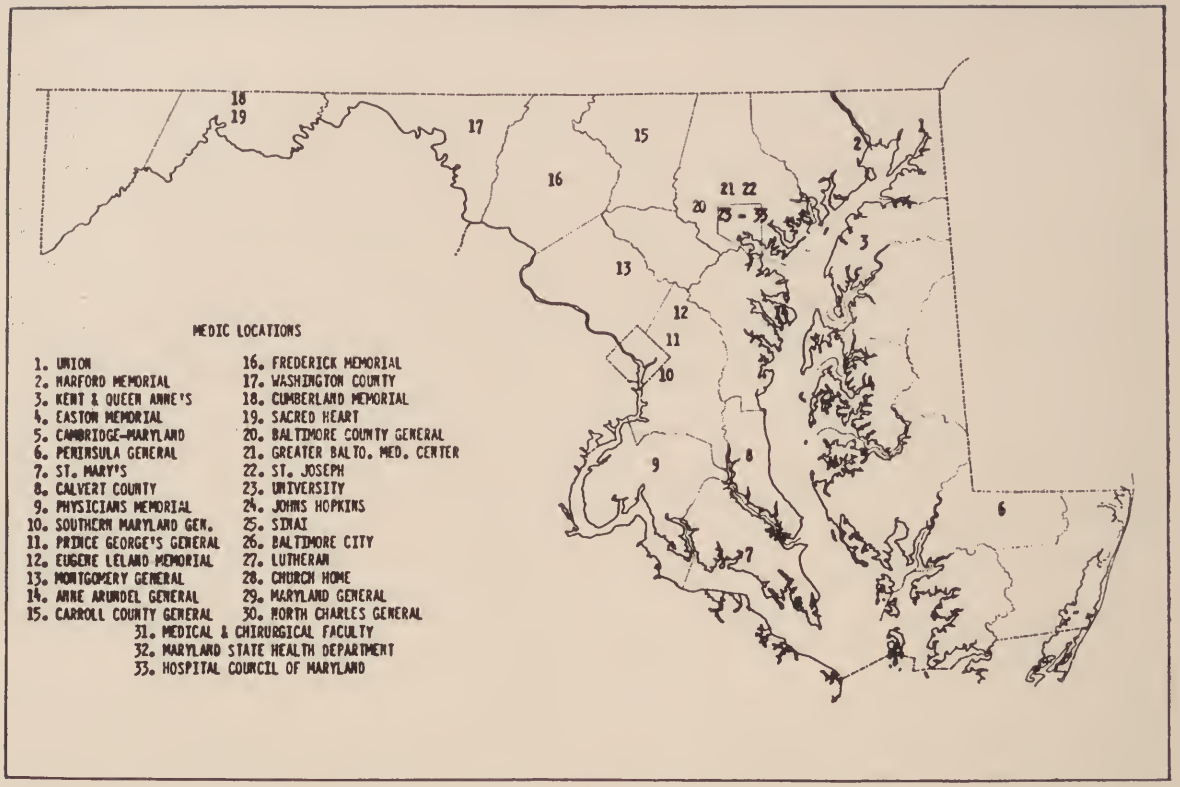

Fig 4

fore continue to be scheduled for noon on Fridays. Knowing the MEDIC schedule a year in advance may enable some physicians to adjust their own schedules accordingly.

For physicians who are unable to fit the MEDIC lecture into their Friday calendars, it was suggested that programs be taped in each participating hospital. These tapes, along with the slide material, may then be kept in the hospital for future reference by interested physicians at their leisure. The extent to which this is being carried out is unknown to us, but there is available, on loan from the Maryland State Health Department, a master tape and slide set for each of the MEDIC lectures presented so far. These tapes and slides may be borrowed by an interested physician on request.

Scope: Use of the MEDIC network may be employed by physicians in the community hospitals for their own local use. For example, by means of MEDIC, they may bring to their staff the opportunity to hear discussion of a medical point by a faculty member of either of the two medical schools in the State. By so doing, they can augment their intramural efforts and supplement their local resources. Although the prime intent of such a program would be for local use, it could also be shared with other MEDIC locations, if desired. Aside from local program planning, the only additional step necessary would be to reserve the MEDIC network for the time desired. This can be done readily by simply calling the Medical and Chirurgical Faculty or the MEDIC office at the Maryland State Health Department.

The MEDIC network represents a "hospital tool." As such, it should be available for educational usage by members of paramedical organizations: nurses, laboratory technicians, x-ray technicians, dietitians, hospital administrators, record librarians, etc. This fact has been made known to representatives of each of these groups and an invitation has been extended to them to use the MEDIC facilities for their own educational purposes. Although they have not made extensive use of the network, they have availed themselves of this opportunity on several occasions.

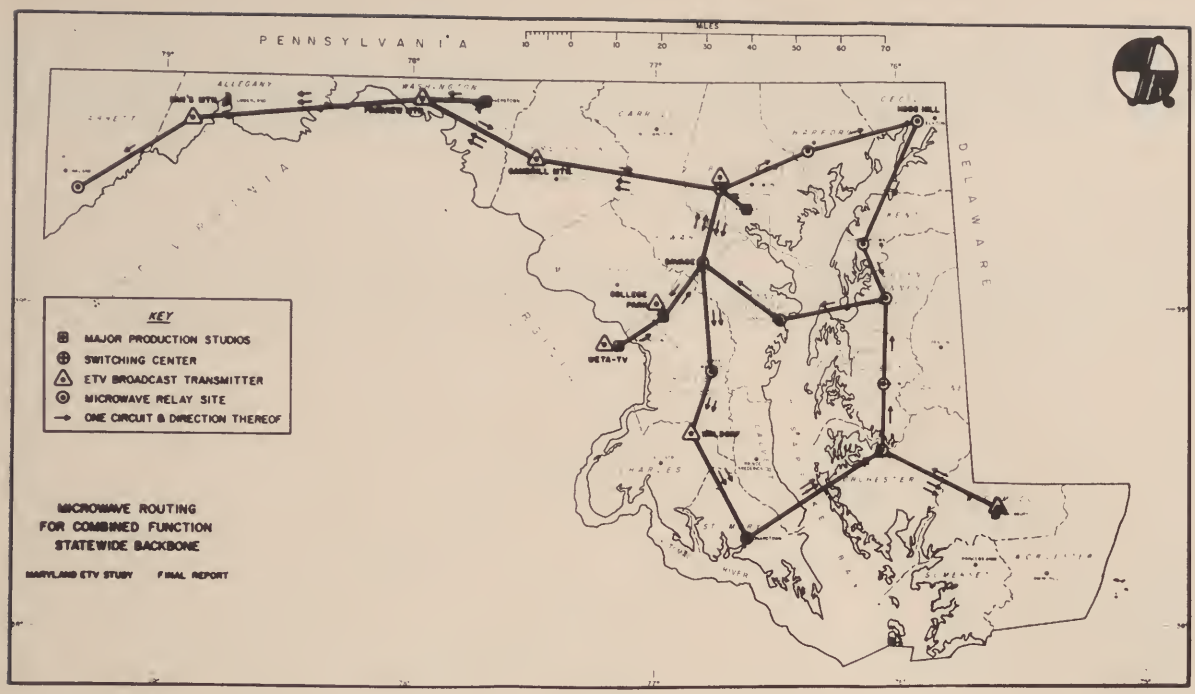

Fig 5

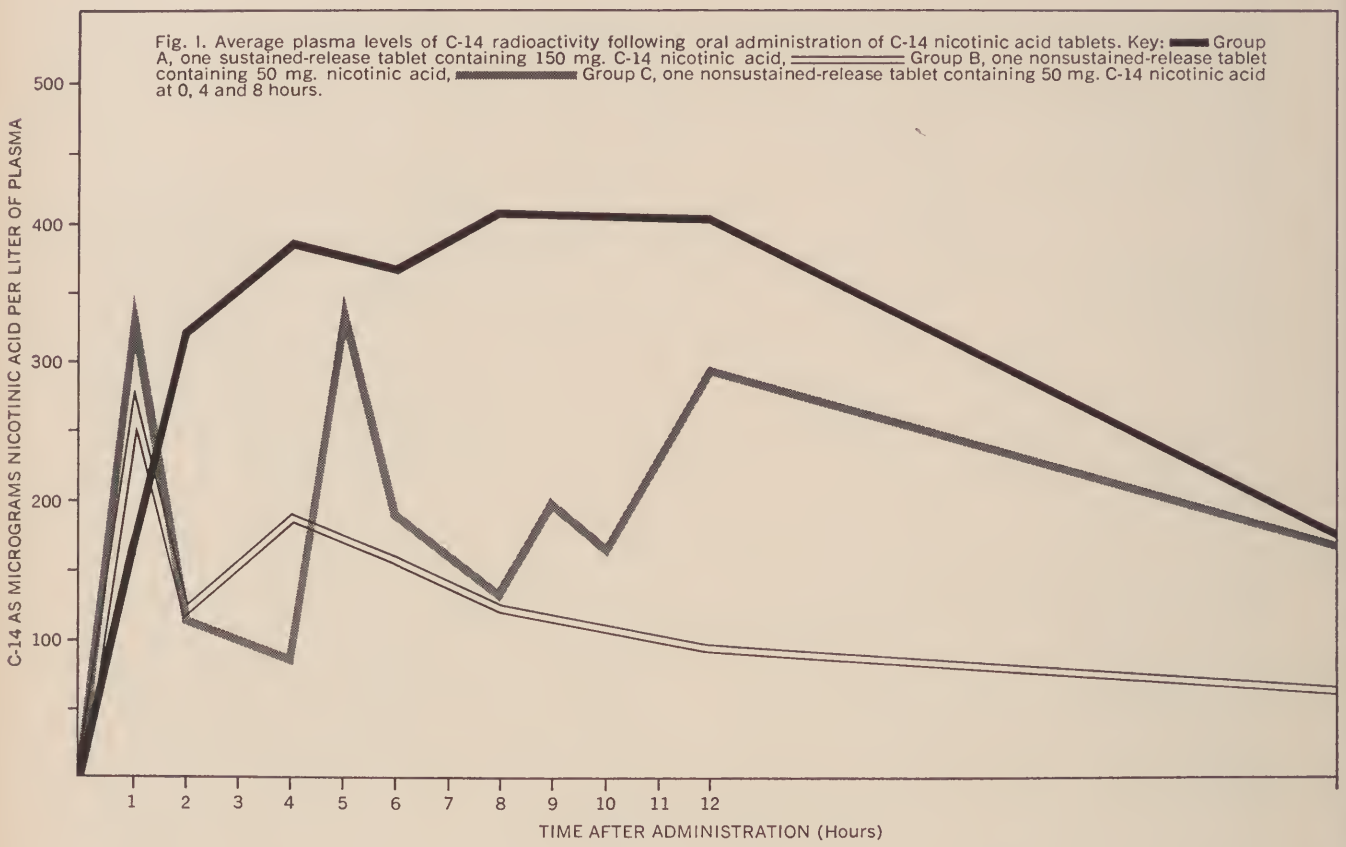
Growth: During the past 18 months, the MEDIC network has grown from its original membership of 12 community hospitals, plus the two medical schools, to 28 community hospitals, the two medical schools and three additional outlets: the Hospital Council of Maryland, the Medical and Chirurgical Faculty Building and the Maryland State Health Department. This represents a total enrollment of 30 of the general hospitals of the State out of a possible 44 (Fig 4). Twenty of these participating hospitals are located in the counties, and ten are located within the Baltimore metropolitan area. There remain seven hospitals within metropolitan Baltimore and seven hospitals in the counties of the State which have yet to join the MEDIC network. The hope is that they will join this venture and work to help MEDIC reach its optimum effectiveness. Provisions have also been made to add any of the Government hospitals in Maryland to the network, at their own cost, should they desire.



In the beginning, the original 12 community hospitals were chosen because they afforded broad coverage throughout the State. If one superimposes the locations of these 12 hospitals on the proposed lines of the educational television network for the State of Maryland (Fig 5), it becomes clear that these hospitals are situated in close proximity to them—a fact which may have potential value. It will also be noted that the 12 original hospitals are located in the counties where distance from teaching centers is a critical factor with which physicians must contend in pursuing continuing medical education. However, the goal is, and always has been, the inclusion of all hospitals in the State of Maryland within the network.

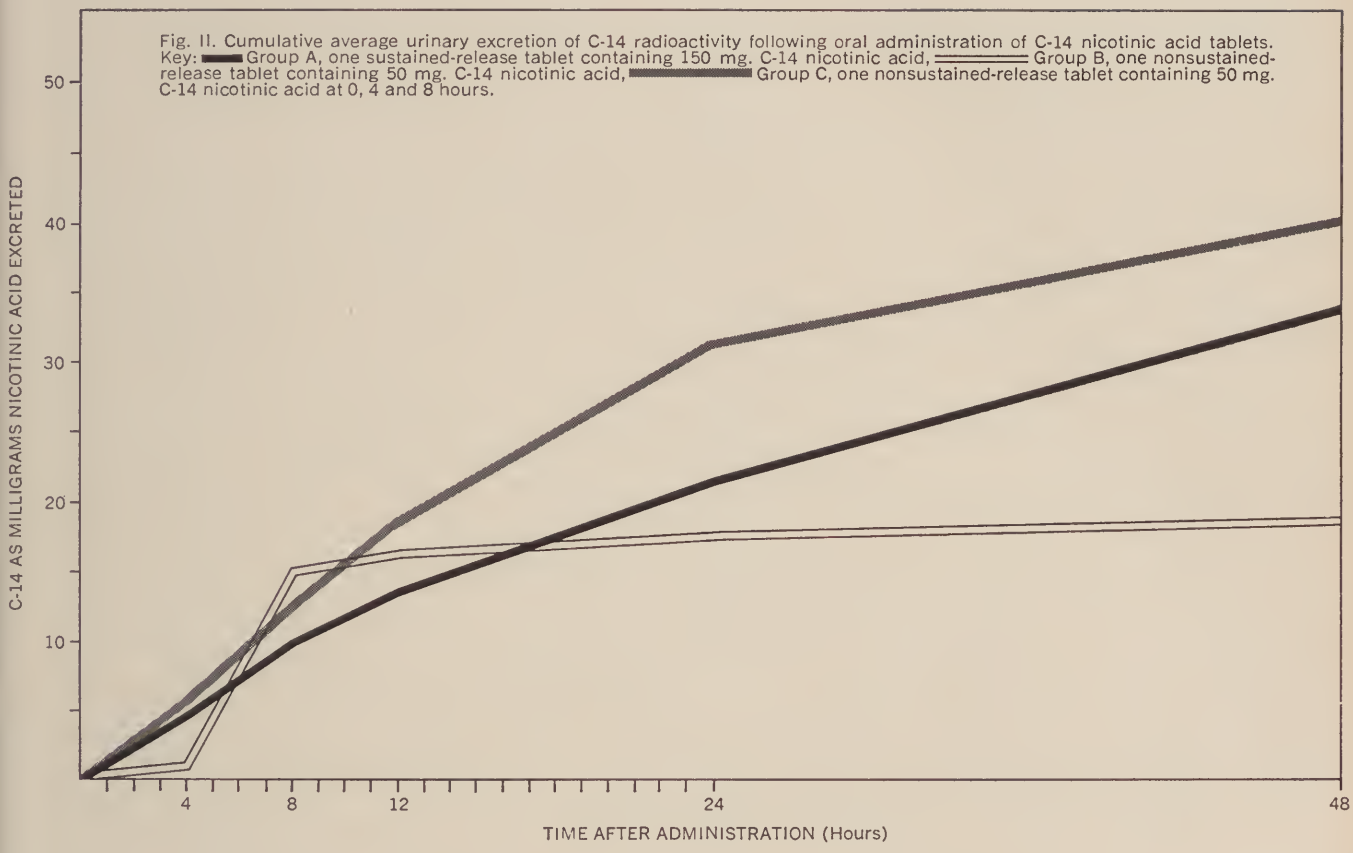
The expansion of the MEDIC network to incorporate the use of television remains a tempting plum, dangling in the future. Perhaps optimism must be tempered with realism. It should be pointed out, first, that we do not now have educational television on a statewide basis. Secondly, when and if it becomes a reality, the price will undoubtedly be high. Nonetheless, all planning for the future must certainly take into account this means of communication. While not providing a panacea, it certainly has much to offer, and in many respects it may well be superior to our present method.

It should always be remembered that continuing medical education is a personal responsibility to be met by each physician in the manner he deems most appropriate. Our hope is that MEDIC makes the task a little easier for all.

Sustained circulatory, respirator
and cerebral stimulation for th

Fig. I. Average plasma levels of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═══ Group B, one nonsustained-release tablet containing 50 mg. nicotinic acid, ▬▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

ged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

nicotinic acid 150 mg., pentylenetetrazol 300 mg.
Tempotrol® Time Controlled Tablet

Wounds, abscess, cellulitis

...and the complications of staph.

From time of birth, the child is exposed to a whole range of potential staph infections: wounds; secondarily infected dermatoses; primary lesions, such as deep impetigo (ecthyma), boils and felons; and more serious conditions such as osteomyelitis, staph pneumonia and staph meningitis.

Bactericidal

Hardly a staph organism can resist the bactericidal action of Prostaphlin® (sodium oxacillin), as shown by a 34-month *in vitro* study. Of all staph isolates tested, 99.5% were sensitive to oxacillin.[1]

Clinically Proven

There is a high correlation between these *in vitro* findings and clinical results. Of 610 patients treated with Prostaphlin (sodium oxacillin), 89.8% were reported cured or improved, including those with staph infections resistant to penicillin G.[2] And since resistance does not appear to develop *in vivo,* therapy with oxacillin can be extended when necessary.

Outstanding Safety Record

Besides being staph-specific and rapidly absorbed—Prostaphlin (sodium oxacillin) has established an outstanding record of safety during five years of widespread clinical use. Continuous high blood levels of oxacillin have not produced toxic effects on kidney function, assuring a significant margin of safety. However, as with all penicillins, the possibility of allergic response should be considered.

Capsules, Oral Suspension and Injectable

Prostaphlin (sodium oxacillin) is available in three flexible dosage forms to suit the age of the patient and severity of infection—an oral solution for pediatric use, capsules, and multi-dose vials for injection.

Staph reliably controlled with specific therapy

A suitable dosage form for every staph situation

PRESCRIBING INFORMATION: For complete information, consult Official Package Circular. *Indications:* Infections caused by Staphylococci, particularly those due to penicillin G-resistant Staphylococci. *Contraindications:* A history of severe allergic reactions to penicillin. *Precautions:* Typical penicillin-allergic reactions may occur. Safety for use in pregnancy and premature infants is not established. Because of limited experience, use cautiously and evaluate organ system function frequently in neonates. Mycotic or bacterial superinfections may occur. Assess renal, hematopoietic and hepatic function intermittently during long-term therapy. *Adverse Reactions:* Skin rashes, pruritus, urticaria, eosinophilia, nausea, vomiting, diarrhea, fever and occasional anaphylaxis. Rare cases of reversible hepatocellular dysfunction have occurred. Moderate SGOT elevations have been noted. Thrombophlebitis has occurred occasionally during intravenous therapy and leukopenia was noted in two cases. *Usual Oral Dosage:* Adults: 500 mg. *q.* 4 or *q.* 6 *h.* Children: 50 mg./Kg./day. *Usual Parenteral Dosage:* Adults: 250-500 mg. *q.* 4 or *q.* 6 *h.* Children: 50 mg./Kg./day. Treat beta-hemolytic streptococcal infections for at least 10 days. Give oral drug 1 to 2 hours before meals. *Supplied:* Capsules—250 and 500 mg. in bottles of 48. Injectable—250 mg., 500 mg., and 1 Gm. dry filled vial for I.M./I.V. use. For Oral Solution—100 ml. bottle, 250 mg./5 ml. when reconstituted. **A.H.F.S. CATEGORY 8:12.16**

SODIUM OXACILLIN

A MULTIDISCIPLINARY APPROACH TO THE TREATMENT OF ALCOHOLISM

RUTH FOX, MD
Medical Director, National Council on Alcoholism, Inc.

Treatment of the alcoholic, to be successful, must be multidisciplinary. The use of psychotherapy or counseling, disulfiram (Antabuse®), Alcoholics Anonymous, group therapy, psychodrama, occasionally LSD, sometimes hypnosis, and treatment of the families concurrently will enhance the results. In many cases the clergy may also be helpful. For the social isolation of the alcoholic, and often for his employment difficulties, it will be necessary to use the many ancillary resources of the community.

Alcoholism ranks as the fourth most important public health problem in the United States; five to six million persons are afflicted with this disease. It is exceeded in importance only by heart disease, mental illness, and cancer. For every individual suffering from this disorder, there are five or six other persons related by family or business who are adversely affected. One out of every 13 male adults over 20 years of age is an alcoholic. The cost to industry is estimated to be about two billion dollars a year. There are probably nearly one-quarter of a million individuals entering the ranks of alcoholism every year.

The social consequences of this disease are incalculable. In addition to a high morbidity and mortality rate, there is a high rate of divorce, desertion, poverty, promiscuity, illegitimate pregnancies, physical abuse, and cruelty—both mental and physical. The disruption of family and social life often leads to severe maladjustment in the children and contributes to present and future delinquency, school dropouts, psychopathy, crime, neurosis, psychosis, alcoholism, inadequate personality, etc. Significantly, 52% of a large series of alcoholics had one or both parents who were alcoholic.

The stereotype of the alcoholic as a worthless derelict is incorrect; only three percent of the total alcoholic population is on skid row. Most persons suffering from alcoholism are found in homes, offices, places of business, in every walk of life without regard to social standing, occupation, intelligence, education, national origin, color, or race. A small percentage have an underlying psychosis or psychopathy, many have an underlying personality disturbance, but many are not noticeably different from the rest of us except in their addiction to alcohol. Many alcoholics after recovery prove to be gifted, talented, generous, responsible, and idealistic people, good parents and good citizens.

Since alcoholism is a complex illness with so-

Based on a paper read at the 122nd annual meeting of the American Psychiatric Association, Atlantic City, NJ, May 9-13, 1966.

Reprinted from the *Amer J of Psychiat* **123**: 769-778 (Jan 7) 1967, by permission of the editor and the author, at the suggestion of the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland.

ciological, psychological, and physical components, no one form of treatment will be suitable in every case. Since it is an addiction, with both emotional and physiological dependence, both of these aspects must be considered in treatment. The plan of therapy will vary depending on the type of individual involved.

Where alcoholism is superimposed on an underlying psychosis, treatment in a psychiatric hospital, private or public, may be necessary. For the vast majority of cases, however, treatment can be successfully carried out on an outpatient basis after a preliminary short period of "drying out" at home, in a hospital, or at an Alcoholics Anonymous rest home. Detoxification is aided enormously by tranquilizing drugs, so that these patients can now be successfully treated even in the open wards of a general hospital[1] without causing any disruption of the normal routine of the hospital. A plan of rehabilitation should be worked out before the patient leaves the hospital—a plan which can be carried out in a doctor's office, an aftercare clinic, or an outpatient department especially geared to the alcoholic.

Definition

Alcoholism is a behavioral disturbance in which the excessive drinking of alcohol interferes with the physical or mental health of the individual. It is usually accompanied by a disturbance in the interpersonal relationships within the family, in the work life, and in the social environment. It is also an addiction, which means that there is both an emotional and a physiological dependence on the drug alcohol.

Psychiatric Aspects

As an individual finds that some drive is satisfied by alcohol, he tends to repeat the experience of drinking more and more often so that drinking gradually becomes his chief source of pleasure, as well as his chief tranquilizer. He often fails to use other avenues of self-expression, may not develop the necessary skills of living through trial and error techniques, and may avoid facing and dealing with his difficulties realistically as they arise. Through constant repetition of this behavior an individual may become dependent and addicted. This can readily happen to the shy, introverted, anxious, and conflicted adolescent or young person because alcohol at first seems to solve all his problems. As his drinking increases, his performance may begin to suffer early, with consequent school dropout, poor work record, and unsatisfactory personal relationships. There is a failure of the maturation process.

A neurotic individual may find that alcohol gives him surcease from pain, obliterating or deadening feelings of inferiority, isolation, anxiety, panic, rage, anger, obsessive rumination, conflicts, depression, sexual problems, etc. Borderline or overt psychotics may also turn to alcohol and add addiction to alcohol rather quickly to their already excessive mental and emotional burdens.

But there is another group of persons, not noticeably immature, neurotic, or psychotic, who also can become alcoholic. These are the excessive social drinkers whose drinking gradually increases over the years, though it may take 10 to 15 or 20 years of this excess before the addictive process takes over. These individuals differ markedly from the immature or neurotic or psychotic alcoholics in that they have in the past used normal avenues of self-expression to which they can revert after giving up alcohol.

As the addictive process grows, all alcoholics, no matter what their background, tend to become very much alike in their behavior.[2] It is as though the disease of alcoholism molds them into a stereotyped type of reaction. Starting off with merely a mild social or psychological dependence, a physiological dependence is added—the true addictive state—with the factors of tissue tolerance, adaptive cell metabolism, withdrawal phenomena, and "craving" occurring, which leads to a loss of control over drinking.

Added to this emotional and physiological dependence, there may develop certain organic diseases such as cirrhosis of the liver, polyneuropathy, chronic brain syndrome, Korsakoff's psychosis, etc., either as a result of the toxic effect of alcohol over many years or as a result of the unhygienic way the alcoholic lives, with neglect of food and rest, frequency of accidents, etc. These diseases are not per se a part of the addictive process but are really by-products or consequences of the addiction which may cause the individual to feel so ill that recovery is often difficult.

The many psychological studies on alcoholics have failed to reveal a specific prealcoholic per-

sonality. These studies, of course, have all been done on individuals who are already addicted and may reflect the regression in the personality due to the addictive process rather than the basic character structure of the individual. During an active addiction there is no doubt that the addict is a seriously disturbed person, unable to cope with the realities of life. As the addiction increasingly controls his life, the individual's behavior becomes grossly nonadaptive. To obtain more of the drug may be the most important thing in the world, so that responsibilities toward family, job, and society no longer matter. The lying, sneaking of drinks, and the use of household money are not, however, measures of the moral integrity of the alcoholic but are rather an indication of his very great need to maintain his addiction and to prevent the almost unbearable withdrawal symptoms which are bound to occur after cessation of heavy drinking.

When sober the alcoholic feels trapped, afraid, alone, and deeply guilty—unless, of course, he is psychopathic, when anxiety replaces guilt. Convinced that he cannot live without alcohol, he builds up an elaborate defense system in which he denies that he is alcoholic and ill, rationalizes that he needs to drink for business or health or social reasons, and projects the blame for the trouble he is in on the persons nearest to him, usually the spouse or the boss. The normal longings for recognition, prestige, and love become less and less attainable as the addiction advances, so that the alcoholic feels less and less worthy, less and less secure, and less and less loved. This downward spiral is intolerable to the alcoholic, so that he resorts to drinking again unless he can get the outside help he needs.

Personality Assessment

A battery of psychological tests done on 300 consecutive private patients showed gross disturbance in each case. Though not conforming to any one personality type, these patients showed markedly similar character traits. Characteristic of them all was low frustration tolerance and an inability to endure anxiety or tension. All showed depression, with withdrawal, sense of isolation, extremely low self-esteem, sensitiveness, and a masochistic type of self-punishing behavior. Dependency strivings were very marked, frustration of which led to depression or hostility and rage. Most showed impulsive, repetitive acting out of conflicts, with little or no insight. In all cases there was a marked hostility and rebellion, conscious or unconscious, with defiance against authority figures, and almost all showed problems in the sexual area. These tests were administered after a few weeks of sobriety and represent either a fixation at an immature level or a regression to such a state. Many of these traits were markedly improved after therapy.[3]

Treatment

With such gross disturbance in the psyche, we can see that each individual will need therapy of some sort, but what kind of therapy cannot be decided upon until sobriety has been attained and a personality assessment undertaken. Psychiatrists can then use their traditional skills with marked benefit to the patient, provided they also recognize and treat the addiction itself. To analyze a patient while he is still drinking is usually a waste of the analyst's time and the patient's money—unless motivation to abstain completely is accomplished.

Psychotic alcoholics may need prolonged hospitalization, although borderline schizophrenics may often be carried successfully on an outpatient basis providing they maintain sobriety. The neurotic alcoholic may need prolonged psychotherapy, often psychoanalysis. The immature alcoholic may need support for a long time as he matures, while the individual who has become addicted in later life and has a better integrated personality may do extremely well with a minimum of therapy provided he can be convinced that he is alcoholic and can therefore never drink again. Even in these cases a few weeks or months of therapy may be needed while he is learning about his illness and adjusting to a life of sobriety.

Alcoholism has become a way of life which is no longer tenable, and therapy is largely directed toward helping the individual find a new way to live. The prevailingly negative, fearful, and hostile feeling must be replaced by a more positive attitude with hope, self-confidence, courage, a faith in himself, and a feeling of belonging.

Most patients are not motivated to stop drinking, since alcohol has given rewards they are unwilling to give up.[4] Most patients refuse to face their alcoholism for many years, using the defensive mechanisms of denial, rationalization, regression, and projection of the blame onto the

persons closest to them. When finally confronted with the threat of divorce, loss of employment, or loss of health and prestige, they may be forced to undergo therapy.

One of the most important aspects of the doctor's job is to help the patient accept his illness. This requires sympathy, tact, firmness, perseverance, but above all, respect for the individual as an ill person but a worthwhile one. He must be helped to believe that life can be more rewarding without alcohol than with it.

As with any other long-time chronic disease, relapses are to be expected early in treatment, and the doctor should show the same patience and understanding that he would if an asthma or gastric ulcer patient relapsed. A calm discussion as to why the relapse occurred can help in understanding the dynamics underlying the case. As therapy progresses the relapses will occur less frequently and will be of shorter duration. We cannot force the alcoholic to stop drinking, but we can create a climate in which he can recover.

Attention must be paid to every aspect of the patient's life and rehabilitation must be physical, psychological, social, and spiritual—a task which is too great for any one person to undertake. Since the alcoholic frequently drinks instead of eating, he is more often than not in a state of marked deficiency of essential vitamins, minerals, amino acids, and essential fatty acids. His diet must be carefully supervised, with emphasis on high protein foods.[5] It is for this reason that the team approach is often used in clinics and hospitals for alcoholics.

1. Alcoholics Anonymous

What are some of the ways to help in treating the individual patient? Of first importance is Alcoholics Anonymous, and it is good to find out at the very first meeting what the individual knows about it and how he feels about it. Though he may vehemently reject it at first, a doctor who understands AA can often correct misconceptions about the fellowship.

AA is a pragmatic, simplified, spiritual approach to life, a prescription for living. With its 12,444 chapters in 90 different countries and hundreds of thousands of recovered alcoholics, it has probably reached and helped more persons than all the rest of us together. For patients who can and will accept it, it may be the only form of therapy needed. How one refers a patient to AA is important. Just to say "You need AA" is not sufficient and may make the patient feel that you too are rejecting him. I make a personal contact with an individual member known to me, introducing the patient to him over the telephone. There can be an immediate amelioration of symptoms as the isolated alcoholic feels that there is hope for him.

It is wise for you as a doctor to keep contact with the patient even after he goes to AA, for there may still be many problems to iron out and, of course, not all persons are amenable to the AA type of experience. AA relieves the patient of the need to prove that he can drink. When in an all-drinking group he tries again and again to prove that he is not different—only to meet with failure. In AA the norm is not to drink.

Another helpful thing about AA is the fact that the patient finally accepts the need for outside help. Many of the Twelve Steps are of great value against the rationalizations and projections and denials of the alcoholic. The sharing of problems reduces anxiety and guilt, the helping of others to recover strengthens the weakened ego, and, of course, the constant examples of others who have recovered give courage and hope.[6]

2. Disulfiram (Antabuse®)

Disulfiram is another form of therapy helpful in deterring the well motivated, not too neurotic alcoholic from drinking. This is a medication given orally which interferes with the metabolism of alcohol so that even one drink will cause a toxic reaction of a shock-like nature. When not on disulfiram the alcoholic fighting the urge to drink may have to say "no" to this impulse several hundred times a day. When on disulfiram he needs to make but one decision, and that is on the taking of the pill. The effect lasts four days, which of course abolishes all impulsive drinking. Since the pill is taken every day, the ability to drink safely is well in the future. It also abolishes the preoccupation with drinking, which frees the mind for other things. Then, too, it helps the distressed family to know that the patient is even temporarily safe from alcohol. Most patients get a great lift from feeling that they *can* live without alcohol.

The dose of disulfiram is one pill (.5 gm) daily for five days, then one-half pill (.25 gm) for an

In Diabetes,[1] Arthritis,[2] and Peripheral Vascular Disorders[2]

now... specific therapy for night leg cramps

QUINAMM™

Consistently effective, QUINAMM provided complete relief in 94% of 200 patients studied, many of whom were severe cases refractory to other medication.[3] Your prescription for one tablet at bedtime often controls painful night cramps with the initial dose . . . helps restore restful sleep.

QUINAMM Prescribing Information: Composition: Each white, beveled, compressed tablet contains: Quinine Sulfate 4 grains (250 mg.) and Aminophylline 3 grains (200 mg.). **Precautions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Contraindication:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets. **Caution:** Federal law prohibits dispensing without prescription.

"Take a laxative" is a harsh sentence

Although there are more than 60 ethical laxatives available for the constipated patient, many, unfortunately, do not really produce an effect much like a normal bowel movement. Instead they whip the bowel, torment it and leave it irritated, inflamed and exhausted.
On the other hand, Dulcolax provides a nearly normal movement. Through its unique contact action, it induces the kind of natural contraction waves of the colon necessary for gentle, complete, comfortable bowel movements.
For your next constipated patient, try Dulcolax–the laxative with the gentle touch.

V-Cillin K® Lilly 7QA157

Potassium Phenoxymethyl Penicillin

(See next page for prescribing information.)

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K is the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly). This chemically improved form combines acid stability with immediate solubility and rapid absorption. Higher serum levels are obtained more rapidly with this penicillin than with equal oral doses of penicillin G. The higher serum levels and acid stability of V-Cillin K make it a more dependable penicillin for oral use.

V-Cillin K, Pediatric, is an oral solution of clinically proved V-Cillin K in teaspoon dosage form. When mixed as directed, each 5 cc. (approximately one teaspoonful) will contain 125 mg. (200,000 units) phenoxymethyl penicillin as the potassium salt.

Indications: V-Cillin K has been shown to be effective in the treatment of streptococcus, pneumococcus, and gonococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy and tooth extraction in those patients with a history of rheumatic fever or congenital heart disease.

Contraindication: V-Cillin K should not be administered to a patient with a history of penicillin hypersensitivity.

Precautions: V-Cillin K should be used cautiously, if at all, in a patient with a strongly positive history of allergy. Reactions occur more frequently in individuals with bronchial asthma or other allergies or in those who have previously demonstrated sensitivity to penicillin. hypersensitivity reactions occur, the drug should be discontinued.

Adverse Reactions: Although serious allergic reactions are mu less common with administration of oral penicillin than with intramus lar forms, skin rash, symptoms resembling those of serum sickness, other manifestations of penicillin allergy may occur. When penicillin administered, measures for treating anaphylaxis should be read available. Those include epinephrine, oxygen, and pressor drugs f relief of immediate allergic manifestations as well as antihistamin and corticosteroids for delayed effects.

The use of antimicrobial agents may be associated with the ov growth of antibiotic-resistant organisms; in such a case, antibiotic a ministration should be stopped and appropriate measures taken.

Administration and Dosage: For Tablets V-Cillin K and for V-Cil K, Pediatric, the usual dosage ranges from 125 mg. (200,000 unit three times a day to 500 mg. (800,000 units) every four hours. For i fants, the daily dosage may be 50 mg. per Kg. of body weight divid into three doses.

Beta-hemolytic streptococcus infections without associated bact remia may be treated with 200,000 to 400,000 units three times a da Therapy should be continued for a minimum of ten days to prevent d velopment of rheumatic fever and/or other serious complications. Do age for routine streptococcus prophylaxis in patients with a history rheumatic fever or congenital heart disease may be 200,000 units on or twice daily. When such patients undergo tonsillectomy, tooth extra tion, or other minor surgery, the prophylactic dose should be 500,0 units every six hours given two days prior to surgery and for two da postoperatively. If oral medication is not feasible on the day of su gery, parenteral therapy should be considered. Mild to moderate severe pneumococcus pneumonia has been treated effectively wi 250 mg. every six hours.

In staphylococcus infections, 400,000 units or more should be giv every six to eight hours in conjunction with indicated surgical proc dures.

For gonorrhea in males, 500 mg. (800,000 units) every six hours f three doses may be employed; in females, 500 mg. every four hours f six doses are recommended. Patients with a suspected lesion of syphi should have a dark-field examination before receiving penicillin a monthly serologic tests for a minimum of three months.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 units), bottles of 50 and 100; 250 mg. (400,000 units), and 500 mg. (800,0 units) in bottles of 24 and 100.

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,000 units) p 5 cc. of solution, in 40, 80, and 150-cc.-size packages.

Additional information available to physicians upon request. Eli Lilly and Company, Indianapolis, Indiana 46206.

Lilly

indefinite period of time. One of my patients is in excellent health after 15 years on the drug. Most patients should take it for at least two years while undergoing psychotherapy or adjusting to AA. There are no contraindications to its use except a decompensated heart or a psychosis. Disulfiram is not a dangerous drug provided the patient understands thoroughly the consequences which would ensue if he did drink and if the dosage is kept at the level suggested above.[7]

3. Psychoanalysis

Although one cannot underestimate the value of psychodynamic concepts in understanding the neurotic constitution, psychoanalysis alone as a technique has produced meager results with alcoholics. As an example I can tell you of one case, a psychoanalyst himself, whose drinking grew steadily worse during 17 years of analysis. Disulfiram, after one short slip at the end of one year, helped him attain complete and productive sobriety until his nonalcohol-connected death seven years later. After attaining sobriety he said, "I had all the *insights* I needed but I couldn't utilize them as long as I drank. Now, with sobriety, they are a great help."

I believe psychiatrists are in error in considering that alcoholism is *merely* symptomatic of an underlying personality disturbance and that treatment of the latter will cause the excessive drinking to cease. Unless the addiction itself is recognized and help given to the patient to attain sobriety, there cannot be a successful outcome. After sobriety has been attained, the patient may then be responsive to the various techniques of psychotherapy.

4. Group Therapy

Group therapy is perhaps the most effective type of treatment for the alcoholic aside from AA. There is almost immediate identification and mutual support, which makes the alcoholic feel immediately accepted. The group represents a nonthreatening, socially rewarding yet challenging atmosphere in which their many problems can be discussed. Problems about drinking, their jobs, and their families come up first, but soon they begin to discuss and show their deeper feelings of anger, resentment, sensitivity, guilt, distrust, loneliness, depression, fear, sense of inferiority, and worthlessness. When met with the sympathetic warmth and understanding tolerance of the group, many of these painful feelings are drained off.

The various interactions between members of the group, both negative and positive, give a chance for analysis of typical modes of reaction in the outside world, many of which are found to be of an irrational or transference variety. Typical maneuvers or defenses, such as denial, rationalization and projection become evident and are discussed in nontheoretical terms. Many strong and lasting friendships grow up in the group.[8]

Group therapy of the spouses of alcoholics has also been found to be of great help. Several studies of the wives of alcoholics have shown them often to be greatly disturbed individuals. Some of their neurotic traits antedated the marriage, but many are a direct result of the crisis of living with an alcoholic. The organization called Al-Anon Family Groups, an off-shoot of AA, is a fellowship for the family members of the alcoholic and has proved extremely helpful, as has Alateen for the teen-age children of alcoholics. So many spouses have become bitter, lonely, vindictive, and punishing—attitudes which militate against recovery of the sick alcoholic. Many times the wife has to be helped to cease overprotecting the alcoholic, for he must eventually learn to accept the consequences of his actions.[9]

5. Psychodrama

Psychodrama has been found to be especially effective for many patients.[10] One individual is picked or picks himself to be the star or the protagonist of the evening. He soliloquizes first about some problem of the past, present, or future until a scene evolves, with other patients playing the roles of significant others—the wife or husband, boss, parent, child, or friend. Psychodrama requires direction by an especially trained psychodramatist* able to use the various techniques such as auxiliary ego, doubling, or role reversal, all of which help to clarify the true underlying feelings.

It has been found that patients reach a high level of emotional involvement rather quickly in psychodrama. One short example may serve to illustrate what can happen. One patient, a middle-

*All of my sessions were conducted by Miss Hannah Weiner of Brooklyn, NY.

DIARRHEA

CANTIL®
(mepenzolate bromide)

Diarrhea, one of the most vexing symptoms of common G. I. disorders can often be curbed with Cantil (mepenzolate bromide), bringing welcome relief to the harassed patient. Relatively specific for the hyperactive colon, it helps reduce diarrhea, pain and spasm with minimal effect on other viscera. Cantil (mepenzolate bromide) is indicated whenever these symptoms are associated with irritable colon, gastroenteritis, diverticulitis, and mild to moderate ulcerative colitis.

It is an anticholinergic drug without narcotic properties. Side effects are usually mild.

LAKESIDE

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth, blurring of vision, constipation, nausea, vomiting, bloating and dizziness may occur but are usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy — withhold in glaucoma. Contraindicated in patients sensitive to phenobarbital and/or Cantil (mepenzolate bromide); in toxic megacolon, obstruction of G. I. or G. U. tract.

SUPPLIED: CANTIL (mepenzolate bromide) — 25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL — containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

aged social worker, had lost his job through drinking and went into a deep depression. After a few weeks of nonparticipation in the group, the patient began to talk about the time his drinking became excessive. This was immediately following the unexplained death of his son in college; it had never been clear whether this was a suicide or not. Another younger patient immediately went over and sat down by his side, playing the role of the now dead son. The younger man insisted that his death had been due to a heart attack and was not suicide. He further showed that he had had great love for his father and admired him greatly.

Role reversal was needed, with a recall of many things the two had done together. This gave an opportunity for the younger man, who had been fighting with his father all of his life, to become friendly with an older man and say many of the things he had never been able to say in reality to his own father. The older man was able to give up many of his guilt feelings as he related affectionately to his "son." This little psychodrama helped jar both persons out of their frozen, nonadaptive roles and helped initiate a recovery in both which has been maintained for years.

6. Lysergic Acid Diethylamide

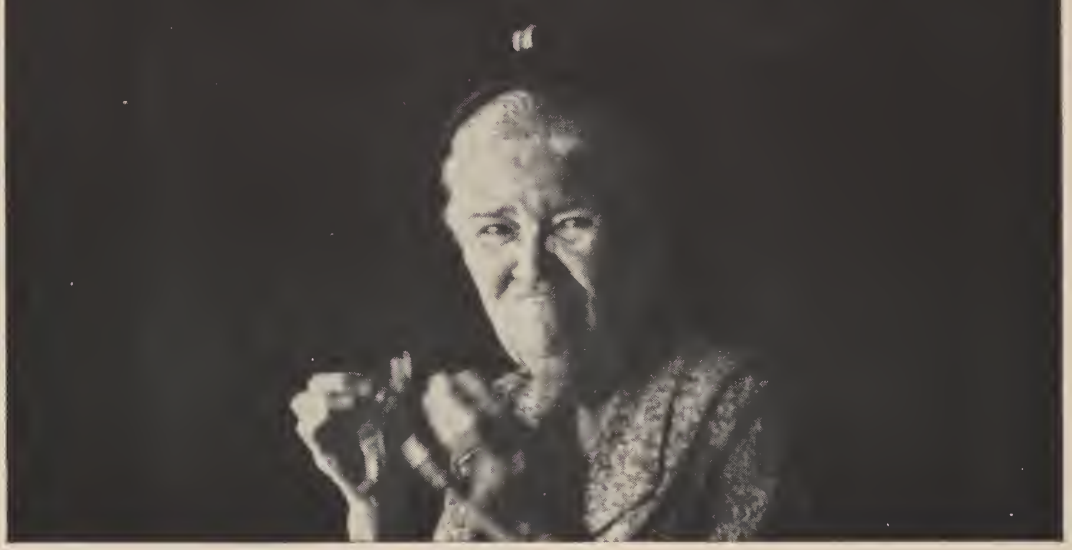
Although my experience with lysergic acid diethylamide (LSD) in alcoholism has been limited to only 20 severe, recalcitrant alcoholic cases, the results are sufficiently promising to lead me to hope that it can be studied with much larger groups. Extensive studies have been made on alcoholics by Dr. Abram Hoffer[11] of the University Hospital in Saskatoon, Saskatchewan, Canada, and Dr. Keith Ditman[12] of the Alcoholism Research Clinic at the University of California Medical Center in Los Angeles, with claims of marked improvement in a sizable proportion of alcoholic patients.

My final impression on a three-year follow-up of the 16 patients (out of 20) who showed improvement was that LSD was but one of the factors which helped in their very considerable over-all improvement. It does seem that LSD, by breaking down the barriers between the conscious and the unconscious mind and by uncovering early traumatic events in their lives, allows the patients to reassess and reevaluate many of their experiences. Many get a new concept of themselves and others, giving up many of their rigid defenses in favor of a more open and optimistic view. LSD does seem to make the patient more willing to undertake the total program necessary for his recovery. After LSD most of the patients who formerly had refused to cooperate were willing to take disulfiram, attend group therapy and psychodrama, and to affiliate with AA. Those who at the same time were undergoing an analytic form of therapy seemed to make more rapid progress.[13]

One disturbed young man who had blamed his "cruel" parents for his drinking, and who had refused to speak to them for ten years, had flashbacks of memories from early life of his parents taking him and his brother swimming, fishing, to the circus, etc. He realized that he had been loved by them and felt flooded with affection and understanding for them. One week after LSD he went to see them and the following summer took them on a vacation to Ireland. They are still good friends, and the abstinence attained is still present after four years.

It cannot be overstressed that a patient undergoing LSD treatment must not be left alone for at least eight to ten hours while under the drug and must be given constant support during the treatment. Several individual sessions after the LSD must be held in order to integrate the material uncovered into the total therapy program.

7. Aversion Treatment



Aversion treatment of alcoholism still continues in a few places in the United States and more generally in England and Russia. Aversion can be produced chemically by giving the patient emetine or apomorphine,[14, 15] which produces vomiting within seven to eight minutes. One or two minutes preceding the vomiting the patient is given many types of alcoholic drinks, which he vomits. He then associates the sight, smell, and taste of alcohol with vomiting. This aversion to alcohol in some cases may last for many years.

A new type of conditioning is being carried out in a few places using succinylcholine. This preparation causes muscle paralysis so that the patient is unable to breathe for 30 to 40 seconds. Just preceding this he smells and tastes alcohol. The paralysis of breathing is associated with profound fear, which is then associated with drinking.[16, 17]

Other techniques using learning theories are

IRON DEFICIENCY

ANEMIA

Imferon®
(iron dextran injection)

There's as much iron . . . 250 mg. . . . in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron . . . or orally administered iron proves ineffective or impractical . . . or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves. Precise dosage is easily calculated.

LAKESIDE

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as a source of iron; infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

under investigation by the behavior therapists. One of these is the use of moderately painful electrical stimulation to the hands or head at the time of drinking. Treatment by reciprocal inhibition also shows promise.[18]

8. Hypnosis and/or Relaxation

Although I believe that teaching a tense, nervous person to relax is of great value and will often improve his sleep pattern, I doubt whether the compulsion to drink is much influenced by either relaxation exercises or hypnosis. The good results may well be placebo effects which may or may not be lasting, depending on the *total* therapy situation. If the alcoholic really wishes to drink, he will either resist going into a trance or will subsequently resist the post-hypnotic suggestion of not drinking. If he does wish to stop, suggestions to reinforce this determination will surely help, but this may be done about as well at the conscious level as under hypnosis.

However, Dr. Lincoln Williams, who has had extensive experience using hypnosis as an adjunct to psychotherapy in alcoholic patients, states that if patients can achieve a really deep trance, suggestions that they will henceforth be indifferent to alcohol may be partly successful. He sees the patients daily for ten days and teaches them auto-hypnosis. He stresses the fact that this is only an adjunct to psychotherapy.[19]

A report has just appeared in which a well-controlled study of 40 patients carried out at the Maudsley Hospital, London, failed to show any greater improvement in the 20 who were given hypnotic suggestions than in the 20 who were not. All patients were given disulfiram and attended AA. All received individual psychotherapy, and social rehabilitation and social casework were available to all as required.[20]

Probably further work must be done in this field before we discard hypnosis entirely as an effective adjunct. Perhaps the depth of trance is important, as well as the personality of the therapist and the expectation of the patient.

9. Treatment of Families

Treatment of the families of alcoholics has been found to help greatly in the recovery of the patient. By early detection and successful treatment, many social ills can be greatly ameliorated, for alcoholism ranks high as a contributing cause in many disturbances of children and adolescents. Having often come from a disturbed family background himself, the alcoholic "disturbs" his own family, so that he helps to pass on a neurotic heritage—a kind of "social contagion." Probably no family in which there is an alcoholic can be considered a happy one. In spite of a brave front, the lives of many are being insidiously and painfully wrecked beyond any possibility of future mental health.[21]

The wife of an alcoholic may seem on the surface to be just an innocent victim of her husband's drinking, but a number of studies have shown her to be often almost as neurotically ill as her husband.[22] Many are insecure persons who picked their mates to satisfy some neurotic needs of their own and in their disappointment and frustration at the husband's irresponsibility and general inadequacy retaliate by an active or passive type of punishment which renders the husband all the more inadequate and drives him inevitably into further and deeper drinking. Some of the neurotic needs of such a wife may be to be dependent, to control, to dominate, to punish, or to be the long-suffering martyr—character traits which make such a woman not only a poor wife but generally a poor mother as well.

Indeed, sometimes her effect on her children may be more destructive than that of their drinking father. If she is unable to love, this may be even more detrimental to her child's development than her husband's inability to remain sober. Of course, many of the wives were quite normal persons before the alcoholism developed but have become frightened, frustrated, angry, and extremely disturbed due to the ever-recurring crises in an alcoholic family.[23]

These women are badly in need of help and understanding of themselves as well as their husbands. They may need to learn in what way they may be interfering with their husbands' recovery. A wife is not responsible for her husband's being alcoholic, of course, for this is his own illness, but she may be totally unaware that her reaction to his behavior is actually making the situation worse. Group therapy for her own neurotic problems, or Al-Anon,[9] or both, may give her the insights she needs to help him recover. Alateen is proving of great help to the children of alcoholics.

DIURESIS

MERCUHYDRIN®
(meralluride injection)

Twenty years ago the publication of "A System for the Routine Treatment of the Failing Heart"[1] established a schedule of diuretic therapy as a primary factor in the treatment of acute congestive failure. With emphasis upon daily injections of Mercuhydrin (meralluride injection) until dry weight was obtained, Gold, et al. achieved a 40% increase in improvement, in ⅓ the time, over other methods then current. Today, most medical texts continue to recommend parenteral mercurials in acute congestive failure when prompt diuresis is indicated.

Recently Modell[2] has stated: "The mercurial diuretics are the injectable diuretics of choice since they are the most potent as well as the most dependable. Their toxicity is not an important consideration either by comparison with other potent diuretics or in relation to the seriousness of the conditions in which they provide such excellent relief."

LAKESIDE

IN BRIEF

Mercuhydrin is indicated in edema of cardiac or hepatic origin and in the nephrotic syndrome; it is contraindicated in acute nephritis and in anuric or oliguric states. *The usual adult dose is one to two cc. daily or every other day until "dry weight" is obtained.* Sensitivity is rare but small initial doses are advised to minimize potential reactions; vertigo, fever, and rash have occurred. Overdosage may produce electrolyte depletion, muscle cramps, and G.I. reactions. Supplied: 1 cc. and 2 cc. ampuls in boxes of 12, 25 and 100; 10 cc. rubber capped, multiple-dose vials (intramuscular or subcutaneous use only) in boxes of 6 and 100.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

Clergy

Clergymen have their own important and special contribution to make to the problem of alcoholism by helping in its recognition as a disease, by urging proper treatment in hospitals and clinics for the individuals involved, by supporting the families who are attempting to adjust to the problem, by accepting the alcoholic as part of the fellowship of the church, and by contributing their part to the team of workers—medical, legal, and lay—who will be necessary for the eradication of this devastating illness.[24]

Prevention

Since no disease has ever been controlled only by the treatment of the victims of the illness, efforts should be made to prevent alcoholism. This can be envisioned on three levels.

The first is the prevention of further deterioration of the person already alcoholic. The second is early case finding and special care for the population which is most vulnerable, that is, disturbed adolescents and young adults, particularly those who come from alcoholic families. Although there is no definite evidence as yet that alcoholism is inherited, it could certainly be considered contagious.

The third level of prevention will require vast changes in our cultural attitude toward alcoholism. Recognition that alcoholism is a disease and not a moral weakness will help remove the stigma which prevents so many persons from seeking help. There should be emphasis on the advisability of moderate drinking, with a de-emphasis on drinking as the only method of coping with problems or as the chief form of pleasure. This would require a change in our system of values.

Aims of Therapy

The aims of therapy of the alcoholic are not only total and complete sobriety for life but a better functioning in all areas of his life. An attempt is made to free him from his fixed and destructive role and to help him develop a greater awareness of self, a greater flexibility and adaptability, and a greater sense of his own potential. If therapy is successful there will be a growth away from the egocentricity of addiction to a social sense and an ability to relate and share with others.

Results of Treatment

Good follow-up studies of treated alcoholics have been rare until the past few years. No attempt will be made here to review this by now considerable literature, since a separate article is being prepared. "Cure" in terms of being able to go back to moderate social drinking is considered impossible by most doctors working with alcoholics, although there may be an occasional patient who can do so. Among my own approximately 3,000 patients not one has been able to achieve this, although almost every one of them has tried to. Total sobriety is usually a necessity before personality growth can occur.

Because alcoholics are an extremely heterogenous group, with very different potentials for recovery, control studies have to be set up carefully at the beginning of any research project.

In general the results of treatment of the homeless alcoholic on skid row with his weak inner resources and his poverty have been poor. Punitive measures have been totally ineffective, while newer techniques using a half-way house approach and/or the enforced giving of disulfiram by a probation officer have made it possible for many to remain sober, learn a trade, and get back into the work force—first steps in rehabilitation.[25]

Alcoholics who still live in a family setting and are still employable have a higher recovery rate. This can be shown clearly in the results obtained among the 200 or more large industries which have established programs of early case finding and treatment of their alcoholic employees. In some companies the recovery rate is 70% to 80%.[26]

Although AA keeps no statistics, they claim that of those who sincerely try to use their program, roughly one-third remain abstinent, one-third are much improved, and one-third are not improved.

One of the few well-controlled experiments was done by Dr. Robert Wallerstein in a Veterans Administration hospital. A two-year follow-up of 178 alcoholics showed that 53% of those given disulfiram plus group therapy improved; 36% of those given hypnotherapy plus group therapy improved; 26% of those given "milieu therapy" (group therapy plus individual therapy) improved; while only 24% of those given conditioned

DEPRESSION

NORPRAMIN®
(desipramine hydrochloride)

ANTIDEPRESSANT FOR RAPID IMPROVEMENT

At the recommended dosage level —initially, 150 mg. per day— gratifying remission of the signs and symptoms of depression typically begins in 2-5 days. Its specificity for depression, rapidity of action and usually mild side effects are significant reasons for prescribing NORPRAMIN (desipramine hydrochloride) In depression of any type . . . any degree of severity.

A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

LAKESIDE

IN BRIEF:

INDICATIONS: In depression of any kind —neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

CONTRAINDICATIONS: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease, epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor.

RELATIVE CONTRAINDICATIONS: (1) Patients with a history of paroxysmal tachycardia. (2) Patients receiving concomitant therapy with thyroid, anticholinergics or sympathomimetics may experience potentiation of effects of these drugs. (3) Safety in pregnancy has not been established.

PRECAUTIONS: (1) Outpatient use of desipramine hydrochloride should not be substituted for hospitalization when risk of suicide or homicide is considered grave. (2) If serious adverse effects occur, reduce dosage or alter treatment. (3) In patients with manic-depressive illness a hypomanic state may be induced. (4) Discontinue drug as soon as possible prior to elective surgery.

ADVERSE EFFECTS: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, anxiety, agitation and stimulation, insomnia, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, tremor, allergy, agranulocytosis, altered liver function, ataxia, and extrapyramidal signs.

DOSAGE: Optimal results are obtained at a dosage of 50 mg., t.i.d. (150 mg./day). **SUPPLIED:** NORPRAMIN (desipramine hydrochloride) tablets of 25 mg.; bottles of 50, 500 and 1000; and tablets of 50 mg., in bottles of 30, 250 and 1000.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

reflex therapy plus group therapy improved. The authors concluded that disulfiram treatment was best for the compulsive patient, conditioned reflex treatment was best for the clinically depressed patient, and group hypnotherapy was best for the passive dependent patient.[27]

I feel that successful results in treating the alcoholic depend on many factors, a few of which are the genes he is born with, the type of family which reared him, his age, his physical health, the number of years of drinking, his ability to endure stressful situations, his motivation to recover, his prealcoholic degree of adjustment, his intelligence, his education, his socioeconomic level, his living arrangements, his marital status, the cooperation or lack of it by spouse or family, his type of work, his employability, the drinking habits of his associates, etc.

Recent biochemical studies in alcoholism may help us to understand how the metabolism of these patients differs from that of normal or social drinkers. Studies on the molecular basis of memory, drives, emotions, etc, may eventually lead to a greater understanding of all human behavior—that of the alcoholic as well as that of the non-alcoholic.

Successful results may depend also on the accepting attitude of the physician he sees, his competence and his knowledge about alcoholism, his willingness to share the treatment with such groups as AA, the available resources of the community such as hospital beds, rest homes, half-way houses, trained group therapists, etc. Knowledge about local resources can be obtained by consulting the information centers of the affiliates of the National Council on Alcoholism. There are 82 such affiliates in the United States. The national headquarters of the National Council on Alcoholism are at 2 East 103rd Street, New York City.

I believe that 60% to 80% of well motivated middle and upper income patients who will undertake such a multi-disciplinary type of therapy as described above and who will pursue it faithfully for one to two years will recover. Although relapses can be expected, as in any chronic disease, these will occur less frequently and be more quickly overcome as treatment progresses.

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide.....195 mg.
Aminophylline.....130 mg.
Phenobarbital, Caution: May be habit forming... 21 mg.
Ephedrine HCl..... 16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

SKIN PROBLEMS

Caused by itching due to:

Dry Eczema	Acne
Chafing	Ivy Poisoning
Minor Burns	Cold Sores
Athlete's Foot	Heat Rash
Dry Skin	Diaper Rash
Wind Burn	Chapping
Insect Stings	Hemorrhoids

For Safe, Sure, Speedy Relief—
—Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching

New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, **Resinol Greaseless Cream** was developed. . . . A doctor's formula containing safe yet powerful ingredients, **Resinol Greaseless** contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try **Resinol Greaseless** . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today

WASHINGTON COUNTY

The second annual Sports Seminar sponsored by the Washington County Medical Society will be held on April 1, 1967, at the South Hagerstown High School.

Registration will begin at 9:00 AM and the first paper will be presented at 10:00 AM by **Frank McCue, MD,** team physician for the University of Virginia.

Other papers to follow will be presented by **Percy Miller, MD,** of Hagerstown and **John Walmer, MD,** of Penn State.

The afternoon session will consist of a panel on training methods in football, basketball and track. A taping clinic will be conducted by the training staff of the University of Delaware.

The exhibitors will include Riddell, Rawlings, Converse, MacGregor-Brunswick, Wilson and Parke-Davis.

Luncheon will be served at the South Hagerstown High School cafeteria and will be included in the $1 registration fee.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

AMA Action on Alcoholism as a Medical Responsibility

In December, 1966, the House of Delegates of the American Medical Association agreed that "alcoholism is a disease that merits the serious concern of all members of the health professions," and that the medical profession should provide leadership toward implementation of the historic 1956 "Report on the Hospitalization of Patients with the Diagnosis of Alcoholism."

The following five recommendations were adopted:

1. That state medical associations and component medical societies establish liaison and work with hospital medical staffs and with state and local hospital associations to implement the 1956 Statement of the Council on Mental Health;

2. That the 1956 Statement of the Council on Mental Health be resubmitted to the Joint Commission on Accreditation of Hospitals with the request that it give all possible assistance in implementing the Statement, through its publications and correspondence and through the members of its administrative and survey staff;

3. That in those hospitals which do not admit patients with the diagnosis of alcoholism the governing board, administration, and medical staff consider feasible means for providing for the admission of such patients, including, where necessary, the revision of the hospital's charter and bylaws;

4. That in those hospitals which do not admit patients with the diagnosis of alcoholism, hospital medical staffs be encouraged to review for the previous year those charts where alcoholism might have been an admitting factor. If, in fact, alcoholics are being admitted, the hospital medical staff and governing authorities should be encouraged to take a more realistic approach to the admission and handling of these patients; and

5. That insurance companies and prepayment plans be encouraged to remove unrealistic limitations on the extent of coverage afforded for the treatment of alcoholism, recognizing that alcoholism is a chronic illness and that multiple hospital admissions under medical supervision may be essential to arresting the progress of the disease.

Historic Statement

The 1956 Statement, reaffirmed ten years later by the House of Delegates, follows:

1. Alcoholic symptomatology and complications which occur in many personality disorders come within the scope of medical practice.

2. Acute alcoholic intoxication can be and often is a medical emergency. As with any other acute case, the merits of each individual case should be considered at the time of the emergency.

3. The type of alcoholic patient admitted to a general hospital should be judged on his individual merits, consideration being given to the attending physician's opinion, cooperation of the patient, and his behavior at the time of admission. The admitting doctors should then examine the patient and determine from the history and his actions whether he should be admitted or refused.

4. In order to offer house officers well-rounded training in the general hospital there should be adequate facilities available as part of a hospital program for care of alcoholics. Since the house officer in a hospital will eventually come in contact with this type of patient in practice, his training in treating this illness should come while he is a resident officer. Hospital staffs should be urged to accept these patients for treatment and co-

operate in this program.

5. With improved means of treatment available and the changed viewpoint and attitude which places the alcoholic in the category of a sick individual, most of the problems formerly encountered in the treatment of the alcoholic in a general hospital have been greatly reduced. In any event, the individual patient should be evaluated rather than have general objection on the grounds of a diagnosis of alcoholism.

It is recognized that no general policy can be made for all hospitals. Administrators are urged to give careful consideration to the possibility of accepting such patients in the light of the newer available measures and the need for providing facilities for treating these patients. In order to render a service to the community, provision should be made for such patients who cooperate and who wish such care.

In orded to accomplish any degree of success with the problem of alcoholism, it is necessary that educational programs be enlarged, methods of case finding and follow-up be ascertained, research be encouraged, and general education toward acceptance of these sick people be emphasized. The hospital and its administration occupy a unique position in the community which allows them great opportunities to contribute to the accomplishment of this purpose. It is urged that general hospitals and their administrators and staffs give thought to meeting this responsibility.

The full ¼ grain of phenobarb in the formula

takes the nervous edge off the pain ...helps bring out the best in codeine

Phenaphen® with Codeine

the only leading compound analgesic that calms instead of caffeinates

Each capsule contains:

Phenobarbital (¼ gr.) ..... 16.2 mg.

(Warning: may be habit forming)

Contraindications: Hypersensitivity to any ingredient.

Precautions: As with all phenacetin-containing products, avoid excessive or prolonged use.

Side Effects: Side effects are uncommon—nausea, constipation, and drowsiness have been reported.

A-H-ROBINS

A. H. ROBINS CO., INC., Richmond, Va. 23220

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

700121

Ilosone®
Erythromycin Estolate

Lilly

(See next page for prescribing information.)

Ilosone®/ the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by microorganisms sensitive to its action (especially staphylococci, hemolytic streptococci, and pneumococci). The drug is therefore useful in a high proportion of bacterial diseases encountered in clinical practice and particularly in the treatment of bacterial infections of the upper and lower respiratory tract and soft tissues.

In the treatment of acute bacterial pharyngitis and tonsillitis, this antibiotic has promptly eradicated the bacteria (streptococci) and has produced a parallel prompt clinical improvement. There have been no group A beta-hemolytic streptococci resistant to this preparation. In beta-hemolytic streptococcus infections, treatment should be maintained for ten days to prevent the development of rheumatic fever or glomerulonephritis.

Erythromycin estolate has proved to be very effective in pneumococcus pneumonia and in acute bronchitis with pneumococci on culture. Bronchopneumonia and otitis media in children have responded well to its use.

The antibiotic has been used very successfully in staphylococcus infections. Good therapeutic results have been obtained in soft-tissue infections, abscesses, cellulitis, carbuncles, wound infections, and furunculosis.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents. As is the case with any treatment regimen used in these severe conditions, surgical procedures should be performed when indicated, and large dosages of the antimicrobial agents should be employed. In this fashion, Ilosone has been effective in staphylococcus pneumonia, osteomyelitis, septicemia, empyema, and meningitis.

Multiple 500-mg. doses of the drug have been useful in gonorrhea and syphilis. Since penicillin is the drug of choice for the treatment of syphilis and gonorrhea, erythromycin estolate should be employed for these infections only in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients known to be hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

Side-Effects: Data obtained from seven years' use of propionyl erythromycin ester and erythromycin estolate (Ilosone) indicate that hepatic dysfunction with or without clinical jaundice may occur during or following courses of therapy with the drug.

Changes in liver function tests in such cases have been indicative of intrahepatic cholestasis. The symptoms appear to be the result of a form of sensitization. The initial symptoms have appeared in some cases after a few days of treatment but generally have followed one or two weeks of continuous therapy or several courses of the drug. Symptoms reappear promptly if the drug is readministered to sensitive patients, usually within forty-eight hours. Eosinophilia was noted in peripheral blood counts. The findings readily subsided without apparent residual effects when treatment was discontinued. Recovery was delayed in one reported instance. The physician indicated in this case that either drug-induced jaundice or viral hepatitis may have been responsible for the findings.

In one clinical study involving ninety-three patients treated with the antibiotic, three cases of jaundice were observed and an additional eleven cases developed some changes in liver function tests. Three of the patients had abnormal liver function tests a second time on readministration of the drug.

Even though it is assumed that not all cases of jaundice have been reported, it seems clear that the number is small compared with the amount of drug that has been used. Reported cases have included persons in whom there had been administered other drugs known to be associated at times with hepatic side-effects and cases in which the presence of viral hepatitis or other disease may have been responsible for the findings. In some of the cases, associated gastro-intestinal symptoms simulated the colic of biliary tract disease. In other instances, clinical symptoms and results of liver function tests resembled findings in extrahepatic obstructive jaundice. It appears that the occurrence of jaundice after administration of Ilosone is infrequent, but further investigations are being made to estimate its incidence more accurately.

In those cases mentioned above in which jaundice appeared to be definitely related to use of the drug, laboratory findings we characterized by increased direct-reacting bilirubin, elevat alkaline phosphatase levels, negative or weakly positive cepha flocculation and thymol turbidity tests, elevated serum glutan oxalacetic transaminase levels, peripheral eosinophilia, and n mal cholecystograms.

Individual idiosyncrasy seems evident since jaundice has n been reported in other patients taking prolonged courses of t medication. Patients with chronic infection have been given 1 to 2 Gm. of the drug daily for periods of two to six months, a patients with rheumatic fever have taken prophylactic doses 0.5 Gm. daily for two years without difficulty. In one group 144 patients who received the drug daily for two years, no jau dice was noted. It was of interest that members of six of the patients' families, who were not taking the drug, had episod of jaundice during the study period.

Transaminase and serum alkaline phosphatase levels we determined in a group of fifty-four adults and children who to 250 mg. of Ilosone daily for an average of sixteen months rheumatic fever prophylaxis. The results were compared wi those of a similar group of forty-four patients who received pe icillin. There were no cases of jaundice in either group. Elevati of SGPT and serum alkaline phosphatase levels during the cou of treatment was observed in one patient treated with Ilosо and in two patients treated with penicillin. Seven other patie in the group receiving Ilosone and four others in the penicil group showed elevations in one of the tests at some time duri administration of the drugs.

Very satisfactory therapeutic results, without toxicity, w reported in 102 pediatric patients who received short-term (t day) courses of Ilosone in the treatment of streptococcus inf tions. Results of liver function tests in these patients were co parable to those in a similar control group who had receiv penicillin.

Gastro-intestinal disturbances not associated with hepatic e fects are observed in a small proportion of individuals as a res of a local stimulating effect of the medication on the alimenta tract; however, the normal intestinal gram-negative bacter flora is not appreciably altered by erythromycin drugs.

Although allergic manifestations are uncommon with the u of erythromycin, there have been occasional reports of urticar skin eruptions, and, on rare occasions, anaphylaxis.

Administration and Dosage: Ilosone is administered orally.

Ilosone Pulvules®
Ilosone Chewable Tablets
Ilosone Drops
Ilosone, 125, for Oral Suspension

For infants and for children under twenty-five pounds of bo weight, the usual dosage is 5 mg. per pound every six hours; f children twenty-five to fifty pounds, 125 mg. every six hou (Tablets Ilosone Chewable should be chewed or crushed a swallowed with water.)

For adults and for children over fifty pounds, the usual dosa of Ilosone is 250 mg. every six hours.

For severe infections, these dosages may be doubled.

When larger doses are indicated, parenteral erythromyc therapy should be considered.

In the treatment of syphilis, the recommended total dosage 20 to 30 Gm. given in divided doses for a period of ten to fifte days. Close follow-up of the patient is necessary since erythr mycin drugs have not had adequate evaluation in all stages syphilis. Examinations of spinal fluid are recommended as pa of the follow-up therapy.

For gonorrhea, 500 mg. four times a day for four days a recommended. In the treatment of gonorrhea, patients with suspected lesion of syphilis should have a dark-field examinati before receiving antibiotics, and monthly serologic tests shou be made for a period of three months.

How Supplied: Pulvules Ilosone, Capsules, N.F., 125 and 250 m (equivalent to base), in bottles of 24 and 100.

Tablets Ilosone Chewable, N.F., 125 mg. (equivalent to base in bottles of 50.

Ilosone Drops, 5 mg. (equivalent to base) per drop, in 10-c size packages, with dropper calibrated at 25 and 50 mg.

Ilosone, 125, for Oral Suspension, N.F., 125 mg. (equivale to base) per 5-cc. teaspoonful, in 60 and 150-cc.-size package

REHABILITATION Notes

REHABILITATION SECTION
BALTIMORE CITY MEDICAL SOCIETY,

DOUGLAS G. CARROLL M.D.
EDITOR

Return of Upper Extremity Function in Hemiplegia

DOUGLAS G. CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

In previous communications, a method of testing significant function of a single upper extremity was described[1] and the findings in patients with hemiplegia were reported.[2] The present communication is concerned with serial changes in hand function over a six-month period in patients with hemiplegia.

Material and Methods

Between June 12, 1964, and June 14, 1965, 79 patients with localized cerebrovascular disease were seen in the Department of Physical Medicine and Rehabilitation at the Baltimore City Hospitals. For purposes of this study, 48 were selected on the basis of three criteria: (1) they had to have weakness of the arm and leg typical of hemiplegia; (2) the stroke had to have occurred within four months of their being first seen in the department; and (3) they had to be able to follow directions sufficiently well to perform the upper extremity test.[1, 2]

Activities of Daily Living (ADL) tests, Mental Status Check List (MSCL) scoring,[3, 4] and the Upper Extremity Function Test (UEFT) were performed on these patients. The UEFT has ben modified since the previous reports.[1, 2]

Results

Ten of the 48 patients had significant UEFT scores when first seen. Four of these had some associated speech defect at onset, but none was comatose when first seen. None had ADL scores of less than 13 when first studied. Only one patient died. The majority showed quite significant increases in ADL scores. All except one (in addition to the patient who died) showed improvement in UEFT score. Heart disease was present in only two patients.

The remaining 38 patients scored 0 on the initial UEFT. In the Table, these patients are listed in order of decreasing ADL scores,[3] and the important associated factors for each are charted. Reservations as to the exact pathological diagnosis have been commented on previously,[2] and the probable cause of the cerebral infarction is a clinical impression. The large majority of patients were thought to have had cerebrovascular thrombosis. Eighteen of the patients had some type of speech difficulty at the onset of the hemiplegia. Six were comatose on admission. All patients had suffered the hemiplegia less than 16 weeks prior to the first study. Duration of follow-up varied from two days to a year. Twelve patients died within the first six months. A number of patients showed improvement in the ADL scores, but only three showed improvement in the UEFT scores. A large number of patients had associated hypertension and arteriosclerotic heart

INITIAL FINDINGS ON 38 PATIENTS WITH HEMIPLEGIA OF LESS THAN 16 WEEKS DURATION WHO HAD AN INITIAL UEFT SCORE OF ZERO

(PATIENTS ARE LISTED IN ORDER OF DECREASING ADL SCORE)

AF = Atrial Fibrillation; ASHD = Arteriosclerotic Heart Disease; PVI = Peripheral Vascular Insufficiency

disease. Rheumatic heart disease with valvular involvement was present in two patients who were thought to have had cerebral emboli.

Examination of the Table suggests that the patients who had significant hand function when first seen were, in general, better off in total function, had fewer associated diseases, and were far more likely to show improvement in their hand function than those who had no hand function.

Further study reveals the factors which might be important in predicting which patients would improve and which would not. Most of the patients who did not improve had a zero UEFT score when first seen. Most of those who improved had some UEFT score when first seen. Moreover, those who did improve, improved greatly—reaching almost normal values. The pattern of return of function is first in grasp and pinch between the index finger and thumb. Next, function gradually returns in the fingers ulnarward to the index finger. Strength of pinch and strength of grasp tend to improve concomitantly with return in overall function.

Discussion

The pattern of recovery in hemiplegia has been described by several observers. Twitchell's report[5] is directed primarily toward neurophysiological changes. Van Buskirk[6] deals with the learning of simple tapping tasks with the hemiplegic hand during recovery. A third report[7] is concerned with recovery of motion at the joints. The present report is concerned with return of activity or function significant in the performance of daily activities.

The assumption has been made that there are certain basic function patterns of upper extremity activity that, when combined, account for most of the complex behavior available to the hand. In addition to the gross movements about the shoulder, flexion and extension of the elbow, and pronation and supination, the finer movements of the fingers can be reduced to several basic activity patterns. These hand and finger patterns are "grasp," "grip," "lateral prehension," and "pinch." To increase precision, description and scoring, these basic activities are defined in terms of the testing procedure.

About one-quarter of the patients with hemiplegia who met the criteria for inclusion in this study showed improvement in hand function during the time of follow-up. A prediction of this result can be made with a fair degree of accuracy within the first several weeks following the hemiplegia. The only patients with a zero UEFT score who showed improvement in function were seen within nine days of the onset of the hemiplegia (see Table). No patient who had been hemiplegic for more than nine days and who had a zero UEFT score showed improvement.

These findings agree with those of Bard and Hirschberg,[7] who noted that all patients who recovered full hand motion had some initial motion in the first month.

Summary

Forty-eight patients who had localized cerebrovascular disease with hemiplegia were seen in a Department of Physical Medicine and Rehabilitation within sixteen weeks of the onset. They were studied serially with a standardized upper extremity function test to ascertain the severity of impairment and degree of recovery. About a quarter of these patients showed improvement in hand function. Of the thirty-eight patients with no significant score on the test when first seen, only three recovered significant function. Of ten patients who had partial scores, only two (one of whom died) suffered deterioration during the period of follow-up. It is concluded that unless there is some evidence of hand movement and function within the first two weeks following a cerebrovascular accident with hemiplegia, it is quite unlikely that there will be return of significant function in the upper extremity. If there is beginning return of function within two weeks, it is likely that the improvement will continue.

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

AMA · 116th Annual Convention · Atlantic City, New Jersey · June 18-22, 1967

Come to Atlantic City—one of America's favorite by-the-sea playgrounds—and join your colleagues at the AMA's 116th ANNUAL CONVENTION!

Fine hotels and motels, excellent restaurants, plus all the advantages of a lively resort make this year's Convention a must for you and your family. Atlantic City provides a superb setting for a summer classroom and all the latest techniques of modern medicine. Plan to be one of the participants in this rewarding four day postgraduate education program.

• Four general scientific sessions • 23 section programs • 575 scientific and industrial exhibits. Lectures, panel discussions, motion pictures, and color television. Plan to attend—continue your postgraduate education.

RESERVE NOW for the SCIENTIFIC AWARDS DINNER in honor of the Scientific Award Winners—Wednesday, June 21, 1967. Since space is limited, we suggest you make your reservations before June 1, 1967. Tickets are $10.00 each, payable in advance.

See JAMA May 8, 1967 for complete scientific program—forms for advance registration and hotel accommodations.

AMA BYLAWS

Chapter VI. Meetings-Section 2. Registration (A) Members. A Member's Section registration shall correspond with his specialty or General Practice status as designated by him for classification in the American Medical Association Directory. To be accepted for Section registration purposes, a member of a Section who desires to change his registration from one Section to another because of a change in his specialty, shall be required to inform the Headquarters of The American Medical Association by written notice of this intention at least sixty days in advance of the Annual Convention.

Chapter VII. Sections-Section 7. Participation in Business Only *active members* registered in accordance with Chapter VI, Section 2 (A) shall have the right to participate in the *business deliberation* of a section.

American Medical Association 116th Annual Convention · Convention Hall ·

June 18-22, 1967 Atlantic City

PLEASE NOTE

An Active physician member may not change *his Section* registration for voting purposes from one Section to another Section, unless written notice of a change in his specialty has been given the AMA Headquarters at least 60 days (by April 18, 1967) in advance of the opening day of the Annual Convention.

Upon completion of an Active Member's Registration at the AMA Registration Desk, members will not be permitted to switch from one Section registration to another Section registration during the entire period that the AMA Annual Convention is in session.

However, all members are encouraged to attend any and all of the Scientific Section programs. Such attendance has no direct connection with the Section in which an Active Member may wish to be qualified to vote.

PLEASE RETURN TO: Circulation and Records Dept.

Elijah Saunders, MD—Editor

Coronary Care Units: Part II

LEONARD SCHERLIS, MD
Head, Division of Cardiology
JERRY SALAN, MD
Director, Coronary Care Unit
University of Maryland Hospital and School of Medicine

The constant electrocardiographic monitoring of patients who have sustained myocardial infarction has revealed that significant arrhythmias occur in 75%-80% of these patients. In one report, the incidence of premature ventricular beats was approximately 70%, ventricular tachycardia 28%, bradycardia 15%, heart block 5%, ventricular fibrillation 7.5%, and ventricular standstill 4.4%. Arrhythmias were responsible for 47% of 171 deaths in one series.

The results of intensive care for patients with myocardial infarction are now becoming available in significant numbers. In a recent summary of data obtained by the Coronary Heart Disease Section of the Heart Disease Control Branch of the US Public Health Service, it was reported that, of 1,528 patients treated in coronary care units for myocardial infarction, 180 developed cardiac arrest for a frequency of 11.8%. Fifty-nine, or 32.8%, of these arrest victims survived their hospital stay. Only the prompt recognition and treatment of cardiac arrest achieved these results. There has been little evidence, however, that any significant reduction in the number of deaths from shock has been achieved. The careful observation of patients in a coronary care unit has resulted in the philosophy that ventricular fibrillation and standstill are often preventable. It has been observed that frequent premature beats usually precede ventricular fibrillation and should be treated immediately. In the presence of myocardial infarction, ventricular ectopic beats may provoke ventricular fibrillation or ventricular tachycardia. The control of ventricular ectopic beats is therefore of fundamental importance in preventing these arrhythmias, particularly if they are frequent or occur from several foci or occur in runs. The results of prompt treatment of such arrhythmias in a coronary care unit can be most dramatic. Lown has reported only one episode of ventricular fibrillation in 201 consecutive patients with myocardial infarction. There were 26 deaths in the coronary care unit in this series. Two patients died with heart block, giving an incidence of electrical fatalities of 1.5%.

In the short history of coronary care units, certain trends are discernible. The prompt treatment of lesser arrhythmias, the earlier use of intravenous pacemakers, and the earlier diagnosis and specific treatment for failure have all changed the emphasis in a coronary care unit from the

prompt use of cardiopulmonary resuscitation measures to the prevention of cardiac arrest. The occurrence of primary cardiac arrest has been less frequent as emphasis has been placed on these preventive and earlier therapeutic measures. All patients with suspected myocardial infarction should be placed in the coronary care unit and this is especially true of the so-called "good risk" patients all of whom are still susceptible to the occurrence of sudden arrhythmias.

The major problem in establishing a coronary care unit is the availability of well trained nurses to staff the unit. There are approximately 1,200 hospitals that have 200 or more beds. It is estimated that if each of these established a five-bed coronary care unit, training would be needed for more than 14,000 professional nurses as a base figure. Similarly, 9,300 vocational or practical nurses would be required. In the 4,600 hospitals with less than 200 beds, additional trained personnel would be needed to care for patients with acute myocardial infarction in adequate care areas. As the Coronary Heart Disease Section of the Heart Disease Control Branch of the Public Health Service has stated, "Training is the most urgent need for the continued development of coronary care units in America today."

The relative roles of the nurse and of the physician will differ from unit to unit depending in part upon the availability of house staff and the training of the nurses. In some units, the nurses are able to recognize specific arrhythmias and to institute emergency measures as previously outlined by the patient's physician. This includes cardiopulmonary resuscitation, defribrillation, and the indicated medications. Where physicians are constantly on duty, the nurse will have less responsibility, but should still be taught the measures necessary in all emergencies.

It has been generally recommended that a hospital have at least 200 general care beds or 100 persons admitted per year with a diagnosis of definite or suspected myocardial infarction before having a coronary care unit. A five-bed unit with an average patient stay of seven days can accommodate approximately 200 myocardial infarction patients a year, allowing for an 80% occupancy rate.

The results of all of this planning and training should have prompt effect in reducing the mortality from myocardial infarction. However, any consideration of effective measures in reducing the mortality from arteriosclerotic heart disease must recognize that the coronary care concept, as important as it is, is only one approach to the general problem of reducing the mortality from arteriosclerotic heart disease. It is anticipated that further significant reductions can be made by the better and earlier diagnosis of arteriosclerotic heart disease, prompt hospitalization of patients suspected of acute myocardial infarction, effective cardiopulmonary resuscitation programs both inside and outside of the hospital, and—above all—primary preventive programs.

OPENS ASTHMATIC AIRWAYS—

AND KEEPS THEM OPEN

NUMA® DURA-TABS®

for *prolonged* aid to ventilation

Each Numa Dura-Tab provides:

theophylline	225 mg.
ephedrine HCl	50 mg.
butabarbital	25 mg.

(Warning: butabarbital may be habit-forming.)

Numa Dura-Tabs provide *prolonged* three-way action to ease breathing. Theophylline, a potent bronchodilator with minimal effect on the CNS, opens air passages and reduces bronchial spasm. Ephedrine HCl improves breathing capacity through its decongestant action. Butabarbital, a mild sedative, allays fear and apprehension.

Dosage: One Numa Dura-Tab every 8 to 12 hours helps keep the asthmatic patient symptom-free all day/all night.

Precautions: Use with caution in cardiovascular or hyperthyroid disease, severe hypertension, circulatory collapse, prostatic hypertrophy, or glaucoma.

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, *Commissioner*

HIGHLIGHTS

ROBERT HICKMAN RILEY, MD, DrPH

With the passing of Robert H. Riley, MD on January 25, Maryland lost a dedicated servant, famed for his contributions to public health both here and throughout the nation.

Director of the Department for 27 years, Dr. Riley's career in Maryland began in 1914 when, having received his MD and BS degrees from the University of Oklahoma, he came to Baltimore for graduate study in bacteriology and pathology at The Johns Hopkins University School of Medicine.

William H. Welch, MD, then president of the State Board of Health, soon persuaded the young scientist of the need for dedicated physicians in the public health field. His appointment as Deputy State Health Officer began a career which was to have far-reaching effects.

His assumption of the directorship of the State Health Department in 1928 coincided with his appointment to the faculty of The Johns Hopkins School of Hygiene and Public Health, where, in 1922, he had received a degree of doctor of public health.

Under Dr. Riley's leadership, Maryland gradually moved out of the "Dark Ages as far as public health was concerned" to become the first state to have a strong, locally based public health unit in each county. It also became the first state to establish a medical care program for the indigent, and one of the first to develop an extensive program for the chronically ill.

Although deprecating his own contributions, Dr. Riley felt great satisfaction as the ravages of communicable disease lessened year by year under control measures that were initiated and expanded during his tenure.

Receiving in 1953 the Arthur T. McCormick Award of the National State and Territorial Health Officers Association, Dr. Riley heard himself described as "a guide for health officers throughout the country in planning the organization and administration of medical services which have strengthened the total program of public health."

This was the man who had been born in 1880 in a log cabin near Ripley, West Virginia.

UNIVERSITY CARDIAC CLINIC RECEIVES SUPPORT

Through a contract with the University of Maryland Hospital, the Health Department has agreed to provide $50,000 annually to support the adult cardiac clinic. Diagnostic work-up, evaluation, and follow-up management will be provided on an outpatient basis, with the object of conserving hospital beds for care rather than diagnosis. The clinic will provide consultation to local health departments, advise other medical institutions on establishment of cardiac clinics, and help train personnel. The funds being used are Federal formula grant funds.

"END MEASLES" CAMPAIGN IN ST. MARY'S COUNTY

A high intensity measles vaccination campaign was carried on in St. Mary's County on February 12. Co-sponsored by the county health department

and Medical Society, with aid from the Department's Division of Communicable Diseases, two clinics were manned by county physicians, health department personnel, and community volunteers. Susceptible children between one and twelve years received a shot of Schwarz strain measles vaccine, the cost of which was partially borne by Federal Vaccination Project funds. Parents were encouraged to make a donation to help defray costs.

PARASITOLOGY COURSE COMPLETED BY MARYLANDERS

Ten Maryland laboratory scientists, eight from the Department's Bureau of Laboratories and two from the US Public Health Service, recently successfully completed a one-year course in blood parasitology, complementing a similar course in intestinal parasitology the previous year. In all, 78 students from 35 states finished the course, which was offered by the Communicable Disease Center.

In fiscal year 1966, the State laboratories examined 6,013 specimens for intestinal parasites and 135 for blood parasites.

WEEKLY SEMINARS HELD AT BUREAU OF LABORATORIES

A series of weekly staff seminars has been inaugurated by the Bureau of Laboratories. The one-hour seminars will provide in-service instruction for Bureau and branch laboratory personnel and are open to other interested persons. Responsibility for programs rotates through the divisions —administrative, biochemistry, certification and field services, clinical laboratory services, environmental chemistry, microbiology, and virology.

UP TO 10–12 HOURS' CLEAR BREATHING ON ONE TABLET

Dimetapp® Extentabs®

(Dimetane® [brompheniramine maleate], 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.)

sinusitis, colds, or U.R.I., metapp lets congested patients eathe easy again. Each Extentab ings welcome relief all day or all night, ually without drowsiness or over- imulation. Its key to success? The metapp formula—Dimetane (brom- eniramine maleate), a potent anti- stamine reported in one study to have icited side effects as few as the placebo,* amed with decongestants phenyl- hrine and phenylpropanolamine—a dependable 10- to 12-hour form.

iller, I. W., and Lowell, F. C.: New England Med. 261:478, 1959.

Contraindications: Patients hypersensitive to antihistamines. Not recommended for use during pregnancy.

Precautions: Until the patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.

Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability, or excitement may be encountered.

Dosage: 1 Extentab morning and evening, or as needed.

Supplied: Bottles of 100 and 500.

Also available: Dimetapp® Elixir for conventional *t.i.d.* or *q.i.d.* dosage. See package insert for further details.

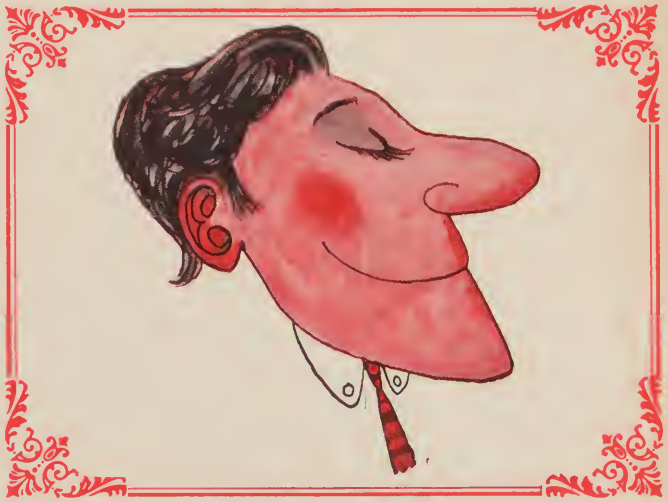
The Proof of Excellence is in the Performance



for noses of every description, one safe and sure prescription:

Otrivin®

(xylometazoline CIBA)
on Rx only

■ quickly relieves congested nose
■ action is gentle, yet prolonged
■ side effects are minimal

INDICATION: Nasal congestion. CONTRAINDICATION: Do not use in patients sensitive to small doses of sympathomimetic substances. WARNINGS: Prolonged or excessive use may cause rebound congestion. Use cautiously in patients with hyperthyroidism, coronary artery disease, hypertension, and diabetes. CAUTION: Do not shake Nasal Spray. Rinse Nasal Solution dropper or Nasal Spray tip in hot water after each use. No more than one person should use the same dropper bottle or nasal spray.
SIDE EFFECTS: Occasional local reactions: rebound congestion, slight burning or stinging, sneezing, dry nose. Occasional systemic effects: headache, drowsiness, lightheadedness, insomnia, palpitations. Overdosage in young children may produce profound sedation.
DOSAGE: **Adults:** *Nasal Solution*—2 or 3 drops in each nostril every 4 to 6 hours. *Nasal Spray*—Squeeze rapidly once or twice in each nostril every 4 to 6 hours. **Children under 12:** *Pediatric Nasal Solution*—in infants under 6 months. *Pediatric Nasal Spray*—Squeeze rapidly once in each nostril holding tube upright; repeat every 4 hours as necessary. SUPPLIED: OTRIVIN® hydrochloride (xylometazoline hydrochloride CIBA) *Nasal Solution,* 0.1%; dropper bottles of 1 fluidounce, bottles of 1 pint. *Nasal Spray,* 0.1%; plastic squeeze tubes of 15 ml. *Pediatric Nasal Solution,* 0.05%; dropper bottles of 1 fluidounce. *Pediatric Nasal Spray,* 0.05%; plastic squeeze tubes of 15 ml. *Nasal Solutions* contain either 0.1% or 0.05% xylometazoline hydrochloride, triethanolamine, hydrochloric acid, sodium chloride, and phenylmercuric acetate 1:50,000 as preservative in water. *Nasal Sprays* contain either 0.1% or 0.05% xylometazoline hydrochloride, potassium phosphate monobasic, potassium chloride, sodium phosphate dibasic, sodium chloride, and benzalkonium chloride 1:5000 as preservative in water. *Consult complete literature before prescribing.*

CIBA

Do your patients
shell out too much
for a diuretic?

The answer may be yes... if they're not on Hygroton. For instance, a therapeutic dose of a short-acting diuretic may cost 3 times as much as an equivalent dose of Hygroton. With Hygroton, in fact, you can usually do the job with just one tablet a day or one every other day. It's no wonder that the trend has been away from short-acting, multiple-dose, high-cost diuretics.

You may hear that a short-acting diuretic was more effective in a 400 mg. (ten-tablet) dose than Hygroton in a 200 mg. (two-tablet) dose.

If one considers maximum recommended doses for each product, tablet for tablet Hygroton was clearly superior. Two tablets of Hygroton were found to produce almost 40% more natruresis and 20% more weight loss than five tablets of the other diuretic.* Note that these are maximum recommended doses!

For effectiveness, economy, and convenience, therefore, Hygroton is the diuretic to choose to start with and the one to stay with.

*Brest, A. N., et al.: J. New Drugs 5:329, 1965.

Natruresis above control values after maximum recommended doses (mEq./24 hours) in "normal" patients

111	152
5 tablets short-acting nonthiazide diuretic	2 tablets Hygroton

48-hour weight loss after maximum recommended doses in edematous patients with congestive heart failure due to arteriosclerotic or rheumatic heart disease

1.84 lbs.	2.2 lbs.
5 tablets short-acting nonthiazide diuretic	2 tablets Hygroton

Indications: Hypertension and many types of edema involving retention of salt and water.
Contraindications: Hypersensitivity and most cases of severe renal or hepatic disease.
Warning: With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind.
Precautions: Reduce dosage of concomitant antihypertensive agents by at least one-half. Discontinue if the BUN rises or liver dysfunction is aggravated. Electrolyte imbalance and potassium depletion may occur; take special care in cirrhosis or severe ischemic heart disease, and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended.
Side Effects: Dizziness, weakness, nausea, vomiting, hyperglycemia, hyperuricemia, headache, muscle cramps, postural hypotension, constipation, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin reactions, including urticaria and purpura, epigastric pain, or G.I. symptoms after prolonged administration.
Average Dosage: One tablet (100 mg.) with breakfast daily or every other day.
Availability: Tablets of 100 mg. in bottles of 100 and 1000. For full details, see the complete prescribing information.

Report on Drunkenness Offenders at City Jail

The Second Annual Report on the Drunkenness Population at the Baltimore City Jail indicates a noticeable decrease in drunkenness offenders incarcerated at the City Jail during 1966 as compared with the last four months of 1965, reported in the first study. The first report covered the period from September 1965 through December of 1965. The current report is for the calendar year 1966.

A comparison of these two studies shows that for the four months of the first study there were 34,178 jail days served by 1,788 inmates. This is contrasted with a total of 57,636 jail days served by 1,970 in all of 1966.

This decline in the "Drunkenness Population" may be attributed to either or both of the following reasons:

1. More alcoholics are seeking treatment in the several State hospital Alcoholic Rehabilitation Units, through AA, in the City Health Department's Alcoholism Clinic, in Half-way Houses, or in the Municipal Court Probation Alcoholic Rehabilitation Unit.
2. Fewer arrests for *public intoxication alone* are being made. As noted previously, many persons with a drinking problem are charged with Disorderly Conduct or Disturbing the Peace.

There is still a hard core group of "revolving door alcoholics." Of the 1,970 persons in jail during 1966 for public drunkenness, 374 of them were repeaters.

The *Report* was prepared by Mr. Harry E. Shelley, Coordinator of Alcoholism Programs in the Baltimore City Health Department. Physicians who desire assistance in dealing with alcoholic patients may get in touch with Mr. Shelley by calling 752-2000, Extension 842.

Clinton L. Ewing Retires

Effective March 15, Mr. Clinton L. Ewing retired from his position as Director of the Bureau of Laboratories, a post he has held since 1933.

Mr. Ewing has served the Baltimore City Health Department and the people of Baltimore a full fifty years. Beginning in 1915 as a laboratory worker, he successively climbed the administrative ladder from assistant bacteriologist in 1917 to Director of the Bureau of Bacteriology in 1930 to Director of the Bureau of Laboratories in 1933.

Through the years he has been a visiting instructor of medical students at The Johns Hopkins University and University of Maryland medical institutions and has provided many services for the physicians and hospitals in the city. Under his guidance the Bureau of Laboratories of the Baltimore City Health Department has achieved national recognition for many innovations related to public health laboratory work, including the environmental bacteriology and chemistry of milk, food, water and air, and the control of infectious diseases.

Department of Mental Hygiene

Isadore Tuerk, MD, Commissioner

Kurt Gorwitz, Statistics Director

A Midyear Report

A total of 17,112 patients were treated in Maryland's six psychiatric hospitals during the first half of the current fiscal year. The increase of 2,876 or 20.2%, during the past five years represents a continuation of a long range upward trend. In 1962, one out of every 182 Maryland residents was under care; in the current fiscal year this figure is estimated to be one out of every 158.

This steady growth has been due mainly to the rapid patient turnover resulting from the growing number of admissions for short term intensive treatment of acute non-psychotic disturbances. As indicated in the following table, both admissions and discharges increased substantially between 1962 and 1967. At the same time, the average size of the hospital population has decreased slightly.

First Six Months of Fiscal Year	Average Size of Hospital Population	Total Patients Treated	Admissions	Discharges
1962	8,297	14,236	2,877	2,443
1967	8,010	17,112	5,305	4,946
Net Change	—287	2,876	2,428	2,503
Percent Change	—3.5%	+20.2%	+84.4%	+102.5%

The median length of hospitalization of newly admitted patients is now less than three months, and nine out of ten return to the community within one year. Only five percent remain under hospital care after two years. This has meant that there is now only a very moderate buildup in the number of patients hospitalized continuously for extended time periods. As former long term patients die or are released, they are replaced by a smaller number of new chronic cases. The net effect of this has been that:

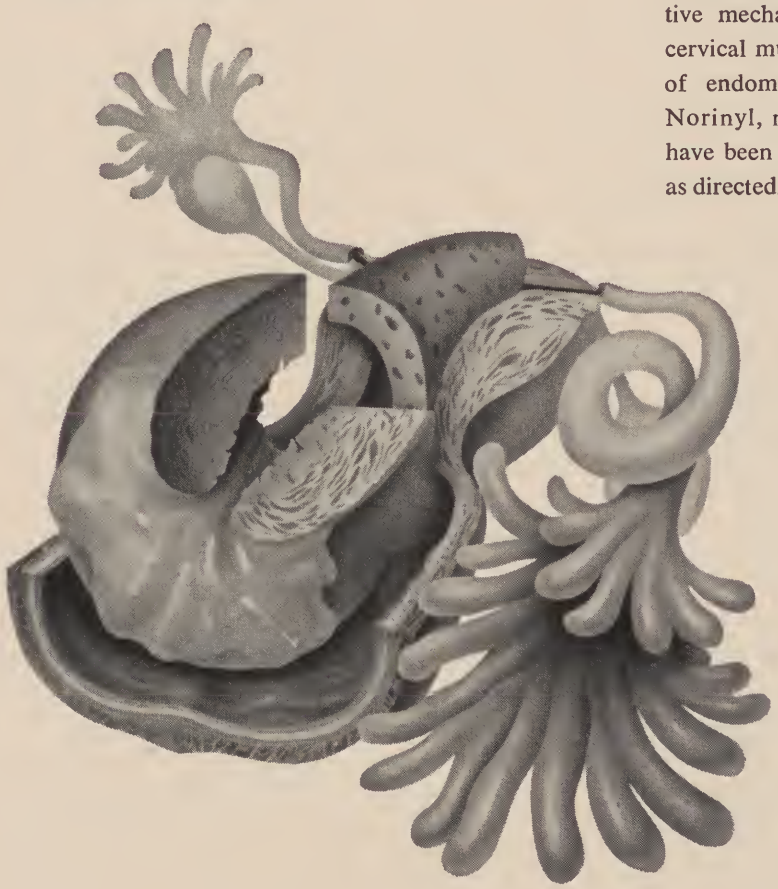
1. The proportion of beds occupied by long term patients with chronic psychotic illnesses is decreasing while the proportion occupied by short term patients with acute psychotic and non-psychotic disturbances is rising.

2. The average period of hospitalization of newly admitted patients is going down and is now very much shorter than a few years ago. At the same time, the majority of released patients are not re-hospitalized and this proportion does not appear to be changing.

3. The average size of the hospital population is declining at the same time that the total number of patients treated is increasing. During the 1962 fiscal year there was a ratio of 2.1 patients treated for every hospital bed; in the current fiscal year this is estimated to be 2.8

The above factors have important implications. One of these is that the development of community centered programs has not as yet reduced the flow of admissions to the state hospital. Further expansion and co-ordination of alternatives to hospitalization in a state operated facility are therefore essential. It should be clear also that patient-staff ratios applicable to a custodial hospital population are not applicable to a patient population undergoing a rapid turnover. Continuing re-evaluation and reassessment of needs are therefore indicated if adequate service levels are to be maintained.

Norinyl® tablets



(norethindrone 2 mg. & mestranol 0.1 mg.)

for multiple contraceptive action that has produced a record of unexcelled effectiveness

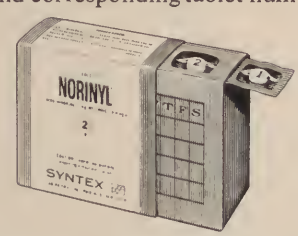
inhibition of ovulation by means of 2 time-proved hormonal agents

production of a cervical mucus hostile to sperm motility and vitality

creation of an endometrium unreceptive to egg implantation

no unplanned pregnancies

Norinyl provides multiple action for maximum assurance of success. It does not depend on ovulation inhibition alone for contraceptive effectiveness. The mechanism of action of combined hormonal therapy results in ovulation inhibition reinforced by other protective mechanisms, including a hostile cervical mucus[1-13] and an acceleration of endometrial changes.[1-3,7-16] With Norinyl, no unplanned pregnancies have been reported to date when used as directed.



plus important supportive benefits that help her through those critical early months of oral contraception

low incidence of side effects

Low incidence of BTB and spotting, nausea and amenorrhea tends to minimize side effect problems and increases patient cooperation.

no confusion about dosage

An unbreakable "confusionproof" package makes it easy to adhere to prescribed dosage schedule: individually sealed tablets numbered from 1 through 20 *plus* monthly calendar record enables patient to double-check dosage intake by day and corresponding tablet number.

Contraindications: Thrombophlebitis or pulmonary embolism (current or past). Existing evidence does not support a causal relationship between use of Norinyl and development of thromboembolism. While a study which was conducted does not resolve definitively the possible etiologic relationship between progestational agents and intravascular clotting, it tends to confirm the findings of the Ad Hoc Advisory Committee appointed by the Food and Drug Administration to review this possibility. Cardiac, renal or hepatic dysfunction. Carcinoma of the breast or genital tract. Patients with a history of psychic depression should be carefully studied and the drug discontinued if depression recurs to marked degree. Patients with a history of cerebral vascular accident.

Warning: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn.

Precautions: By May 1963, experience with norethindrone 2 mg.—mestranol 0.1 mg. had extended over 24 months. Through miscalculation, omission or error in taking the recommended dosage of Norinyl, pregnancy may result. If regular menses fail to appear and treatment schedule has not been adhered to, or if patient misses two menstrual periods, possibility of pregnancy should be resolved before resuming Norinyl. If pregnancy is established, Norinyl should be discontinued during period of gestation since virilization of the female fetus has been reported with oral use of progestational agents or estrogen. When lactation is desired, withhold Norinyl until nursing needs are established. Existing uterine fibroids may increase in size. In metabolic or endocrine disorders, careful clinical preevaluation is indicated. A few patients without evidence of hyperthyroidism had elevated serum protein-bound iodine levels, which in the light of present knowledge, does not necessarily imply hyperthyroidism. Protein-bound iodine increased following estrogen administration. Bromsulphalein retention has occurred in up to 25% of patients without evidence of hepatic dysfunction. Studies from 24-hour urine collections have shown an increase in aldosterone and 17-ketosteroids and decrease in 17-hydroxycorticoid levels. Thus, Norinyl should be discontinued prior to and during thyroid, liver or adrenal function tests. Because progestational agents may cause fluid retention, conditions such as epilepsy, migraine and asthma require careful observation. Thus far no deleterious effect on pituitary, ovarian or adrenal function has been noted; however, long-range possible effect on these and other organs must await more prolonged observation. Norinyl should be used with caution in patients with bone, renal or any disease involving calcium or phosphorus metabolism.

Side Effects: Intermenstrual bleeding; amenorrhea; symptoms resembling early pregnancy, such as nausea, breast engorgement or enlargement, chloasma and minor degree of fluid retention (if these should occur and patient has not strictly adhered to medication plan, she should be tested for pregnancy); weight gain; subjective complaints such as headache, dizziness, nervousness, irritability; in a few patients libido was increased. In a total of 3,090 patients, 2.2% discontinued medication because of nausea.

NOTE: See sections on contraindications and precautions for possible side effects on other organ systems.

Dosage and Administration: One Norinyl tablet orally for 20 days, commencing on day 5 through and including day 24 of the menstrual cycle. (Day 1 is the first day of menstrual bleeding.)

Availability: Dispensers of 20 and 60 tablets; bottles of 100.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

Solutions to Business Problems in Daily Medical Practice

Telephone Techniques: Part II

WILBUR L. McCLURE, JR.

Just in case you missed last month's column, it concentrated on techniques for handling "incoming" calls. The following continues the subject and concentrates on handling "outgoing" calls.

Outgoing calls to patients: "Get Betty Hernandez, please." You are referring to a patient who called prior to your arrival in the office or to a patient you must call regarding a lab report received after her last visit.

If your aide did not make a note of Mrs. Hernandez's number on the phone memo, how rapidly can she obtain it?

Once the aide has the patient on the phone, how well prepared are you to discuss and prepare notes about her case?

Acceptable answers might be as follows:

Each patient's phone number is recorded on the accounts receivable and in the office phone directory and in a conspicuous space in the medical history file. (All such phone numbers are also recorded on incoming phone memos and listed beside each patient's name on the appointment log in case it should become necessary to cancel office hours.)

Prior to lifting the receiver, the patient's medical history file is placed on my desk for review and insertion of notes. Important matters such as these are not trusted to memory or scratched on prescription pads for recording later.

Outgoing calls of a special nature: "Get the O.R. nurse at St. Agnes right away, please," or the executive secretary of the medical society, a pharmacy, an equipment supplier, a referring doctor, a laboratory, etc.

Each doctor and his aides have long lists of important numbers. The trick is to keep such a list current and available.

A few offices choose to maintain a separate telephone directory: one for patients and one for all other numbers. This is by far the best system. Generally speaking, it makes for a less cumbersome directory; and besides, if one directory is lost, all is not lost.

Outgoing calls of a personal nature: "Get my wife on the phone, please," or your stock broker, insurance representative, accountant, relative, and, in some rare cases, friends such as golf partners, club stewards, non-practice associated colleagues, etc.

The best policy here is to maintain a third directory on your desk even though an aide might have the responsibility of keeping it up-to-date.

When time permits, place all personal calls yourself. You will probably make contact much faster; furthermore, it is best to let your aide perform professional tasks.

This article and Part I should become a part of your office S.O.P. manual. Remember: That which you reduce to writing is not easily ignored or forgotten.

Mr. McClure is director of the Baltimore office of Professional Business Management, Inc. This monthly column is prepared as a complimentary service to the *Maryland State Medical Journal.*

FEBRUARY, 1967 MRS. HARRY L. BERMAN, *Editor*

Annual Meeting of the Woman's Auxiliary to the Medical and Chirurgical Faculty of Maryland to be Held April 20 in Baltimore

Wives of all members of the Medical and Chirurgical Faculty of the State of Maryland, regardless of whether or not they are members of the Woman's Auxiliary to the Faculty, are cordially invited by the Auxiliary's officers to attend the Annual Meeting to be held on Thursday, April 20, at the Sheraton-Belvedere Hotel in Baltimore. They may register either at 2 PM, Wednesday, April 19, in the Red Room on the second floor of the hotel, or at 9 AM, Thursday, on the 12th floor, where a coffee hour will precede the general session, which begins at 10 AM.

Greetings from the Faculty will be presented by E. Roderick Shipley, MD, a member of the Public Relations Committee, which serves as an advisory board to the Woman's Auxiliary. Following the business portion of the session, which will include the presentation of reports from officers and committee chairmen, and the election of officers, Mrs. Wallace H. Sadowsky, president-elect, will receive the Auxiliary gavel from Mrs. Archie R. Cohen, outgoing president.

After a sherry hour from 11:30 AM to 12:30 PM, there will be a luncheon to which members of the Faculty are also invited. It is necessary for all who wish to attend the luncheon to purchase tickets, $3.75 each, in advance. Reservations may be made through Mrs. S. G. Sullivan, 419 Oak Lane, Baltimore, Md 21204.

The theme of this year's convention is "International Health" and the principal speaker at the luncheon will be John W. Walsh, MD, of Washington, DC. Dr. Walsh, who will also speak at the Annual Meeting of the Faculty, will be returning shortly before these speaking engagements from his first voyage with the SS HOPE, which may dock in Baltimore late this year or next year as a result of the efforts of the Faculty's Public Relations Committee.

THE SYMBOL OF DOCTOR'S DAY IS THE RED CARNATION
— DON'T FORGET TO HONOR YOUR HUSBAND ON HIS DAY —
DOCTOR'S DAY — MARCH 30

Mrs. Raymond C. V. Robinson, Doctor's Day Chairman
Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland

Other speakers will include Mrs. Robert F. Beckley, Eastern Regional vice-president of the Woman's Auxiliary to the American Medical Association; J. Morris Reese, MD, president of the Faculty; Rabbi Donald N. Gluckman, of the B'nai Abraham Congregation in Hagerstown, who will give the invocation at the beginning of the program; and Mrs. Sadowsky, the incoming president of the Auxiliary, who will deliver an inaugural address.

Mrs. Robert F. Beckley, Eastern Regional vice-president of the Woman's Auxiliary to the AMA, who will address the Woman's Auxiliary to the Faculty

Mrs. Delmas D. Caples and Mrs. Martin E. Strobel are co-chairmen of the convention. They have been assisted by Mrs. William S. Stone, a past president of the Woman's Auxiliaries to the Medical and Chirurgical Faculty and the Baltimore City Medical Society, and a member of the Board of Directors of the Woman's Auxiliary to the AMA; by Mrs. Thomas S. Boyer, first vice-president of the Woman's Auxiliary to the Faculty; and by the following committee chairmen:

Mrs. David S. Clayman—Hospitality
Mrs. Max R. English—Flowers and Decorations
Mrs. Charles B. Marek—Registration
Mrs. Karl F. Mech—Credentials
Mrs. Percy H. Sutley—Exhibits
Mrs. G. Overton Himmelwright—Awards
Mrs. DeWitt E. DeLawter—Courtesy Resolutions
Mrs. A. Austin Pearre—Necrology

New Members-at-large

We welcome the following new members-at-large to the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland:

Mrs. P. J. Bean, Great Mills (St. Mary's County)
Mrs. Osman Z. Ersoy, Prince Frederick (Calvert County)
Mrs. George E. Groleau, 5204 Benson Avenue (Howard County)
Mrs. J. Roy Guyther, Mechanicsville (St. Mary's County)
Mrs. Justinas Kudirka, 40 North Rolling Road (Howard County)
Mrs. Clifford B. Lull, Braddock Heights (Frederick County)
Mrs. Lionel M. Napp, Crownsville (Anne Arundel County)
Mrs. Frank E. Shipley, Savage (Howard County)

MONTGOMERY COUNTY

The Woman's Auxiliary to the Montgomery County Medical Society held their February 21 meeting at Linden Hall Inn. Mrs. Gail H. Winslow spoke on "Investing for Profit in Today's Unsettled Market." Mrs. Winslow, an investment banker and partner of Ferris and Company, discussed the merits and methods of estate planning. An alumna of Radcliffe College, she did graduate work at the New York Institute of Finance. She has lectured extensively for years, written for

magazines and newspapers, and talked both on the radio and on television.

HARFORD COUNTY

A "baby-tender" was presented to the Harford Memorial Hospital in Havre de Grace by the Woman's Auxiliary to the Harford County Medical Society. The presentation of an article of needed equipment for the pediatric section of the hospital is an annual project of this group. A donation is also made each year to the Harford Day Care Center for Retarded Persons.

The January meeting was held in the home of Mrs. Philip Neuman where a talk and slide presentation was given by a local student, Mrs. Christine Foley of Melbourne, Australia. In February members met in the home of Mrs. Wallace Sadowsky and enjoyed an illustrated talk by Mrs. H. C. Engle on her world-wide travels.

Mrs. Wallace H. Sadowsky, past president of the Woman's Auxiliary to the Harford County Medical Society, at left, and Mrs. James Garey, president, at right, with Mrs. Theresa Green, pediatric nurse at the Harford Memorial Hospital, and small patients, one in the newly-presented "baby-tender."

Diet Control — **Appetite Control**

and now finally
. . . the neglected factor

Ex-Caloric Wafers *

Not marketed in combination with any anorexiant drug, since that would limit the dosage flexibility of both.

A SUBSTITUTE FOR FOOD

A DEVICE TO SATISFY THE HUNGER FOR BULK IN PATIENTS ON A REDUCING DIET.

Designed for bulk hunger . . . not laxation!

EX-CALORIC WAFERS CONTAIN NO LAXATIVE HEMICELLULOSE

DESCRIPTION:
Artificially sweetened and flavored. Each wafer contains 453 mg. of these non-nutritive, synthetic hydrophilic colloid bulking agents: carboxymethylcellulose 181 mg. and methylcellulose (400 centipoise type) 272 mg. Safe for use by diabetic patients placed on a restricted reducing diet. Usual daily intake less than 3 calories per day.

ACTION:
Ex-Caloric Wafers produce such bulk in a part of the alimentary tract as to ordinarily impart a highly satisfactory sense of fullness for those obese patients who complain of an empty feeling ("hollow hunger") when placed on a reducing diet and deprived of their between-meal snacks.

ADMINISTRATION:
3 or 4 wafers t.i.d., a.c. or p.c. or mid-morning, mid-afternoon and mid-evening. At least 1 large glass of water must be taken with each dose.

CONTRAINDICATIONS:
Ex-Caloric Wafers are completely innocuous and may be administered with impunity in any necessary quantities to all obese patients, including children and the aged. The only contraindications are acute ulcerative colitis and organic intestinal obstruction.

ROCHE

WHEN ANXIETY IS A SIGNIFICANT COMPONENT OF THE CLINICAL PROFILE

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. Warn against hazardous occupations requiring complete mental alertness. Use caution in administering to addiction-prone patients or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of child-bearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In elderly and debilitated and in children over five, limit dosage to smallest effective amount, increasing gradually as needed and tolerated. In general, concomitant use with other psychotropics is not recommended. Paradoxical reactions have been reported in psychiatric patients and hyperactive aggressive children. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically. Observe usual precautions in presence of impaired renal or hepatic function, impending depression and suicidal tendencies.

Adverse reactions: Drowsiness, ataxia and confusion may occur, especially in elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. Syncope occurs rarely. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis, jaundice and hepatic dysfunction) may develop occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy. Individual maintenance dosages should be determined.

Dosage: Oral—Adults: Mild to moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d.

Supplied: Capsules, 5 mg, 10 mg and 25 mg—bottles of 50.

PATIENT-UNIT.

BSP, one of the more valuable single laboratory procedures for determining hepatic function, is now packaged in a complete individual patient-unit.

Each BSP Disposable Unit contains a sterile syringe with the 5 mg./kg. BSP dosage schedule imprinted on the barrel, a sterile needle, alcohol swab and a 7.5 ml. or 10 ml. size ampule of terminally sterilized Bromsulphalein solution.

This all-inclusive disposable put-up lessens the chance of cross-infection and saves time and labor— the most costly commodities.

HYNSON, WESTCOTT & DUNNING, INC.

HW&D (BSP03)

BALTIMORE, MARYLAND 21201

Diagnosis:

cystitis?
pyelonephritis?
pyelitis?
urethritis?
prostatitis?

in any case,
usually gram-negative*

Therapy:

two 500 mg. Caplets® q.i.d
(initial adult dose)

Indications: Urinary tract infections caused by gram-negative and some gram-positive organisms.

Side effects: Mainly mild, transient gastrointestinal disturbances; in occasional instances, drowsiness, fatigue, pruritus, rash, urticaria, mild eosinophilia, reversible subjective visual disturbances (overbrightness of lights, change in visual color perception, difficulty in focusing, decrease in visual acuity and double vision), and reversible photosensitivity reactions. Marked overdosage, coupled with certain predisposing factors, has produced brief convulsions in a few patients.

Precautions: As with all new drugs, blood and liver function tests are advisable during prolonged treatment. **Pending further experience, like most chemotherapeutic agents, this drug should not be given in the first trimester of pregnancy. It must be used cautiously in patients with liver disease or severe impairment of kidney function.** Because photosensitivity reactions have occurred in a small number of cases, patients should be cautioned to avoid unnecessary exposure to direct sunlight while receiving NegGram, and if a reaction occurs, therapy should be discontinued. The dosage recommended for adults and children should not arbitrarily be doubled unless under the careful supervision of a physician. Bacterial resistance may develop.

When testing the urine for glucose in patients receiving NegGram, Clinistix® Reagent Strips or Tes-Tape® should be used since other reagents give a false-positive reaction.

Dosage: Adults: Four Gm. daily by mouth (2 Caplets® of 500 mg. four times daily) for one to two weeks. Thereafter, if prolonged treatment is indicated, the dosage may be reduced to two Gm. daily. Children may be given approximately *25 mg. per pound* of body weight per day, administered in divided doses. The dosage recommended above for adults and children should not arbitrarily be doubled unless under the careful supervision of a physician. Until further experience is gained, infants under 1 month should not be treated with the drug.

How supplied: Buff-colored, scored Caplets® of **500 mg. for adults,** conveniently available in bottles of 56 (sufficient for one full week of therapy) and in bottles of 1000. **250 mg. for children,** available in bottles of 56 and 1000.

References: (1) Based on 23 clinical papers, 1512 cases. Bibliography on request. (2) Bush, I. M., Orkin, L. A., and Winter, J. W., in Sylvester, J. C.: Antimicrobial Agents and Chemotherapy—1964, Ann Arbor, American Society for Microbiology, 1965, p. 722.

Winthrop Laboratories, New York, N. Y. 10016

NegGram

Brand of

nalidixic acid

a specific anti-gram-negative

eradicates most urinary tract infections...

- Low incidence of untoward effects; no fungal overgrowth, crystalluria, ototoxic or nephrotoxic effects have been observed.
- "Excellent" or "good" response reported *in more than 2 out of 3* patients with either chronic or acute gram-negative infections.[1]

*As many as 9 out of 10 urinary tract infections are now caused by gram-negative organisms: E. coli, Klebsiella, Aerobacter, Proteus, Paracolon or Pseudomonas[2]... However, infections of the urethra and prostate caused by non-gonococcal gram-negative organisms are believed to be less prevalent.

"George wants to know if it's okay to take his cold medicine now, Doctor, instead of seven o'clock?"

The long-continued action of Novahistine LP should help you both get a good night's sleep. Two tablets in the morning and two in the evening will usually provide round-the-clock relief by helping clear congested air passages for freer breathing. Novahistine LP also helps restore normal mucus secretion and ciliary activity—normal physiologic defenses against infection of the respiratory tract. Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result. Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

YOUR INSPECTION INVITED • BROCHURE ON REQUEST

Your MEDICAL FACULTY at Work

JOHN SARGEANT EXECUTIVE SECRETARY

ON MARCH 2, THE EXECUTIVE COMMITTEE:

1. Received a revision of the Personnel Salaries Study, and deferred action until it could be analyzed.

2. Discussed Chronic Disease Hospital Admission policies with the State Health Commissioner and his aides; heard that the nursing home situation, generally, was acute and that the chronic disease hospitals had some beds closed because of a shortage of trained personnel.

3. Approved a publicity program in connection with the Mass Measles Vaccination project for which the Faculty is providing up to $15,000 for publicity and educational material.

4. Authorized a sustaining membership in the Maryland Public Health Association at a cost of $50.

5. Approved free use of Osler Hall by the State Health Department, Public Health Education Division, for morning sessions for the period of June 21 through July 10.

6. Requested legal counsel to prepare a brief and represent the Faculty at an appeal made by Leonard Flax, MD, before the AMA's Judicial Council.

7. Approved the Faculty's offering assistance in health areas in connection with the "Curlett Report," a report on reorganization of the Executive Branch of the State Government.

8. Agreed to appoint an Ad Hoc Committee to discuss educational programs for Faculty members in connection with the increase in professional liability cases against physicians.

9. Approved payment of expenses of William J. McClafferty, MD, to attend a Washington, DC, meeting on Comprehensive Health Planning.

10. Approved "in principle" the following statements, as requested by the Baltimore City Medical Society Section on Rehabilitation:

"That the Rehabilitation Section of the Baltimore City Medical Society unanimously support the State Health Department in denying certification of Extended Care Facilities unless minimum standards are met as described, under Public Law 89-97, in 'Conditions of Participation for Extended Care Facilities,' a manual published by the Department of Health, Education, and Welfare in March 1966."

"That the Rehabilitation Section of the Baltimore City Medical Society would support the State Health Department in its efforts to establish home care services for stroke patients and would provide consultative services on a fee basis to expedite this type of care."

11. Authorized the attendance of John F. Schaefer, MD, at an AMA Conference on Nursing in Chicago on October 6, 1967, with expenses being underwritten by the AMA.

12. Reaffirmed that "yellow page listings" in the telephone directory are a matter for local determination, as decided by the Council in 1964.

ON MARCH 16, THE COUNCIL:

1. Approved the Report of the Ad Hoc Com-

There are 35,700* undetected diabetics in Maryland

Most of these are probably among patients over 40; the overweight; relatives of diabetics, and mothers of large babies. By the time polyphagia, polyuria, polydipsia, pruritus or other overt symptoms of diabetes appear, damage may have been done that could have been minimized. DEXTROSTIX® gives you a reliable blood-glucose estimate in 60 seconds.

Why Wait?

*Based on Statistical Report, U.S. Dept. Commerce, ed. 86, and Fisher, G. F., and Vavra, H. M.: Pub. Health Rep. 80:961 (Nov.) 1965.

Note: DEXTROSTIX is not meant to replace the more precise analytical laboratory procedures such as needed in glucose tolerance testing.

AMES COMPANY, Division Miles Laboratories, Inc., Elkhardt, Indiana, U.S.A. 42867

Ames

mittee to Revise the Medical Practice Act and referred it to the Semiannual Session, 1967, for approval of the House of Delegates.

2. Ratified legal defense for several cases.

3. Heard of settlement, dismissal and awards in various legal cases against physicians.

4. Approved September 5, 6 and 7 as the dates for the 1968 Semiannual Meeting in Ocean City.

5. Renewed the Executive Secretary's contract for a three-year term on the same basis and with the same conditions as previously.

6. Approved expenditure of up to $7,500 from Library funds for reevaluation of the various rare books that are scattered throughout the stacks to provide a core for a History of Medicine department; removal of "out of scope" books from the stacks, to relieve about 20% of the stack space; and consideration of the recataloguing of the entire collection.

7. Authorized the sending of a letter of intent to the National Library of Medicine so as to ascertain more details about the possibility of constructing an addition to the north of the Faculty building for which 75% of the cost would be borne from federal funds. This does not commit the Faculty in any way.

8. Approved the Fee Schedule Committee's recommendation that the Faculty not renew its CHAMPUS contract (formerly Dependents' Medical Care program for members of the US Armed Forces); and urging that Blue Shield be used as a fiscal intermediary for payments either to physicians or to the dependents who receive care.

9. Deferred action on the report of the PL 89-97 Subcommittee, in connection with payments for services under Titles 18 and 19 of PL 89-97, until such time as legal opinions can be obtained on certain points therein.

10. Designated appointment of a committee to study the admission of Osteopaths to membership in Component Societies, the Faculty and the AMA, as well as to establish a policy for guidance of members in connection with hospital staff membership for Osteopaths.

11. Heard representatives of the Maryland Medical Political Action Committee and the American Medical Political Action Committee.

12. Deferred action until the June 1967 Council meeting on a proposed retirement program for Faculty members under the Med-Chi Insurance Trust.

13. Approved a Policy and Planning Committee recommendation that the State Board of Health and Mental Hygiene be designated as the agent for funds to discuss comprehensive health planning for Maryland.

14. Congratulated Donald J. Roop, MD, Council member, on his appointment as the new Baltimore County Health Officer.

EXECUTIVE SECRETARY'S NEWSLETTER

April, 1967

RESOLUTIONS FOR SEMIANNUAL SESSION

Resolutions for consideration at the Faculty's Semiannual Session scheduled for Friday, September 8, in Ocean City, Md., must be received in the Faculty office by

FRIDAY, JULY 14, 1967.

All Faculty members will be notified of resolutions received and the date of the Reference Committee meeting for discussion of them.

FIFTIETH AND FINAL REUNION

The 50th and final reunion of the Johns Hopkins Unit (Base Hospital #18) of WW I will be held on Saturday, June 17, 1967, at the Sheraton-Baltimore Inn, Baltimore.

Master of Ceremonies for this occasion is E. R. Desch, Clearwater Beach, Florida.

NEWS NOTES

Jacob H. Conn, M.D., gave the Academic Lecture at the Pennsylvania College of Podiatry when he spoke on the Interrelationship of Pain and Anxiety.

Abraham J. Mirkin, M.D., Cumberland, represents the AMA at the World Congress of Motoring Medicine in Vienna, Austria, May 7-13.

William Schuman, M.D., has had a lecture hall dedicated in his name at the North Charles General Hospital in recognition of his educational activities at the hospital.

Walter F. Ballinger, II, M.D., has been named Bixby Professor and Head of the Department of Surgery at the Washington University School of Medicine, St. Louis.

Bryan D. Brogdon, M.D., will assume the post of Professor of Radiology at the University of New Mexico School of Medicine in June.

George D. Zuidema, M.D., is a member of a 28-man committee on Surgical Education in

Medical Schools recently named by the American College of Surgeons.

Dr. Walter Ballinger has also been designated as chairman of the Pre and Post-operative Care postgraduate course at the ACS meeting in Chicago.

OPHTHALMOLOGISTS ACCEPT SPEAKING ENGAGEMENTS

Participating actively in the speakers' bureau operated by the Maryland Society for the Prevention of Blindness are the following Ophthalmologists: Drs. Alfred A. Filar, Vincent Eareckson, Arnall Patz, Abraham Kremen, Gregory Sophocleus and Richard E. Hoover.

FIRST AID ROOM IN ANNAPOLIS

The First Aid room sponsored by the Faculty, in cooperation with the Anne Arundel County Health Department, Medical Society and General Hospital was actively used again this year by both legislators and personnel working with them.

In the closing days of the session, most common item dispensed was antacid tablets and headache pills, for not uncommon complaints at that time.

DRUG CHANGE

Paregoric prescriptions have been changed from Class A to Class B by the Division of Drug Control, State Department of Health. This permits prescriptions for this drug to be telephoned to the pharmacist.

DEPENDENTS MEDICAL CARE PROGRAM CHANGE

All physicians are urged to read carefully the item contained in the latest issue of The Assemblyman, which explains in detail the recent billing changes made in the Armed Forces Dependents Medical Care program. (Formerly known as ODMC, it became the Comprehensive Health and Medical Program for Uniform Service, or CHAMPUS, a short time ago.)

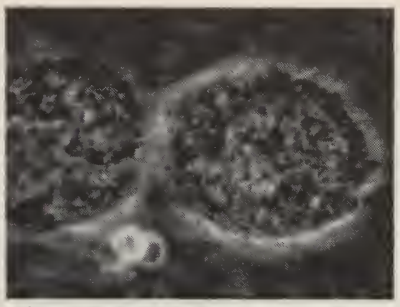
INFLAMMATION: A cellular fight for life

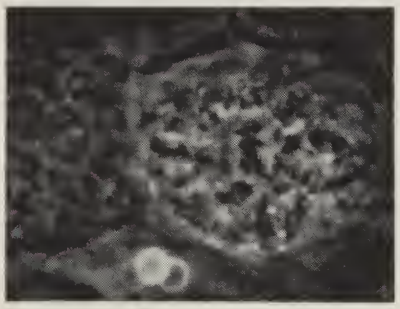
A SYNTEX REPORT based on recently developed hypotheses about topical corticosteroids, including the cellular theories of inflammation by Thomas F. Dougherty, Ph.D., University of Utah.

You are looking at a fibroblast fighting for life. This cell—one of the most common found in connective tissue—has literally been poisoned by cytotoxins released from other cells that have ruptured. Soon, if the abnormal activity of this fibroblast does not cease, it, too, will rupture and die—one more casualty in the inflammatory wave of destruction precipitated by injury.

Until a short time ago no one had ever witnessed such a scene at the cellular level. Now, through advanced cinemicrographic techniques, it is possible to view and photograph the inflammatory process as produced experimentally in living animal tissue. This method permits new insight into the mechanism of inflammation and the role of corticosteroids in therapeutic management. Equally important, these techniques shed new light on factors that may make one corticosteroid more effective than another—factors that can be correlated with other chemical, biologic, and clinical parameters.



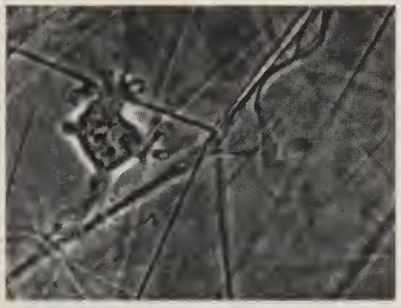
Visual evidence of how corticosteroids influence the inflammatory reaction



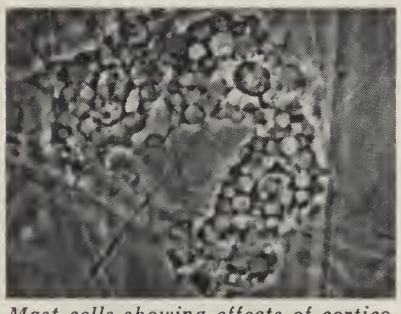
Working with phase-contrast cinemicrography on living animal tissue, Doctors Thomas F. Dougherty and David Berliner of the University of Utah College of Medicine have actually filmed cellular events that occur during the inflammatory reaction. This remarkable study* and additional work by these investigators, as well as by others, have established a new theoretical biologic basis for the antiinflammatory effect of the corticosteroids. (It must be noted that other theories, such as the lysosome or so-called "suicide bag" theory, have been postulated, although it is quite likely that there are more similarities than differences among the various theoretical models.)

The inflammatory wave of destruction

In this investigation an injurious injection of gelatin is used to set off an inflammatory reaction in living mouse tissue. What follows is a wave of destructive cellular activity that comprises the inflammatory response to injury. Mast cells (which contain heparin, serotonin and histamine) take up water, swell and rupture, releasing their contents, which are toxic outside the mast cell wall. These toxins, in turn, cause disintegration of other cells (such as fibroblasts) and the release of additional toxic material. Capillaries, too, take up water and leak unformed blood elements, causing edema. And polymorphonuclears, lymphocytes and perithelial cells invade the inflamed site. As a result of all these changes, the cellular environment reaches a state of turmoil.



Phase-contrast microscopy showing mast cell before injury.



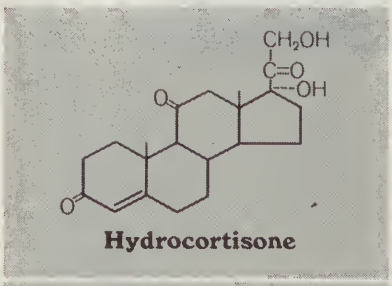
Mast cell (after injury) has broken up and released cytotoxins.

How corticosteroids change the picture

Corticosteroids appear to virtually stop the abnormal cellular activity that constitutes the inflammatory reaction. This permits the body's natural resources to clear up the inflamed area and repair the damaged tissue. This interpretation is supported by the fact that when the injurious gelatin solution is injected simultaneously with a corticosteroid — Synalar (fluocinolone acetonide) — the inflammatory pattern simply does not develop.

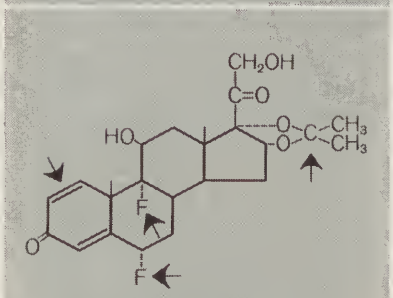
Fibroblast in high state of activity, much distorted.

Mast cells showing effects of corticosteroid action: cells are normal in size, shape and activity.



In summarizing his study Doctor Dougherty states: "...we also feel this work may explain why one corticosteroid helps a patient more rapidly and effectively than another. If it does, it is because one corticosteroid is the fastest, most effective inhibitor of the series of inflammatory events at the tissue level."

**A New View of Corticosteroid Action in Inflammatory Dermatoses,* a film based on this study, is now available from your Syntex representative.

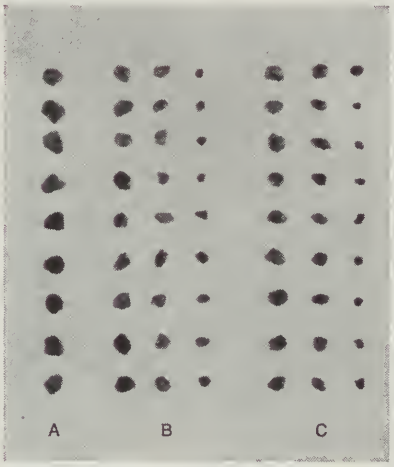


See last page for contraindications, precautions, side effects and dosage.

How advances in chemical design have achieved greater steroid potency

The chemical modification of corticosteroid molecules from the advent of hydrocortisone to the development of Synalar (fluocinolone acetonide) is a prime example of how biochemists can "design" to increase therapeutic activity and minimize undesirable side actions. Below, for example, we see the important changes that were made in reference to the hydrocortisone molecule to produce fluocinolone acetonide, one of the most active of all topical corticosteroids. As a result, a 0.01% preparation of Synalar (fluocinolone acetonide) has been reported to do the work of a 1% hydrocortisone product containing 100 times more cortiscosteroid. And it can often do it more effectively.

Hydrocortisone



Fluocinolone Acetonide (Synalar)

- *a double bond between carbons 1 and 2*
- *fluorine substitutions at* both *the 6-α, and the 9-α positions*
- *the addition of the acetonide at the 16-α, 17-α positions, thus providing one of the most potent topical corticosteroids available.*

How bioassay tests are used to "predict" therapeutic potential

Biologic assays are another tool used by researchers to help establish the relative activity of corticosteroids. To date no single method of assaying corticosteroid activity has emerged as the ideal "yardstick" for predicting therapeutic potential. Taken together, however, these methods have proved useful. When such tests are run on various corticosteroids, a definite order of corticosteroid activity becomes evident. Compounds with the highest order of activity may be expected to merit clinical trial to establish their high therapeutic potential. When assayed by these methods, fluocinolone acetonide (Synalar) emerges as one of the most active topical corticosteroids, milligram for milligram, available for clinical application today.

THE THYMUS INVOLUTION ASSAY[1-4] is run on adrenalectomized rats. The sizes of the glands are measured, and the degree of involution caused by the steroid is determined as an indication of its potency. In the above photo, the comparative involution of thymus glands achieved with hydrocortisone and Synalar (fluocinolone acetonide) is shown. Untreated controls (A) show normal size. Group B – injected with 1, 2 and 4 mg. of hydrocortisone – show progressively smaller thymuses as does Group C – injected with fluocinolone acetonide – but with only 1/500th the dose of hydrocortisone.

THE ANTIGRANULOMA ASSAY[1-4] also utilizes adrenalectomized rats. Granulomas are induced by subcutaneous implantation of cotton pellets on either side of the thorax. The degree of granuloma inhibition achieved by a steroid reflects its potency. The above photo shows the inhibition of granuloma formation achieved with hydrocortisone and Synalar (fluocinolone acetonide). Untreated controls (A) show large, red granulomas adhering to the pellets. Group B, receiving hydrocortisone and Group C, receiving fluocinolone acetonide, show little, if any, granuloma formation. Fluocinolone acetonide produced the same effect as hydrocortisone with only 1/500th the dose. This assay, as well as the thymus involution assay, measures systemic rather than topical corticosteroid activity. Nevertheless, results by these methods correlate well with other assays and with the milligram potencies of topical steroids in current clinical use.

Worldwide clinical experience confirms the predictable therapeutic potential of Synalar

It is particularly gratifying that the promise of the advanced chemical design and high order of bioassay activity of Synalar (fluocinolone acetonide) has been confirmed by widespread therapeutic application. Indeed, the impressive clinical response rate of Synalar has been documented in no fewer than 232 papers from 22 countries.

Representative Clinical Results with Synalar*

Efficacy Documented in over 4,000 Patients

Condition	Number of Publications	Number of Patients	Significant Improvement†

*Complete bibliography on request.

†Expressed by the authors as excellent, very good, good, complete remission of inflammation, etc.

PRESCRIBING INFORMATION

For initiation of therapy: Cream 0.025%, 5 and 15 Gm. tubes, 425 Gm. jars; *for emollient effect:* Ointment 0.025%, 15 Gm. tubes; *for maintenance therapy:* Cream 0.01%, 15 and 45 Gm. tubes, 120 Gm. jars; *for intertriginous or hairy sites:* Solution 0.01%, 20 cc. and 60 cc. plastic squeeze bottles; *for infected inflammatory dermatoses:* Neo-Synalar® Cream (0.025% fluocinolone acetonide, neomycin sulfate, equivalent to 0.35% neomycin base), 5 and 15 Gm. tubes.

CONTRAINDICATIONS: Tuberculous, fungal, and most viral lesions of the skin, (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components. PRECAUTIONS: Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. Prolonged use of any antibiotic may result in overgrowth of nonsusceptible organisms; if this occurs, appropriate therapy should be instituted. When severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. SIDE EFFECTS: Side effects are not ordinarily encountered with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. The neomycin in Neo-Synalar Cream rarely produces allergic reactions.

From Washington

The US Department of Health, Education, and Welfare stated in a special report that both hospital charges and physicians' fees increased sharply last year. A continued increase in health care costs was predicted in the report, which was ordered last August by President Johnson.

Drugs were not a significant factor in the recent accelerated increase in health care prices, the report said, but it added that "drug prices are higher than they would be if there were more vigorous competition at either the manufacturing or drugstore level."

As for the two major components in the Medical Care Index, the report said physicians' fees, which had been rising about 3% a year from 1960 through 1965, went up 7.8% in 1966—the biggest annual increase since 1927; and hospital daily charges, which rose about 6% a year between 1960 and 1965, went up 16.5% in 1966—the largest annual increase in 18 years.

The increase in doctor fees was attributed to a combination of basic factors: more people are seeking doctors' services more often and the number of active physicians is increasing relatively slowly. The study found no evidence that Medicare, which went into effect last July 1, was a major factor in the rise in doctors' fees.

The increase in hospital charges was attributed largely to rising wages, which account for two-thirds of hospital costs, and increases in the price of things hospitals buy. The wage rise has not been offset by increased productivity, the report said, and rising standards of care in hospitals have required more expensive equipment and facilities.

Meantime, Robert J. Myers, the Social Security Administration's chief actuary, told the House Ways & Means Committee that hospital costs had risen much faster than the Administration anticipated since the Medicare plan went into effect. If they continue their upward spiral, the costs will eat away the safety margin included under the Medicare financing plan, Myers said.

The HEW report held out little hope for an early end to medical price increases; however, it recommended a series of actions "to slow down these increases and to promote the efficient use of medical care resources."

Recommendations in the report included:

—Comprehensive community health care systems should be developed, demonstrated, and evaluated.

—Group practice, especially prepaid group practice, should be encouraged.

—Private and public health insurance plans should be broadened to include more alternative types of medical care.

—States should move quickly to establish and support strong health planning agencies at the state and local levels.

—Cost-reducing methods of reorganizing the delivery of services in hospitals and other providers of health services should be developed, demonstrated, and implemented.

—Federally supported health care programs should be used to train physician assistants, evaluate their performance, and disseminate the results.

—Federal funds available under the Health Professions Educational Assistance Amendments of 1965 should be used to support and encourage innovations in health professionals' education and training that promote the efficient practice of medicine.

—HEW should undertake an intensive examination of frequently prescribed drugs to assess the therapeutic effectiveness of brand name products and their supposed generic equivalents.

—The Food and Drug Administration should provide doctors with authoritative information on the efficacy and side effects of all drugs.

—The HEW should call a national conference of leaders of the medical community and of public

A monthly summary of Washington news prepared in the Washington, DC, office of the American Medical Association.

representatives to discuss ways to improve the quality and efficiency of medical care delivery.

To carry out the recommendations in the report and allied directives from Johnson, HEW Secretary John W. Gardner said he would take a number of actions, including establishment of a National Center for Health Services Research and Development and calling of a national conference on medical care costs.

* * * * *

The American Medical Association contends there is not sufficient justification for a federal law that would ban dispensing of drugs and devices, such as eyeglasses, by physicians.

James Z. Appel, MD, immediate past president of the AMA, outlined the AMA position in testimony before the Senate Antitrust and Monopoly Subcommittee which held hearings on such legislation (S. 260) introduced by its chairman, Sen. Philip A. Hart (D., Mich.).

The legislation appeared to stand little chance of being approved by Congress, at least this year. Hart has unsuccessfully pushed similar legislation for the past few years.

The AMA believes that "federal legislation cannot be justified unless there is a compelling need," Appel testified. In this case, he said, "such a need does not exist."

"Organized medicine looks upon dispensing as neither immoral nor unethical in and of itself," the AMA official said. "Organized medicine believes—and the medical practice laws of the states confirm—that dispensing drugs and devices is a privilege granted to physicians in order that they may best serve the public interest.

". . . American medicine condemns any abuse of privilege. But the bill under consideration would withdraw the privilege entirely, regardless of its benefits for the many, because it is abused by the insignificant few."

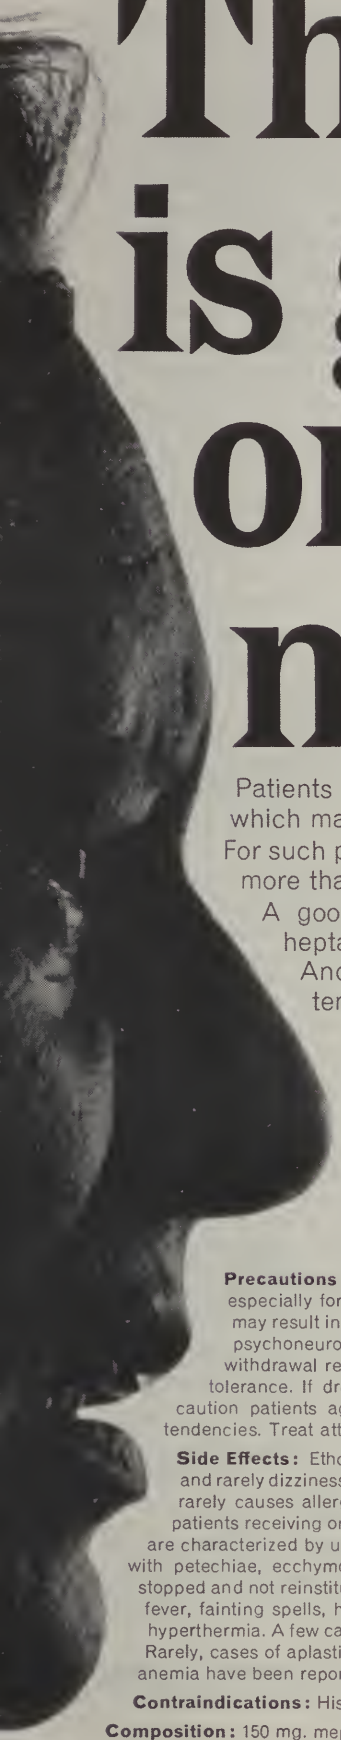
From Coronado

Physicians and nurses must seek ways of establishing broader professional communication in order to satisfy the public's rising demand for more comprehensive, personalized medical care: this was an area of major agreement at the Third National Conference for Professional Nurses and Physicians held recently at Coronado, Calif.

The conference, jointly sponsored by the American Nurses' Association and the American Medical Association, brought together 47 selected representatives of each profession for two-and-one-half days of face-to-face talks about the needs of the sick person.

Samuel P. Martin, MD, provost, University of Florida Health Center, outlined the patient's needs in a keynote address at the start of the conference. Drawing upon a number of patient characteristics found in recent detailed studies, Dr. Martin concluded that patient needs are (1) to be considered as a person, not a disease syndrome; (2) a care system which is immediately available and obvious, and which has continuity over his life span and operates whether symptoms exist or not; (3) a system which relates closely to the culture, utilizes the forces of the social system, and directs its efforts not only toward the patient, but toward his total environment; and (4) assurance that the system of care is of the highest quality.

During workshop sessions there seemed to be general agreement that these needs can be met only through a multi-discipline, well coordinated health care system since the wide range of skills and knowledge required is beyond the comprehension of any one person, speciality or discipline. The application and coordination of these skills are generally the responsibility of the physician and nurse, many participants agreed.



Another keynote speaker, Rhetaugh Graves Dumas, MSN, assistant professor, Yale University School of Nursing, said nurses and physicians view the patient from different perspectives.

"It is at the level of practice—the operational level, if you will—that views diverge both within and between medicine and nursing," she said. "Here each practitioner experiences the sick person within the limits imposed by professional prerogatives, functional responsibilities, interpersonal and technical competency, and physical and social framework within which he practices."

There was a consensus among the conference participants that this divergent viewpoint between the two disciplines must be overcome as a first and major step in fulfilling the needs of the patient. Improved communication between nurses and physicians at the local level was most often suggested as the ideal and most practical method of accomplishing this.

Workshop participants suggested the two pro-

This pain is getting on my nerves.

Patients in pain often experience concomitant anxiety and tension, which may add to the burden of pain.

For such patients, you may want to prescribe a preparation that offers more than simple analgesia.

A good choice is often EQUAGESIC® (meprobamate and ethoheptazine citrate with aspirin). It helps relieve pain. And anxiety. And skeletal muscle spasm as related to pain or anxiety and tension.

Equagesic® TABLETS
(meprobamate and ethoheptazine citrate with aspirin)

Wyeth®

Precautions: Keep out of reach of children. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use of meprobamate may result in dependence or habituation in susceptible persons—as ex-addicts, alcoholics, severe psychoneurotics. Withdraw gradually after prolonged high dosage to avoid possibly severe withdrawal reactions including epileptiform seizures. Warn patients of possible reduced alcohol tolerance. If drowsiness, ataxia or visual disturbances occur, reduce dose. If symptoms persist, caution patients against operating machinery or driving. Give cautiously to patients with suicidal tendencies. Treat attempted suicide with immediate gastric lavage and appropriate supportive therapy.

Side Effects: Ethoheptazine and aspirin may occasionally cause nausea, vomiting, epigastric distress, and rarely dizziness and CNS depression. Overdosage may result in salicylate intoxication. Meprobamate rarely causes allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever have been reported. Meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioedema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. A few cases of leukopenia, usually transient, have been reported following prolonged dosage. Rarely, cases of aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis, and hemolytic anemia have been reported; almost always, in the presence of known toxic agents.

Contraindications: History of sensitivity or severe intolerance to aspirin or meprobamate.

Composition: 150 mg. meprobamate, 75 mg. ethoheptazine citrate and 250 mg. aspirin per tablet.

fessions (1) promote establishment of joint liaison groups at the local level; (2) work together to develop model patient care plans designed to satisfy the patient's needs; (3) cooperate in altering established systems and methods which may tend to inhibit delivery of needed patient care; and (4) seek ways to provide time to bring the doctor and nurse together for formal and informal consultations and conferences concerning the care of the individual patient.

Among more controversial suggestions was that the two professions investigate the possibility of providing mutual educational experiences for physicians and nurses to establish an early rapport and appreciation for mutual problems.

From an AMA-ANA news release, March 1967.

From Chicago

The following opinion regarding the ethical responsibilities of physicians in prescribing drugs and devices was adopted by the Judicial Council of the AMA on March 12:

> It is unethical for a physician to be influenced in the prescribing of drugs or devices by his direct or indirect financial interest in a pharmaceutical firm or other supplier. It is immaterial whether the firm manufactures or repackages the products involved.
>
> It is unethical for a physician to own stock or have a direct or indirect financial interest in a firm that uses its relationship with physician-stockholders as a means of inducing or influencing them to prescribe the firm's products. Practicing physicians should divest themselves of any financial interest in firms that use this form of sales promotion. Reputable firms rely upon quality and efficacy to sell their products under competitive circumstances, and not upon appeal to physicians with financial involvements which might influence them in their prescribing.
>
> Prescribing for patients involves more than the designation of drugs or devices which are most likely to prove efficacious in the treatment of a patient. The physician has an ethical responsibility to assure that high quality products will be dispensed to his patient. Obviously, the benefits of the physician's skill are diminished if the patient receives drugs or devices of inferior quality.
>
> Inasmuch as the physician should also be mindful of the cost to his patients of drugs or devices he prescribes, he may properly discuss with patients both quality and cost.
>
> *From an AMA news release, March 1967.*

The Brain Drain

In the past eight years nearly 125,000 of Europe's best educated young people have in one way or another sought admittance to the United

States. They are graduate physicians in search of high-quality advanced education and the right to work unfettered by red tape and restrictions. Not finding it in their homelands, they turned to the United States.

Actually only a fraction of the 15,000 to 20,000 hopeful young doctors seeking entry each year ever arrive here. Figures of the Association of American Medical Colleges show that of those who take the Educational Council for Foreign Medical Graduates examination, only about one-fifth are accepted. Still, that means that about 4,000 are arriving from Europe annually to work and study in medical schools and hospitals. And a large number of these are staying to practice medicine.

They are of all nationalities—German, French, Austrian, Swedish, and especially English. And their loss has helped create what for Europe is a major problem—the so-called "brain drain."

Medicine is not the only branch of science involved in the brain drain. Europe is also losing engineers, chemists, physicists—in fact scientists and technicians in all areas—to the United States. But the major exodus seems to be among the medically oriented.

The implications of the flight of its scientifically educated young has European leaders frankly worried. There is concern that the continent has become undeveloped scientifically and technologically in comparison with the United States. Moreover, the gap is growing.

Even the Russians are fretful. For while they permit no emigration, they feel that because of the absence of scientific give-and-take in Europe generally, their own scientific programs are suffering.

Premier Kosygin of the Soviet Union made this clear during his visit to France. He proposed a "technological alliance" between Russian and Western Europe in order to end what he indicated was the dependence of Europe on advance made in the United States.

Far more concerned with the outcome of the brain drain, however, is Great Britain. The emigration of its young physicians has threatened Britain's National Health Service (NHS) with collapse.

According to their own surveys, about one-third of Britain's medical graduates are leaving the country each year. What's more, the number of medical students going into training has been

SLEEP ZONE

To turn a hospital zone into a sleep zone, you need more than peace and quiet. Your patients need a mattress which gives the right kind of firm, comfortable support. To hospitals across the country, this means the Serta Perfect Sleeper "Hospital" mattress.

It provides restful, healthful sleep, because the patient sleeps on it, not in it. And just as important to you, the Serta Perfect Sleeper retains its firmness for years and years of service.

Interested? There's a Serta contract bedding expert near you. Let him help you choose from the comprehensive range of specifications on Serta quality bedding.

falling steadily.

An eminent barrister, R. H. Davison, outlining the British health service dilemma, reported in the British Medical Journal: "Not only has the NHS provided outrageous terms and conditions of service, it has completely failed to inspire respect among the younger members of the profession who see through its Fabian humbug."

He noted that even the supply of doctors being imported from Pakistan and India to help fill the vacuum of British doctors was dwindling, and criticized the government suggestion "that the advent of the Common Market will permit us to import Italian doctors to run our Health Service."

"Clearly," Davison wrote, "fourteen years of socialism have made us completely shameless, for no one can believe these policies to be in the national interest."

That was five years ago. Since then the tempo of emigration from Britain has accelerated despite government efforts.

Why? The consensus of those British physicians arriving in this country seems to be that they have no wish to be "hand maidens of the government." As one young resident said: "We're not exactly forced into servitude by the government, but we're not exactly free to practice our profession either. At least in America there is still a choice. But what would happen if that choice were removed, as it has been in Europe? Where would American doctors emigrate to?"

What has caused the drain of European brains? Is it money? Or is it something else?

Partly it is money. British interns say they work an average 100 hours a week for less than $200 a month. That figures out to about 45¢ an hour. But the greater issue clearly is one of "scientific climate." Over-regulated conditions have served to stymie scientific inquiry; without scientific inquiry there is lack of stimulation; and without stimulation scientific advancement suffers. So goes the analysis of what is wrong with science in Europe.

This, of course, is an oversimplification. But the fact is that the young, scientifically-oriented have shown by their desire to vacate Europe that something about the scientific climate there is inadequate, if not stifling. And whatever it is, the medical school graduates of Europe have turned to the United States in order to get into the

mainstream of medical science.

American medicine became a lure to European doctors following World War II when it became clear that the United States had emerged in the forefront of medicine and, despite the efforts by some to downgrade the image of American medicine in order to foster a European system of medicine in this nation, the United States has continued to better its standing. If this were not so, the "brains" of Europe would not be seeking entry, for they crave scientific excellence along with freedom to practice their profession.

How good is medical science in America? A clear-cut answer is not easily obtained. Some critics, basing their argument wholly on one statistic or another, contend it is not very good. They maintain that because the infant mortality rates and the average life span in certain small European nations are somewhat better than our statistics, these nations have better medicine.

Actually such statistics fail dismally as a yardstick for measuring the quality of a nation's medicine. Totally ignored in the conjectures based on these tables are such factors as genetic makeup, economic conditions, educational levels and other matters including abortion laws, all of which are reflected in statistics. For example, one of the best assurances of a ripe old age is to be born into a family with a history of longevity. This is a matter of genes, and has nothing to do with medicine. Medicine of course, plays a role in longevity, but it is only one factor of several. Similarly, one of the best buffers against infant mortality is a mother well-educated in the facts of childbearing before she becomes pregnant.

The fact is, of course, medical and scientific quality cannot be based on one lone statistical table. Rather it must be judged on the sum total of numerous factors. Such a compilation clearly indicates that the young Europeans are probably right —the United States is the leader in medical science.

In the 21 years since World War II, 23 Americans have been awarded the Nobel Prize in medicine and physiology. That is more than was won by physicians and scientists from all of the other countries of the world combined.

In the same period, well over half of all the major new drug discoveries were developed in this country. As a matter of fact, 80% of the

prescriptions written today could not have been written ten years ago because the drugs did not exist then.

Medical progress cannot be measured only in the laboratory, however. It must also be measured in terms of people, disease, and facilities. Thus the fact that America was building 750 hospitals in the same time that England was building one also enters the picture.

So do such matters as the rate of death from various diseases. The death rate from cancer in America, for example, is well below the rate of Western Europe. And since cancer is treatable to some extent, our lower death rate could be interpreted as better medical treatment. The same holds true for other treatable diseases, including tuberculosis, pneumonia, strokes and influenza. All of these kill fewer people here, per capita, than in Western Europe.

What it all adds up to is that 4.5 million Americans alive today would be dead if medicine were practiced with the same amount of knowledge and the same tools as it was just 25 years ago. In that time span—in the past 25 years—medicine has learned more than it learned in the previous 50 centuries.

No one can assign a nationality to such knowledge—it is worldwide—but when it comes to teaching and applying that knowledge, the rest of the medical world looks to the United States for leadership.

AMA news release, Feb 1967.

"Bold New Approach"

An audience of 400, made up of senators, congressmen, government officials and community leaders from all parts of the country, attended the Washington premiere showing of the film *Bold New Approach* in the new Senate Office Building auditorium on March 21.

The film is a documentary portraying the way in which community mental health centers can be established and developed by local communities using Federal support to help finance construction and staffing of the centers, under terms of the Community Mental Health Centers Act.

Produced for the National Institute of Mental Health, Public Health Service, Department of Health, Education, and Welfare by the Mental Health Film Board, Inc., *Bold New Approach* draws its title from the late President Kennedy's 1963 health message to the 88th Congress. At that time, he called for "a bold, new approach" toward solving the problems of mental illness.

In welcoming guests at the premiere and reception, Senator Lister Hill (D. Ala.) said, "The size and composition of this audience is indicative of the widespread and growing interest of people across the entire country in our national mental health program, particularly in current efforts to establish community mental health centers in which comprehensive mental health services will one day be available to all who need them.

"We have made a solid beginning," the Senator continued, "but the demand for mental health services is so great that we cannot stop here. It was my privilege, acting in conjunction with Mr. Harley Staggers (D. W Va) in the House of Representatives, to introduce bills in this Congress to extend the community health program.

"With this new legislation, the centers program can continue to grow and more communities will be able to treat their mentally ill, their disturbed children and other individuals who have specific problems such as drug addiction or the misuse of alcohol. The proposed legislation is part of the current national effort to make all health services —including mental health services—available and accessible to everyone."

As of March 7, the Senator stated, Federal grants totalling $66,029,301 have been made to 157 community mental health centers in 44 States, Puerto Rico and the District of Columbia to serve an estimated 27 million Americans.

Bold New Approach depicts the center's revolutionary approach to the prevention and treatment of mental illness by dramatizing the plight of a young girl and the emotional problems of a middle-aged wage earner. Each receives appropriate treatment and rehabilitation through the range of services offered by their community mental health center.

The film also serves as a graphic guide to community groups interested in establishing a centers program by adding their existing mental health services.

Bold New Approach is available for sale and rental from the Mental Health Film Board, Inc., of New York, or on free loan through the Public Health Service Audiovisual Facility, Communicable Disease Center, Atlanta, Georgia.

NIMH news release, March 1967.

Federal Research Grants

"The American Medical Association should support in general the Federal biomedical research program . . . However . . . the AMA has an obligation to the public and to the medical profession to question any facet of the Federal biomedical research program which it may believe to be ill-advised."

This is the primary recommendation of the AMA's Commission on Research, named by the Board of Trustees two-and-one-half years ago to assess the impact of Federal government support upon research itself, and upon medical schools, the education of physicians and the provision of medical services.

The Commission, headed by former US Supreme Court Justice Charles E. Whittaker, of Kansas City, Mo, presented its report to the AMA Trustees following its seventh and final meeting on Feb. 3, 1967.

"While the findings of this Commission regarding Federal impact on medical research are on the whole favorable, the Commission has observed stresses and strains within the growth and development of Federally-sponsored research which call for remedial action," Justice Whittaker declared.

Wesley W. Hall, MD, of Reno, Nev, chairman of the AMA Board, said: "This report, because of the importance and current applicability of many of the issues considered, will undoubtedly evoke widespread interest. The Board, therefore, has approved its immediate publication. At a later date the Board will react formally to the report and, in addition, will submit it to the House of Delegates for final action." With submission of the report, the Commission completed its work and was discharged with thanks from the Board.

Other members of the Commission were Robert C. Hardin, MD, dean of the State University of Iowa College of Medicine, Iowa City; Irvin E. Hendryson, MD, Denver, an AMA trustee; Richard L. Meiling, MD, dean of the Ohio State University College of Medicine, Columbus, and an AMA delegate; Thomas W. Phelps, investment counselor with Scudder, Stevens & Clark, New York; Raymond M. Rice, MD, vice-president of Eli Lilly & Co., Indianapolis; William R. Willard, MD, vice-president of the University of Kentucky Medical Center, Lexington, and a member of the AMA Council on Medical Education; and David A. Wood, MD, director of the Cancer Research Institute of the University of California School of Medicine, San Francisco, and member of the AMA Council on Voluntary Health Agencies. Joseph D. Cooper, PhD, professor of government at Howard University, Washington, DC, was consultant to the Commission. Its secretary was Ernest B. Howard, MD, assistant executive vice-president of the AMA.

The full report of the Commission will be available shortly. Summaries of its conclusions and recommendations, as presented in an AMA *News Release*, are reprinted here, verbatim:

SUMMARY OF CONCLUSIONS OF THE COMMISSION

I

Responsive to the Board's first charge to the Commission to determine "the impact of Federal research grants on (a) medical education; (b) the institution involved; and (c) the nation's scientific and technical resources," the Commission concludes that:

1. The nation's great scientific and technical resources have been enormously expanded in the area of biomedical research since World War II and particularly in the last ten years as a result of leadership and emphasis provided by both the Executive and Legislative Branches of the Federal Government and resulting financial support. We concur in the general belief that the current level of adequacy and excellence of our biomedical research resources has never before been equaled, although it is probable that the abundant Federal funds for research have inescapably supported a measure of mediocrity as well as the nation's best in scientific medical talent.

2. Federal support of biomedical research has become a permanent element of our nation's policy. This support is responsive to popular demand that the conquest of disease and the betterment of the condition of man become national priorities.

3. The support of biomedical research has had a profound impact on medical schools, favorable in many respects, adverse in some, and complex in most. On the whole, medical school programs have been enriched through support of research activities. Furthermore, without the system of grants which has evolved in recent years, many medical schools would have been in danger of collapse, and biomedical research and educational programs would have been jeopardized. The most critical source of difficulty has been that support of the total responsibilities of medical schools has proceeded unevenly so that imbalances have developed among the interrelated areas of research, teaching, and patient care in some medical school faculties and in some teaching hospitals.

4. The heavy infusion of research dollars, particularly through selected faculty members and departments and independent research institutes and facilities, has glamorized research activity and contributed to a

in each separate right or capacity

"flight from teaching" of individual investigators.

5. The Commission's most important conclusion with respect to its first charge is: The adverse effects of Federal research grants on medical schools arise from many sources. Primarily they arise from the imbalance caused by burgeoning financial support for research—in the midst of a relative scarcity of funds for educational programs.

6. As the principal source of biomedical research support, the National Institutes of Health has commendably avoided using its vast powers to influence academic decisions. Nevertheless, the principle still holds that a preponderance of Federal support tends in the long run to lead to Federal control. In the past few years, several developments have occurred which point to the possibility of increased Federal control over the purposes for which Federal research funds are to be used and over the manner in which they are expended.

7. The past rate of growth of support of biomedical research has not recently been maintained. Meanwhile the increasing cost of research has imposed a squeeze on available funds and thereby tightened competition for them. Within the past several years, the costs of supporting an investigator have doubled. Research proposals are becoming more sophisticated while equipment is becoming more complex and expensive. The net effect of these changes is to compel the establishment of priorities for funds and to increase the demand for accountability.

8. The study section arrangement organized by the NIH for review of proposed project grants through panels of outside academic experts (or peer groups) has been successful in identifying and supporting research of quality.

9. The policy of the Congress that universities and medical schools must share in the overhead cost of research projects has imposed difficulties upon many academic institutions. The policy of requiring the schools to share overhead costs, even though their shares may be relatively small, has been intended to insure that schools participate only in research that is deemed to be of such importance to the school's program that it is willing to commit some of its funds to the project. In view of the large volume of Federal research now conducted in the medical school, however, with the prospect that this may increase in the future, and in view of the hardly sufficient funds available to the schools to pay the costs of their basic operations, this "cost sharing" policy diverts institutional non-Federal dollars to research that are needed, and otherwise would be used, for teaching programs.

10. The current modest "institutional grants" to schools for independent allocation by the schools to their own faculty researchers have had a salutary effect in restoring at least some measure of institutional control. Several investigative bodies and many distinguished leaders are now urging—and we concur—that a higher percentage of the Federal research monies now going into project grants be shifted to institutional grants and that this money be administered by and in the discretion of the medical schools.

11. The emphasis in project grants has enriched the research capability of the more affluent schools, which are more abundantly endowed with distinguished investigators and both Federal and non-Federal funds, while leaving the other schools relatively poorer.

12. The technique of direct Government support of some investigators, albeit through the administrative machinery of the university, and the predominant use of project grants for supporting research have created problems in most medical schools. Particularly, they have tended to create divided loyalties and disruption of administrative authority.

13. It is widely recognized that the medical schools and their parent universities must share responsibility for whatever imbalances now exist, due to their failures to define their objectives and roles and to develop management capability commensurate with the complex relationships brought about by their Federally-financed expansions of activity.

II

The second charge to the Commission was to determine "The effect of the expanding Federal research role on the broad areas of medical service outside of medical education." The conclusions of the Commission are:

14. The improved quality of patient care currently available reflects, to a significant degree, the expanded research knowledge created in the last decade.

15. The prevailing patterns of disease have been changed profoundly by research progress. Advances in immunization and antimicrobial therapy, as well as public health innovations, have reduced many communicable diseases to controllable levels. Longevity has increased, neonatal mortality can be expected to continue its decline, and other health indices are showing

similar progress.

16. The research projects that will have the most important effects on medical service, certainly in the immediate future, are those relating to the development of new methods in the provision of health care and the administration of health services. These projects involve the study of the roles of different members of the health care team, the economics of health care, the role of the medical center in the health care complex, and the coordination and regionalization of health care services.

III

The third charge to the Commission was to determine "The effect of Federal spending on private giving and the ability of the latter to make a meaningful contribution." The Commission's conclusions relating to that charge are:

17. All sources of support of biochemical research, governmental, private foundation, and industrial, have increased in recent years. Non-governmental support would be considered significantly increased were it not for a much sharper relative increase of Federal funds for research. Consequently, the sheer preponderance of Federal support has made academic institutions primarily dependent on a single main source, with implications for loss of local autonomy.

18. Notwithstanding the sharp reduction in the ratio of private giving to Federal giving, private foundations still can make significant contributions by providing funds for talented investigators who, for one reason or another, do not receive Federal support and by making funds available for those unique and unusual projects which may not be endorsed by "peer groups."

19. With relatively few exceptions, major voluntary health agencies have tended to support research programs which parallel those funded with Federal dollars and to support many of the same investigators who receive Federal grants rather than assuming unique roles of independent initiative. Some who review the allocation of voluntary health agency grants also review the allocation of Federal support grants. Some voluntary health agencies have tended to overlook or ignore their roles as independent critics of Federal programs, as innovators, and as risk takers. Voluntary health agencies can make unique contributions in each of these areas.

IV

The fourth charge to the Commission was to determine "the scope of Federal medical research support and the mechanisms used." As this charge is informational, it is covered in the supporting body of this report.

V

The fifth charge to the Commission was to make such further conclusions . . . which the Commission shall deem advisable for inclusion in this report.

20. The best interests of science and medicine and of the public generally would be served by maintaining a pluralistic support of biomedical research. That is, there should be a diversity of sources of support with a diversity of judgments entering into the allocation of support. Thereby, institutions are more likely to retain their independent identity and their freedom of judgment.

21. Progress in the development of new agents for the diagnosis, prevention and treatment of disease is, we believe, hampered by current Federal patent policy. The problem arises because pharmaceutical companies, universities, and others are in danger of losing all of their investments and ensuing patent rights if and when use, however nominal, of Federal funds can be traced into the discovery or development of a new product. To protect their interests, sources of nongovernmental research have been tending to avoid the normal interplay of their scientists with Federally supported academic scientists.

SUMMARY OF RECOMMENDATIONS

In light of the foregoing and in response to the Board's fifth charge to make "such further conclusions and recommendations [as] the Commission shall deem advisable," the Commission makes the following recommendations to the Board of Trustees:

1. The American Medical Association should support in general the Federal biomedical research program. However, because in the public mind research tends to become enshrouded in such an aura of divinity as to exclude critical discussion and analysis of all that is advanced in its name, the AMA has an obligation to the public and to the medical profession to question any facet of the Federal biomedical research program which it may believe to be ill-advised or which it be-

lieves to be in need of constructive counsel.

2. The programs of the National Institutes of Health should be recognized for their contributions to the national biomedical research effort.

3. The Council on Medical Education of the AMA, in cooperation with other interested organizations, should be asked to make additional and progressive studies on the effects of research grants on teaching in medical schools. It should seek and recommend means for providing enhanced status and rewards for excellence in teaching.

4. The AMA should support responsible action designed to make available, to selected schools of good potential which have not developed adequate research establishments, special "development" funds to initiate or enlarge their research programs. These grants should also foster better geographical distribution of "centers of research excellence" among medical schools and universities.

5. The AMA should urge that the purpose of grants be identified precisely so that the Congress and the nation may know, with reasonable certainty, what is being supported, as a basis for future decision making.

6. To strengthen the review mechanism, membership on NIH study sections should provide for a sufficient rotation to ensure continuous infusion of new blood and to prevent the development of a monolithic, elite, decision-making "establishment." The same principles of rotation should apply to the Advisory Councils of the NIH. While due attention should be given to such factors as geographic distribution, the main consideration in appointing members to the Advisory Councils should be professional attainment and eminence of judgment.

7. A new statutory mechanism of overall review and counsel, in an advisory relationship to the director of the National Institutes of Health, should be established in order to assist in overall program planning and to provide additional checks and balances on program decisions. Membership on this advisory group should consist of men and women of demonstrated professional eminence and judgment.* We believe the advisory body should have independent status, under law, to assure that its recommedations and actions will have their intended impact regardless of changes in administrative leadership.

8. Accountability for disbursement of public funds should be maintained, but this accountability should depend primarily on strengthening of the administrative capabilities of educational institutions.

9. The AMA should urge and support legislation providing for Federal reimbursement of all allocable institutional costs of research projects authorized and funded by the Federal Government.

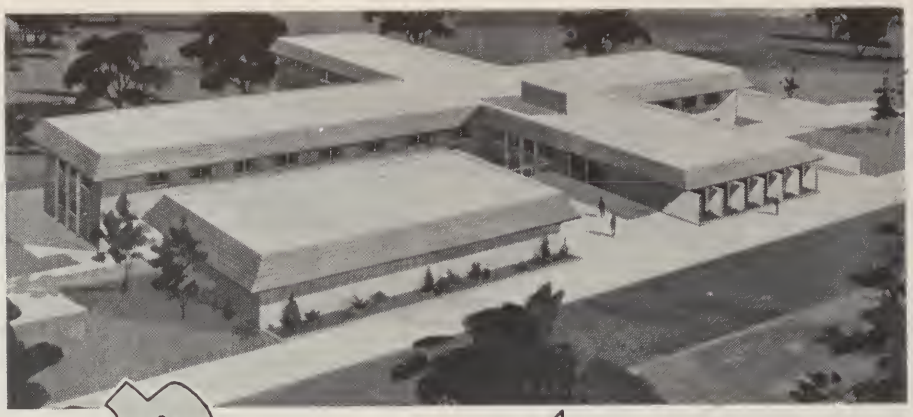
10. The AMA should urge and support legislation and administrative action designed to shift more decision-making responsibility for biomedical research from NIH to participating research institutions. To this end, increased use of the "institutional grant" and of the "program grant" should be actively supported. Developments relating to, or affecting, the mix of institutional, program and project grants to academic institutions should be carefully and continuously studied and analyzed for future guidance.

11. The AMA, in cooperation with other interested organizations, should conduct workshops and seminars of academic and medical school leaders and of those Federal administrators who grant and administer Federal research funds, to review mutual responsibilities and relationships, to conduct discussions of developing problems, and to develop new techniques for the better use and management of the vast Federal funds now being made available.

12. Because of the rapid changes which are occurring in the organization of medical practice and the financing of health care, research in the delivery of health care is of great importance and should be encouraged, provided it is conducted under proper auspices in accordance with sound research design and methodology.

13. The imbalance between biomedical research and education caused by the heavy, but desirable, Federal support of research, should be corrected by supporting measures that will materially increase both private and public funds for the support of the educational programs of the medical schools. First, among these measures, a more liberal income tax treatment should be allowed to the donors of private funds for medical education, to create increased incentives for them to contribute to medical education. Second, there should be allotted a greatly increased amount for operational expenses of medical schools, to be matched by those schools through private or local governmental sources. Every effort should be made to keep the Federal contribution on a supplemental basis, and the AMA should not support legislation that fails to do so.

14. The basic principles presented by the pharmaceutical industry on June 1, 1965, before the Subcommittee on Patents of the Senate Judiciary Committee, should be endorsed, namely:



a. Provision should be made, in substantially every case, for the grant or license of exclusive rights in a scientific medical discovery to some industrial concern to assure that drug inventions, even if resulting in some part from Government-financed research, are really developed and made commercially available to the people.

b. When Government funds have solely or primarily developed the invention, it is equitable and rational for the Government to hold the proprietary rights to the invention and to receive reasonable royalties from a licensee, or from licensees, who will manufacture and commercially market the invention.

c. Where Government funds did not solely or primarily produce discovery and development of the invention, the cooperating contractor-developer alone should have the proprietary rights in the invention.

15. The Board of Trustees should provide for a continuing watch and review of developments in the areas studied by its Commission on Research.

*The Commission notes that the director of the NIH has, subsequent to the first drafting of this recommendation, created such an advisory body by administrative action. The Commission commends the director for this move.

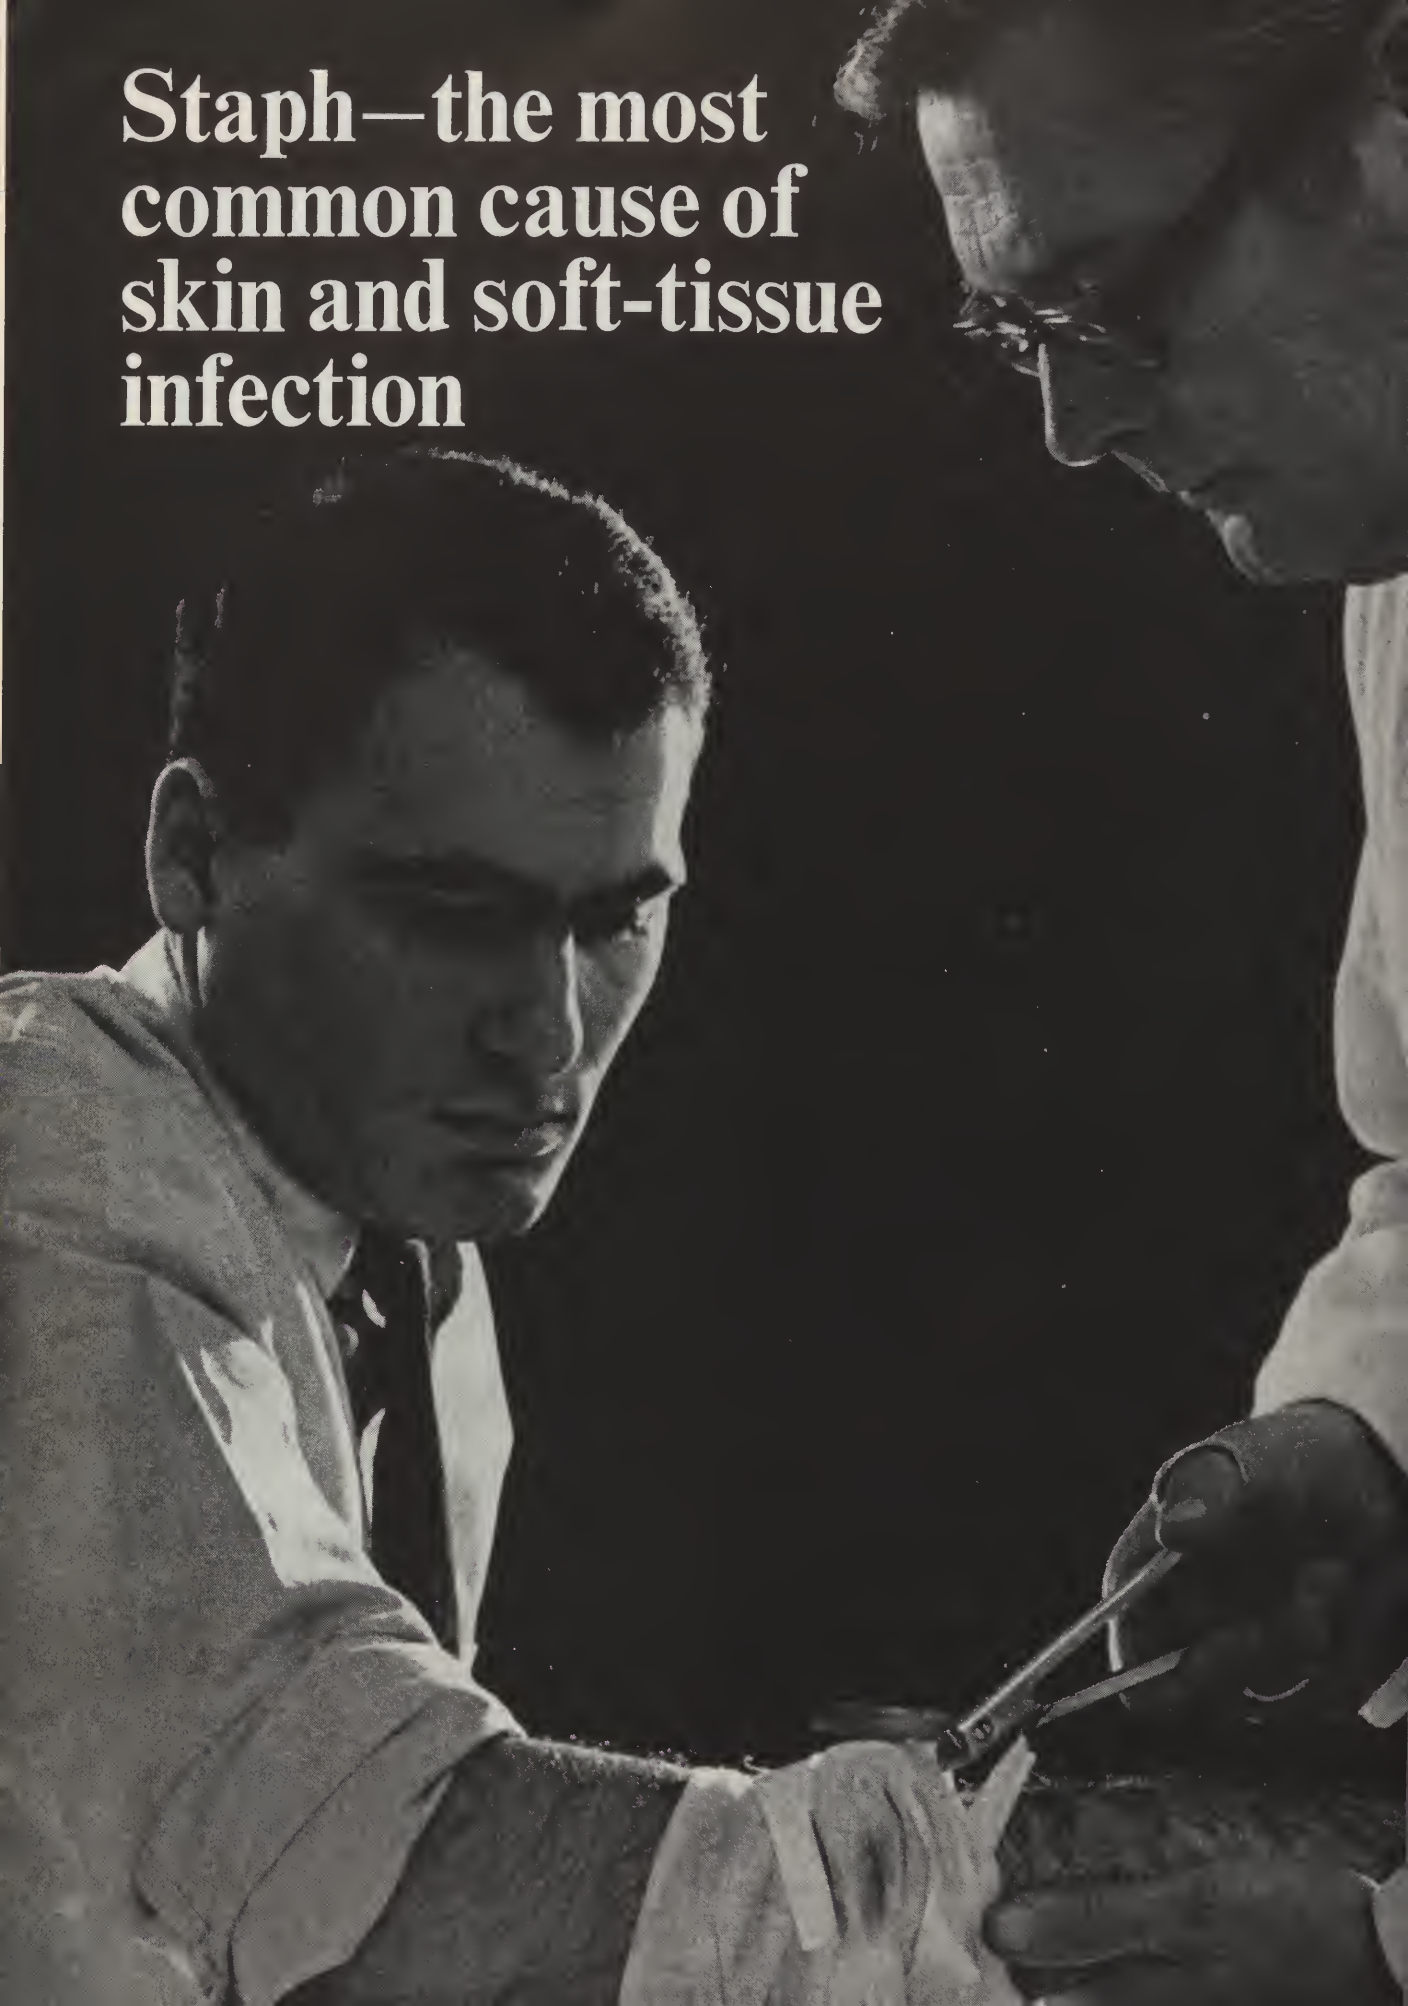
"All Otolaryngologists are Alike"

Just look at them and you can see how much they have in common. Besides, they all go through pretty much the same training, and pass the same kinds of tests, and measure up to the same sort of standards. Therefore, all otolaryngologists are alike. Right?

Wrong! But that's no more preposterous than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more exacting. In fact, there are at least nine *specific differences* involving moisture content, purity, potency and speed of tablet disintegration, which make the manufacture of Bayer® Aspirin so different.

These Bayer standards result in significant product benefits, including gentleness to the stomach and product stability, that enable Bayer Aspirin tablets to *stay* strong and gentle until they are taken.



So next time you hear someone say that *all* aspirin tablets are alike, you can say, with confidence, that "it just isn't so."

You might also say that all otolaryngologists aren't alike, either.

Staph—the most common cause of skin and soft-tissue infection

.reliably controlled with specific therapy

A suitable dosage form for every staph situation

Staph—the most common cause of skin and soft-tissue infection—also is responsible for many more serious infections, such as pneumonia, osteomyelitis, and septicemia. Often, a seemingly minor skin infection is the source of metastatic spread to deeper structures. When findings on culture incriminate staph as the cause, Prostaphlin (sodium oxacillin) will provide specific effective therapy.

Bactericidal effectiveness. Hardly a staph organism can resist the bactericidal action of Prostaphlin (sodium oxacillin), as shown by a 34-month *in vitro* study. Of all staph isolates tested, 99.5% were sensitive to oxacillin.[1]

Clinically proven. There is a high correlation between these *in vitro* findings and clinical results. Of 610 patients treated with Prostaphlin (sodium oxacillin), 89.8% were reported cured or improved, including those with staph infections resistant to penicillin G.[2] And since resistance does not appear to develop *in vivo,* therapy with oxacillin can be extended when necessary.

Outstanding safety record. Besides being staph-specific and rapidly absorbed—Prostaphlin (sodium oxacillin) has established an outstanding record of safety during five years of widespread clinical use. Continuous high blood levels of oxacillin have not produced toxic effects on kidney function, assuring a significant margin of safety. However, as with all penicillins, the possibility of allergic response should be considered.

Capsules, Oral Solution and Injectable. Prostaphlin (sodium oxacillin) is available in three flexible dosage forms to suit the age of the patient and severity of infection—capsules, an oral solution for pediatric use, and multi-dose vials for injection, I.M. or I.V.

PRESCRIBING INFORMATION: For complete information, consult Official Package Circular. *Indications:* Infections caused by Staphylococci, particularly those due to penicillin G-resistant Staphylococci. *Contraindications:* A history of severe allergic reactions to penicillin. *Precautions:* Typical penicillin-allergic reactions may occur. Safety for use in pregnancy and premature infants is not established. Because of limited experience, use cautiously and evaluate organ system function frequently in neonates. Mycotic or bacterial superinfections may occur. Assess renal, hematopoietic and hepatic function intermittently during long-term therapy. *Adverse Reactions:* Skin rashes, pruritus, urticaria, eosinophilia, nausea, vomiting, diarrhea, fever and occasional anaphylaxis. Rare cases of reversible hepatocellular dysfunction have occurred. Moderate SGOT elevations have been noted. Thrombophlebitis has occurred occasionally during intravenous therapy and leukopenia was noted in two cases. *Usual Oral Dosage:* Adults: 500 mg. *q.*4 or *q.*6*h.* Children: 50 mg./Kg./day. *Usual Parenteral Dosage:* Adults: 250-500 mg. *q.*4 or *q.*6*h.* Children: 50 mg./Kg./day. Treat beta-hemolytic streptococcal infections for at least 10 days. Give oral drug 1 to 2 hours before meals. *Supplied:* Capsules—250 and 500 mg. in bottles of 48. Injectable—250 mg., 500 mg., and 1 Gm. dry filled vial for I.M./I.V. use. For Oral Solution—100 ml. bottle, 250 mg./5 ml. when reconstituted. **A.H.F.S. CATEGORY: 8:12.6**

solves your billing and collection problems

- Touch-tone card dialer transmits service and fee data quickly, easily
- Consolidated handles all billing and collection
- Physician receives payment in full within one week
- Moderate service charge

A complete billing service

Consolidated Services is a centralized billing and collection service which places the physician on an immediate cash basis. Using a touch-tone dialer and prepunched data cards (supplied by Consolidated) your record of patients, services, and fees is transmitted in seconds. Consolidated does the rest, and remits fees in full to the physician (less a modest discount) within one week from billing date.

How the physician benefits

The physician is relieved of all billing and collection, stationery, postage and clerical costs. AND accounts receivable are turned into immediate cash!

Optional payment plans

Five payment plans are available to physician and patient, including: Straight billing, 90-day payment at no extra charge to patient. . . .

You have a choice of Billing
On Your Personal Billheads
Or
On Group Billheads

Modest cost

Consolidated applies a basic service charge of only 5% to 7% dependent upon size and volume of practice. No cost for equipment, supplies, reports, etc.

Physicians' Placement Service

When the rapidly approaching end of World War II loomed on the horizon in 1944, physicians on the home front foresaw the imperative need to establish an organized program to help their military counterparts return to civilian practice.

So, in December of that year, the House of Delegates of the American Medical Association established a Bureau of Information to "assist returning medical officers in their educational, licensure and placement problems."

Since the Bureau had been envisioned only as a temporary project, it was abolished in November, 1947, because it was logically assumed that its purpose—relocation of medical officers—had by then been largely accomplished. Its work was transferred to the Council on Medical Service until the "tapering off" process of service requests was completed.

But the requests never stopped. The war, directly or indirectly, had spurred profound changes. The wartime interruption of their medical practices gave medical officers an opportunity to think out their futures. It opened their eyes to new challenges and opportunities. Many physicians chose to capitalize on the chance to continue their medical education and enter specialty training.

Population patterns were changing. Some physicians took this as their cue to search for more attractive locations in which to practice. Others decided they wanted to seek out opportunities in entirely different geographic locations which held personal appeal for them. The unprecedented, uninterrupted period of post-war prosperity has served to multiply this mobility.

Consequently, the service originally performed as a temporary expedient by the Bureau of Information not only never stopped, but has mushroomed into a major, continuing AMA service to physicians, those seeking physicians and to the nation at large.

Established as the successor unit to the Bureau in 1948, the AMA Physicians' Placement Service has processed applications from 26,140 physicians seeking to be "placed," and registered 31,760 openings during its 18 years of existence. The service is provided without any charge or obligation.

Indicative of the increasingly significant role being played by PPS on a national level is the fact that it had 3,196 openings registered and 2,750 physician registrants in 1966. Back in 1948 it had a mere 200 openings and three times that number of registrants.

The AMA Physicians' Placement Service works closely with all state medical societies, about two-thirds of which have ongoing placement programs, and also with county medical societies that have such programs. It exchanges information with them on registrant applications and practice opportunities of mutual interest.

But its dominant role and its chief reason for existence lie in bringing together physicians and opportunities that are in different states or geographic areas.

Strictly speaking, the AMA Physicians' Placement Service is not a "placement" service at all. Its job is to supply information to applicants and those listing openings in an attempt to match their respective needs—to help find the "right" physician for the "right" location or position. Once brought together, two interested parties then seek to work out mutually satisfactory arrangements.

As a matter of fact, PPS cannot gauge with any reasonable degree of accuracy how many physicians it has helped to "place." While it is interested in knowing the answer, the information often is not made available since a good many registrants do not report their final status. The number of "placements" is, however, believed to be substantial.

A "bonus" effect of the service is that regis-

One of a series of feature articles prepared exclusively for state and county medical society journals and bulletins by the American Medical Association to describe AMA services for physicians.

CREATE THE PROPER PROFESSIONAL IMAGE

ACCREDITED SURGICAL COMPANY

MEDICAL AND SURGICAL SUPPLIES

8705 COLESVILLE RD. SILVER SPRING, MD. 20910 PHONE 585-7711

trants pass along the word about openings to other physicians who they think may be interested in a particular opportunity. Placements frequently result from these word-of-mouth contacts. Even more frequently, registrants are led to other opportunities they find more attractive as the result of PPS-originated contacts.

In January, for example, a former general practitioner who had gone on to complete his residency in anesthesiology reported that he had decided to accept a position in either Indianapolis or a city in northern Michigan. Although neither position was listed with PPS, he pointed out that he had learned of both opportunities through contacts it had produced.

Many openings are filled rapidly. Some, however, take considerable time.

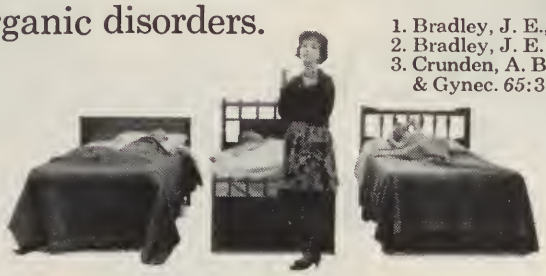
A physician from Minot, ND, for example, searched for nearly a year and a half, traveling considerably in the process, before he found the man having the very special qualifications required to work with him in a "loose association" arrangement. Needed was a cardiologist with extensive sub-specialty training in cardio-pulmonary diseases. Outstanding new facilities were available for conducting work in this area. Precisely filling the bill was a cardiologist who had just completed his military obligation. His background included five years of the sub-specialty training required.

"I never dreamed I'd wind up in North Dakota," the new associate said. "It was the furthest place from my mind, but the opportunity—the new facilities, the nature of the practice and the arrangements—met my needs perfectly."

Although PPS is but one of several sources utilized in finding physicians, some employers have experienced their best "outside" results with it.

Said the procurement director of a well-established Wisconsin clinic with several branch offices:

> "In 1966, 14 physicians signed contracts with us. Four of these were referred by the AMA Physicians' Placement Service. Your placement service was the only one of real value. We reached all the other new associates either through classified ads or personal contacts."



The emphasis of PPS activities is on private

Togetherness....

...can be rough when epidemics of nausea and vomiting strike a family. Emetrol offers prompt, safe relief. It is free from toxicity[1] or side effects[2,3] and will not mask symptoms of serious organic disorders.

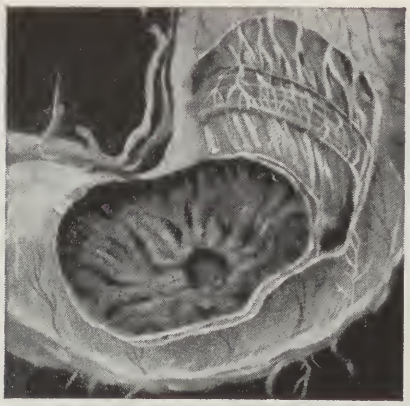
practice—solo, partnership, group, clinic or association—but it is becoming increasingly involved in other areas, exclusive of the teaching and research fields, in which openings are few and are best handled by direct personal contact or by word of mouth. In 1966, there were 215 openings listed in industrial, institutional, public health or school or college health positions.

Occasional requests are received concerning practice opportunities outside the US, but such openings exist almost exclusively in underdeveloped countries in Africa, Asia and Latin America. Currently, about 90 such openings, including five in Viet Nam, are listed by governmental agencies, private and denominational missionary groups, and industries.

While PPS lends assistance to physicians of all ages and interests, much of its activity centers upon those seeking their first place to practice. Last year more than 300 applicants made personal visits to the AMA headquarters to discuss opportunities to practice or physician manpower needs.



"Approximately 70% of physicians registering with us are looking for their first position," pointed out Mrs. Ann Johnson, director of the service. "They are either just completing internship or residency training, or completing military service."

Under a brand new program to be initiatied by mid-year, the Physicians' Placement Service will concentrate upon finding places to practice—full- or part-time—for physicians who have not recently been engaged in active practice. These will include older physicians who have been retired, women physicians who temporarily have abandoned medical practice, and physicians who have been engaged in other areas of work.

The mechanics of the Physicians' Placement Service are relatively simple. Each applicant is asked to fill out a brief questionnaire, on which he is to list his background, education, training, personal history and references, the type of position sought and the state or geographical area preferred.

A similar form is completed by those listing opportunities to practice. This contains such pertinent information as the type of community, type of specialty training required, type of practice, any age and special requirements, financial arrangements, whether there is an opportunity for

In peptic ulcer... antacid therapy with a new benefit

CONTAINS A BALANCED COMBINATION OF THE MOST WIDELY USED ANTACIDS— FOR RAPID NEUTRALIZATION. PLUS SIMETHICONE— TO CONTROL THE FACTOR WHICH ANTACIDS ALONE CANNOT INFLUENCE.

Mylanta®

- In Mylanta, aluminum and magnesium hydroxides are balanced to minimize the chance of constipation or laxation and still achieve rapid acid neutralization and pain relief.
- The positive action of simethicone helps relieve the painful gas symptoms which often accompany the peptic ulcer syndrome.
- The nonfatiguing flavor and smooth, nongritty consistency of tablets and liquid encourage continued patient cooperation during long-term therapy.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) of liquid contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. **Dosage:** one or two tablets, well chewed or allowed to dissolve in the mouth, or one or two teaspoonfuls of liquid to be taken between meals and at bedtime.

partnership, available hospital facilities, type of schools available and what type of office space is available.

Each applicant is asked whether he wants a position in his home state only, in different states in the immediate home region, in the home *or* a new region, in a new region only, or has no preference. Geographic regions are divided into six categories—New England and Middle Atlantic, South, Midwest, Southwest, Mountain States, and Pacific States.

Let's assume, for instance, that you are an internist in solo practice in Chicago, but would like to enter group practice in one of the Mountain States because you and your family enjoy the climate, are avid outdoor enthusiasts and feel that you would prefer a relaxed way of life that you are likely to find in this geographic area. You desire a location in a city of 25,000- 100,000 population and specify that it must have a church of your faith. You also specify what compensation you expect to receive.

In filling out your application, you find that PPS will circulate your resume on a blind basis since you prefer to remain unidentified.

Unless you have specified otherwise, a copy of your coded application will automatically be sent to each of the state medical association placement services in this geographic region.

Shortly thereafter, you will receive from PPS a list of all current openings for internists. You also will be advised that PPS will forward a copy of your coded resume to all individuals, groups and communities having openings meeting your spec-

ifications.

PPS then will forward you any letters from interested parties. If a position interests you, it is up to you to follow up by initiating contact. PPS has then fulfilled its role as intermediary by supplying both interested parties with information. It will, however, continue to send you descriptions of new openings until you advise that you have either accepted a position or are no longer interested in relocating.

In addition to the placement service, PPS also helps the practicing physician by providing carefully researched information to serve as a guide in planning physicians' medical facilities and managing medical practice. It also provides communities with information about the Community Medical Assistance Program for rural communities, a plan carried out cooperatively by the AMA and Sears-Roebuck Foundation.

If you ever consider relocating or entering a different type of practice, are looking for a prospective partner, associate or an additional physician for your community, or are thinking about building new office facilities or modernizing present ones, you will certainly find it advantageous to find what the AMA Physicians' Placement Service has to offer. And if you hear of someone who is "looking," you may do him a big favor by referring him to PPS.

Publications List

The following publications, describing various services provided by the PPS, may be obtained free of charge by writing to Physicians' Placement Service, American Medical Association, 535 North Dearborn Street, Chicago, Ill. 60610.

Finding a Place to Practice—an eight-page pamphlet describing the Physicians' Placement Service and outlining sources and factors to be considered in choosing a place to practice or relocate.

The Business Side of Medical Practice—a 56-page brochure containing detailed information covering the business aspects of conducting medical practice.

A Planning Guide for Physicians' Medical Facilities—a 54-page brochure containing valuable guides for established physicians seeking to build or modernize medical facilities.

The Sears-Roebuck Foundation Medical Cen-

ter—a four-page pamphlet describing (1) architectural plans for a rural medical building and (2) the Community Medical Assistance Program.

What Do You Know About Physicians' Placement Service?—a four-page pamphlet.

A Doctor For Your Community—a 19-page pamphlet providing guidelines for communities to follow when undertaking to procure a physician.

Immunization Campaign

Probably more than two million American youngsters suffered measles during 1966. This still-common childhood disease that should now be uncommon causes about 500 deaths a year, leaves many of its victims with deafness or mental defects and triggers secondary diseases such as pneumonia and encephalitis.

Yet all of these cases could have been prevented through the use of safe, effective measles vaccines, one of which has been available since the spring of 1963.

The same is true of the 300 cases of tetanus, 164 cases of diphtheria and the 72 cases of polio which were reported in 1965 by the US Public Health Service. These three diseases, a year earlier, caused 238 deaths.

That's why the American Medical Association has called upon the nation's medical societies and individual physicians to lead the battle to eradicate these easily preventable diseases by conducting intensive local immunization campaigns in cooperation with public health departments, specialty societies, health agencies and health educators.

To encourage such local efforts, the AMA, through its Task Force on Health Education to Promote Immunization, has developed a comprehensive kit of basic communications materials and guidelines designed to serve as the backbone for whatever type of immunization program is deemed desirable locally.

One of these kits, each containing approximately 25 basic communications tools ranging from a letter to mothers (in pamphlet form) to materials created for use in the mass media, was sent in March to executive secretaries and secretaries of the nearly 2,000 state and local medical societies.

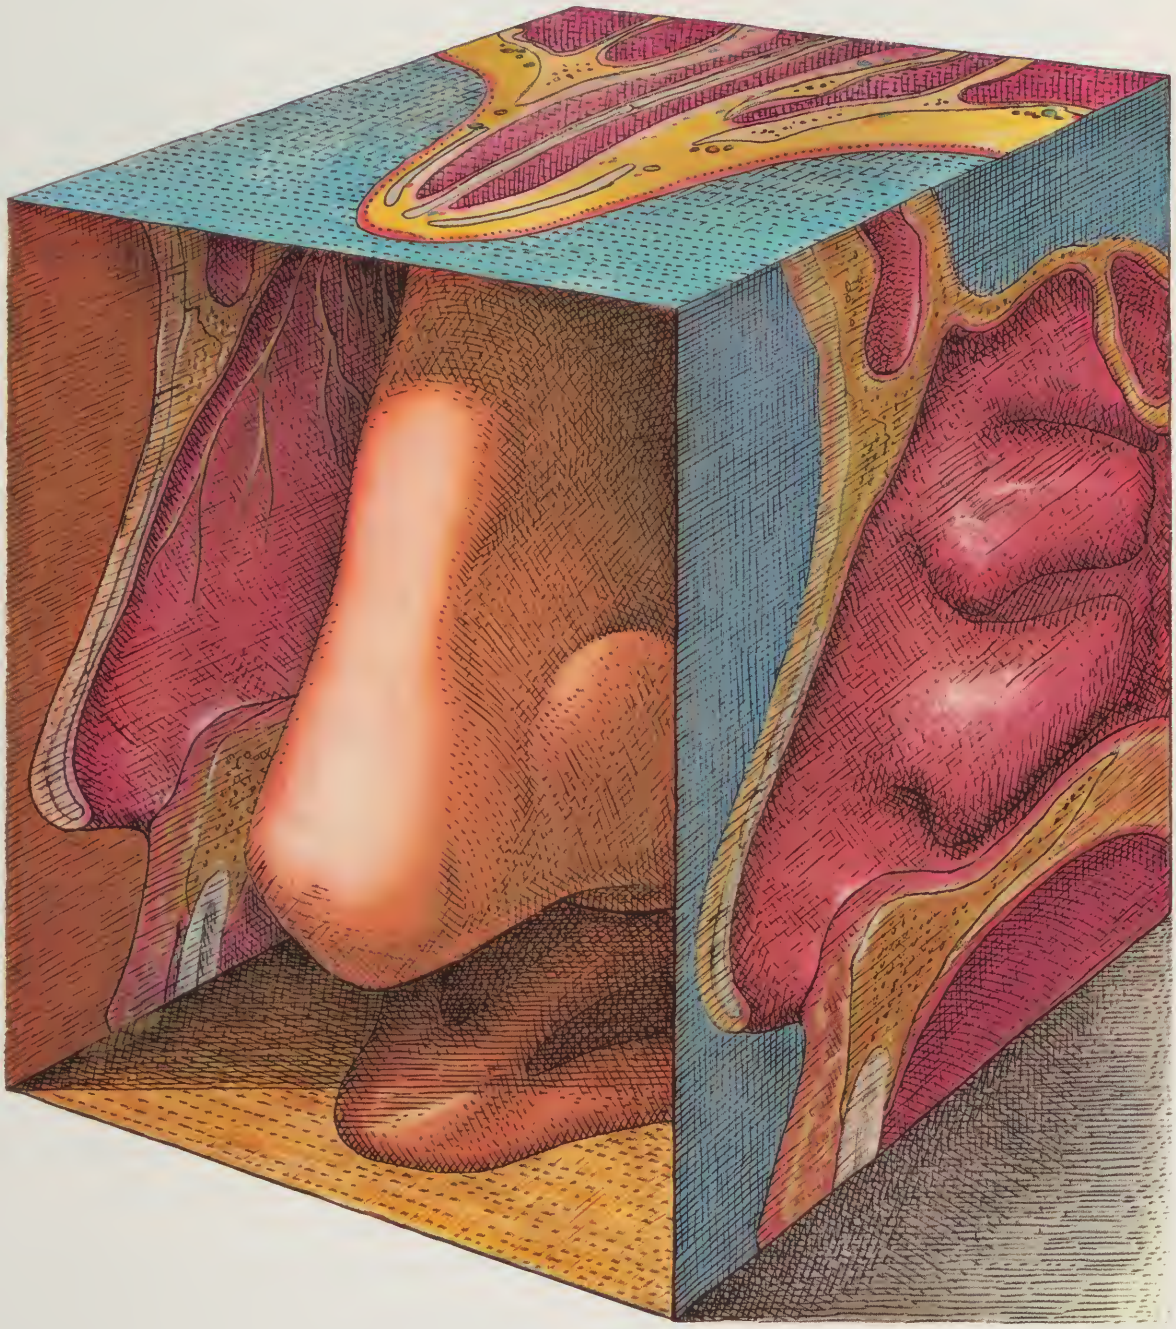
The AMA has paved the way for local campaigns by issuing timely releases on immunization needs to newspapers across the nation and by providing spot announcements to more than 500 television stations and approximately 2,000 radio stations.



Materials contained in the kit are keyed toward encouraging individuals to obtain immunization from their personal physician, but can also be adapted by local medical societies wishing to conduct promotions of other types. Physicians officially designated to organize local programs can obtain a kit by writing the Health Education Department, American Medical Association, 535 North Dearborn Street, Chicago, Ill. 60610.

Campaign materials in the kit were developed by members of 14 AMA departments and four AMA divisions at the direction of the Council on Environmental and Public Health and as a direct outgrowth of the AMA Symposium on Immunization held at Atlanta last October in cooperation

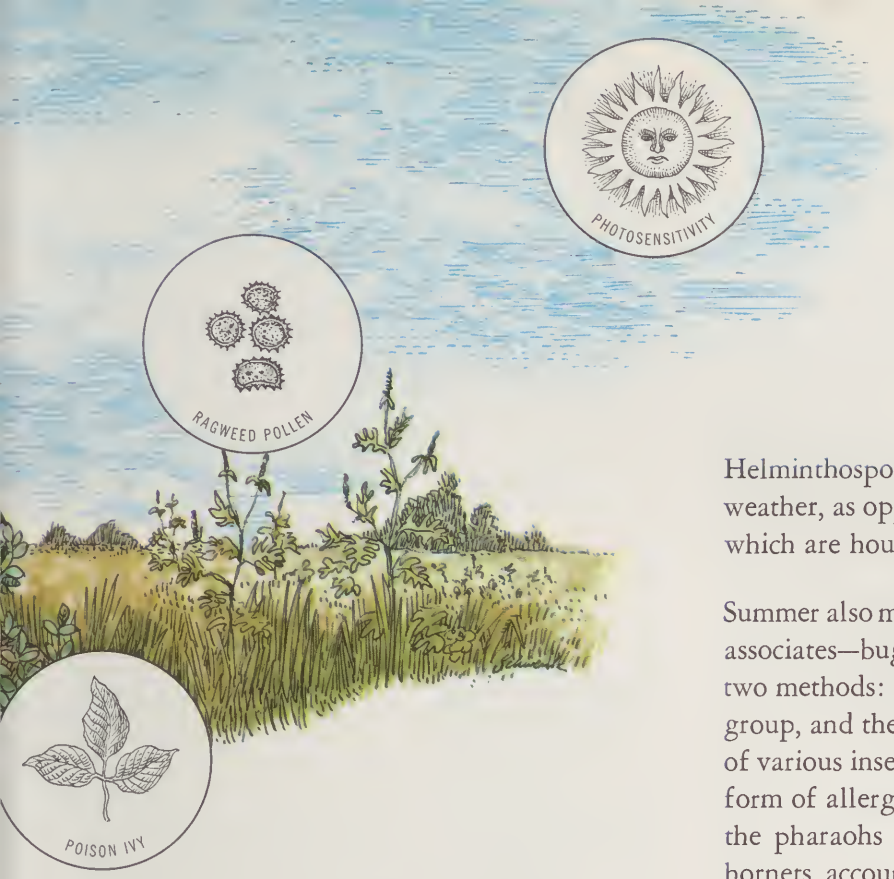
DORSEY Season

A journal within a journal published quarterly in the interests of better medicine by Dorsey Laboratories, a division of The Wander Company, Lincoln, Nebraska. Address communications to Raymond C. Pogge, M.D., Director of Medicine.

this issue: the ubiquitous world of summer allergies

the ubiquitous world of summer allergies

Donald L. Unger, M.D. • Clinical Assistant Professor, Department of Medicine (Allergy), Stritch School of Medicine (Loyola).



In the Spring a young man's fancy lightly turns to thoughts of—allergies. This is at least true of the 10% of the population who have hay fever and the 4% who have asthma.[1] The snow melts, the trees blossom and the noses run. Patients who were fine all winter may not be enthralled by the sight of the first robin or the blossoming of a crocus, for their appearances may precede the "sneezin' season."

Allergies in general can be divided into winter allergies and summer allergies. In the winter the main problems are inside the house: e.g. dogs, cats, dust and feathers. Houses in the northern half of the country become so dry that it becomes essential to add humidity to the home; this is a far cry from the damp summer months with the moldy basements and need for dehumidifiers.

Early in April trees begin to pollinate, with each tree having about a two week period of pollination. A particular patient may be sensitive to only one tree and thus have his hay fever for such a short time that he thinks he has a cold.[2] The entire tree season starts about April 1 and ends about Memorial Day, although all hay fever seasons are blurred and prolonged in the southern part of the country. Tree pollen is usually very heavy and a person may well have most of his exposure from those trees immediately surrounding his home.

Grasses pollinate from about May 15 until July 4, and cause "rose fever." Grass pollens are somewhat lighter and more buoyant than tree pollens, and are much more ubiquitous. While there are several varieties of grasses in the United States, they are so closely related antigenically that a person sensitive to one is generally sensitive to them all.[3] Thus, while the tree season is really several small seasons intertwined, the grass season will usually result in symptoms for a more prolonged period. Obviously, a grass-sensitive patient will have trouble only when grass is pollinating—he will have to think of another excuse not to mow the lawn after July 4.

Ragweed is the "Big Daddy" of them all in the eastern two-thirds of the country. Pollination is generally from mid-August until the end of September, with the predicted lower counts and longer seasons

in the southern part of the country. Ragweed is a very light pollen which may be windborne for hundreds of miles. An interesting study was made in New York City, in which 90% or more of the ragweed plants were destroyed in three of the five boroughs; pollen counts done during the season were virtually identical in all five.[4]

Ragweed is, of course, the most common cause of hay fever and is associated with an incredible loss of man hours from work each year. Many is the patient who travels to areas where the pollen count is low, just to avoid having symptoms. There is no ragweed anywhere in the world except the United States and portions of Canada and Mexico.

While molds are present through the year, the most important ones predominate from April until November. An old wives' tale has ragweed ending with the first frost, when actually it ends a good month earlier. It is Alternaria—the kingpin of the molds—that meets a sudden demise with the first frost. Alternaria-sensitive patients are in their glory when there is snow on the ground, and might be ideally suited to man the radar stations in Alaska. In September and October, Alternaria counts are at their highest, perhaps associated with the burning of leaves. Other molds such as Hormodendrum and Helminthosporium are associated with the warmer weather, as opposed to Penicillium and Aspergillus which are household molds.

Summer also means the return of our much maligned associates—bugs. Insects cause allergic symptoms by two methods: the bite or sting of the Hymenoptera group, and the inhalation of particles of the bodies of various insects. Wasp stings are the oldest known form of allergy, as they caused the death of one of the pharaohs in ancient Egypt.[5] Bees, wasps and hornets account for many deaths in this country, and those sensitive to them should carry special treatment kits at all times; a few minutes delay in the administration of epinephrine to such a patient, might be the difference between life and death. Inhalation of particles of insects may cause sneezing and wheezing in a susceptible individual.[6] Both of these forms of insect allergy may be benefitted by hyposensitization.

The insect recognizes no professional bounds. He is as apt to bite the physician as the patient. So this season, beware of bugs. And beware, too, of poison ivy. That pleasant stroll through the woods and underbrush with the Boy Scouts might turn into a

(Advertisement)

nightmare for the botanically uninitiated in the causes of rhus dermatitis (poison ivy, poison oak and poison sumac). Although you may have been careful, your dog may not have noted that it wasn't clover he jumped through, but poison ivy. His return to your side may give you the rhus dermatitis that you so carefully avoided. That heavenly campfire may be emitting particles of rhus oil to produce an airborne contact dermatitis of the exposed areas of the body.

Another fascinating, but rather infrequent type of summer allergy is physical allergy. Some people sneeze on exposure to sunlight, while others break out in rashes, usually on the exposed parts of the body. These rashes may well follow the administration of various photosensitizing drugs, e.g. demethylchlortetracycline.[7] Another form of physical allergy and one that may be lethal in the summer, is cold allergy. Yes, I mean cold allergy, not heat allergy. The cool dip on a hot day with its consequent sudden chilling of the body, may be the coup de grace for a cold sensitive patient.[8] It is customary to write "heart attack" on the death certificate, even though the victim may have been an 18-year-old boy who looks like a Greek god.

Lest the reader be depressed by this saga of afflictions associated with the warmer months, perhaps he should remember that it is also a time for swimming, baseball, lying in the sun and taking that long-planned vacation. So let's all join in a chorus of "In the Good Old Summertime," as we sneeze, wheeze and scratch. Be careful of your suntan lotion, however; it may cause you a contact dermatitis.

with the Communicable Disease Center, USPHS.

Promotion of immunization has been a continuing part of the AMA's health education program. Campaigns aimed at thwarting polio, smallpox and tetanus were forerunners of the current, broad-based program.

"While the major thrust of the new campaign is aimed at immunization against measles," said Fred V. Hein, MD, director of the AMA's Health Education Department, "we must not relax our efforts against other diseases preventable by immunization."

Dr. Hein noted that the means are available not only to eradicate measles in the foreseeable future, but also to eliminate the deaths from tetanus that occur each year, to prevent the outbreaks of diphtheria and polio that crop up from time to time, and to bring other communicable diseases under better control.

Measles is still a universal illness. Approximately 90% of the adult population in the US has had measles; but, because of its prevalence, a general apathy to the disease has arisen. Yet its side effects and complications make measles more serious than the general public realizes. An average of one death occurs in every 10,000 cases.

With the licensing of three different measles vaccines in the past four years, some inroads have been made. The number of cases reported to the USPHS, which estimates that only about 10% of the actual number of cases are reported, dropped from 458,083 in 1964 to 202,886 in 1966. The figure was a 21-year low.

H. Bruce Dull, MD, assistant chief of the Communicable Disease Center in Atlanta, estimates that from 18 to 20 million measles-susceptible children have been vaccinated in the past four years as the result of "excellent performances" by the medical profession and state and local health departments.

Among the concentrated efforts carried out by medical societies last year were a statewide "End measles once and for all" campaign conducted by the Rhode Island Medical Society and similar programs conducted by medical societies and other members of the health team in metropolitan Pittsburgh and Detroit. In the special Rhode Island campaign 34,458 children (66.9% of the measles-susceptible population) were immunized. In Detroit more than 171,000 children were immunized, and in Pittsburgh 52,241.

As Dr. Dull points out, however, only about 45% of susceptible children (ages 1 through 8) have so far been immunized.

Still to be protected are approximately the remaining 55%—six million youngsters who will enter kindergarten or grades one and two this year and an estimated four million more who will reach age one during 1967.

Chief objectives of immunization programs urged by the AMA are:

1. Acquaint the public with available immunizations, their values and at what times in life they should be obtained.

2. Encourage people to seek immunization according to recommended schedules.

3. Encourage physicians to step up their efforts to maintain a high level of immunization among their patients.

AMA Publications Available

Facts on Quacks, a complete source book touching every aspect of health quackery, is now off the presses, the American Medical Association has announced.

In development for 18 months, the new publication is considered a major instrument in the AMA's program of alerting the public to the evils of quackery. A 32-page, two-color, illustrated booklet, it is written in question and answer form, covers facts on health quackery in such fields as arthritis and rheumatism, cancer, nutrition and weight reduction, over-the-counter drugs, alcoholic nostrums, health books and pamphlets, epilepsy, mental health and retardation, cosmetics, baldness, rejuvenation and sex stimulants. One section advises the reader what he should do if he suspects health quackery activities in his community.

"Never before has there been any book like this," Doyl Taylor, director of the AMA Department of Investigation, says. "It should be placed in every reference library in the country and certainly in every medical library . . . individual physicians should place copies in their waiting rooms."

Facts on Quacks is being published by the AMA in full cooperation with such governmental and voluntary agencies in the health field as the

National Health Council, the Food and Drug Administration, the National Better Business Bureau, the Post Office Department, the Federal Trade Commission, the American Cancer Society, Inc., and The Arthritis Foundation.

Requests for the booklet should be directed to the Order Department, AMA 535 North Dearborn Street, Chicago, Ill. 60610. Single copies, 30¢; 50-99, 28¢; 100-499, 25¢; 500-999, 23¢; 1,000 and over, 20¢.

Obtainable from the same source is another new AMA publication, *The Look You Like*, a 129-page paperback with information on the use and abuse of cosmetic preparations gleaned from the *Today's Health* question-and-answer column of the same name. Answers to all questions appearing in this column are written with the help of outside consultants in industry and the medical profession who are considered authorities on the question at hand. Subject matter is reviewed by members of the Committee on Cutaneous Health and Cosmetics.

Retail sales of cosmetics are expected to surpass the $4 billion mark this year. Considering the extensive number of people who use cosmetics and the wide range they have to select from, it is readily apparent that occasional reactions to cosmetic programs will occur. The new book was prepared as a guide to help individuals avoid or overcome such problems.

Single copies are $1.70 in the US, its possessions, Canada and Mexico ($2 elsewhere). There is a special rate of 90¢ for medical students, interns and residents.

Cases on Anesthesia, a collection of court decisions relating to physican or hospital liability arising out of the administration of anesthesia, is now available to any physician upon request.

This most recent in a series of collections of cases, published by the Department of Legal Research, Law Division, AMA, covers such medical problems as contraindications, allergic reactions, intubation, explosions or burns and extravasation. Also included are legal topics such as

consent, vicarious liability and statute of limitations.

The tenth guide in the series *Guides to the Evaluation of Permanent Impairment,* developed by the Committee on Rating of Mental and Physical Impairment, is now available. Entitled *Guides to the Evaluation of Permanent Impairment—Mental Illness,* this guide, like, all the others in the series, has been designed primarily for use by physicians, but is of interest and use to all concerned with the medical, administrative, or judicial aspects of programs for the disabled.

The previously published guides in the series deal with the extremities and back; the visual system; the cardiovascular system; ear, nose, throat, and related structures; the central nervous system; the digestive system; the peripheral spinal nerves; the respiratory system; and the endocrine system.

A limited number of copies of the new guide may be obtained, without charge, upon written request to the Committee at 535 North Dearborn Street, Chicago, Ill. 60610.

Any medical society member interested in current legal developments affecting the medical profession may arrange to receive the semimonthly newsletter, *The Citation.* Published by the Law Division of the AMA, it is directed primarily to attorneys for medical societies, medical society executives and members of medicolegal committees, but many other physicians have been added to the mailing list at their request.

In the Jan 13, 1967 issue of *The Citation,* eight court decisions involving physician or hospital liability were reported as were 19 other court decisions on subjects such as licensure, hospital staff privileges, tax problems, osteopathy and fluoridation of public water supplies.

Personal requests for "The Citation" should be sent to the Law Division, AMA, 535 North Dearborn Street, Chicago, Ill. 60610.

Photo professionally posed

Mike expects a penicillin injection. He's about to be pleasantly surprised.

His physician is going to prescribe an oral penicillin —PEN•VEE® K (potassium phenoxymethyl penicillin). It's usually so rapidly and completely absorbed that therapeutic serum levels are produced in 15 to 30 minutes. Higher serum levels generally last longer than with oral penicillin G.

Indications: Infections due to pathogens susceptible to oral penicillin G. Prophylaxis of rheumatic fever in patients with previous history of the disease.

Precautions: Skin rash, symptoms resembling those of serum sickness, or other manifestations of penicillin-allergy may occur. Measures for treating anaphylaxis should be readily available: epinephrine, oxygen and pressor drugs for relief of immediate allergic reactions; antihistamines and corticosteroids for delayed effects. Penicillin may delay or prevent the appearance of primary syphilitic lesions. Patients with gonorrhea who are suspected of concurrent syphilitic infections should be tested serologically for at least 3 months. Where lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. As with other antibiotics overgrowth of nonsusceptible organisms may occur; if so, discontinue and take appropriate measures. Treat β-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent development of rheumatic fever or glomerulonephritis.

Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.

Composition: Tablets—125 mg. (200,000 units) and 250 mg., (400,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc. **Wyeth Laboratories Philadelphia, Pa.**

WILLIAM TAYLOR IS BIG ON FAD DIETS.

Bill knows all the latest schemes for losing weight.

He's a big loser.

He loses time. And money. And maybe even his best chance to do something sensible about his size.

Because like most faddists, Bill isn't building new habits. He'll simply bounce back to his old routine —and with every rebound make real weight control more difficult.

That's what started Project Weight Watch.

That's what prompted preparation of research-tested scientific diets which are offered to you free. They're a realistic balance of the 4 food groups—meat, bread and cereals, fruits and vegetables and dairy foods. They're diets that you'd write yourself, if you had the time.

Send for them. Help stamp out big Bills.

Send me the Project Weight Watch kit of materials including diets.

PROJECT WEIGHT WATCH
FACTS, NOT FADS

Posed by professional model.

You can't set her free. But you can help her feel less anxious.

You know this woman.

She's anxious, tense, irritable. She's felt this way for months.

Beset by the seemingly insurmountable problems of raising a young family, and confined to the home most of the time, her symptoms reflect a sense of inadequacy and isolation. Your reassurance and guidance may have helped some, but not enough.

SERAX (oxazepam) cannot change her environment, of course. But it can help relieve anxiety, tension, agitation and irritability, thus strengthening her ability to cope with day-to-day problems. Eventually—as she regains confidence and composure—your counsel may be all the support she needs.

Indicated in anxiety, tension, agitation, irritability, and anxiety associated with depression.

May be used in a broad range of patients, generally with considerable dosage flexibility.

Contraindications: History of previous hypersensitivity to oxazepam. Oxazepam is not indicated in psychoses.

Precautions: Hypotensive reactions are rare, but use with caution where complications could ensue from a fall in blood pressure, especially in the elderly. One patient exhibiting drug dependency by taking a chronic overdose developed upon cessation questionable withdrawal symptoms. Carefully supervise dose and amounts prescribed, especially for patients prone to overdose; excessive prolonged use in susceptible patients (alcoholics, ex-addicts, etc.) may result in dependence or habituation. Reduce dosage gradually after prolonged excessive dosage to avoid possible epileptiform seizures. Caution patients against driving or operating machinery until absence of drowsiness or dizziness is ascertained. Warn patients of possible reduction in alcohol tolerance. Safety for use in pregnancy has not been established.

Not indicated in children under 6 years; absolute dosage for 6 to 12 year-olds not established.

Side Effects: Therapy-interrupting side effects are rare. Transient mild drowsiness is common initially; if persistent, reduce dosage. Dizziness, vertigo and headache have also occurred infrequently; syncope, rarely. Mild paradoxical reactions (excitement, stimulation of affect) are reported in psychiatric patients. Minor diffuse rashes (morbilliform, urticarial and maculopapular) are rare. Nausea, lethargy, edema, slurred speech, tremor and altered libido are rare and generally controllable by dosage reduction. Although rare, leukopenia and hepatic dysfunction including jaundice have been reported during therapy. Periodic blood counts and liver function tests are advised. Ataxia, reported rarely, does not appear related to dose or age.

These side reactions, noted with related compounds, are not yet reported: paradoxical excitation with severe rage reactions, hallucinations, menstrual irregularities, change in EEG pattern, blood dyscrasias (including agranulocytosis), blurred vision, diplopia, incontinence, stupor, disorientation, fever, euphoria and dysmetria.

Availability: Capsules of 10, 15 and 30 mg. oxazepam.

To help you relieve anxiety and tension

PRESIDENTIAL EDITORIAL

Richard D. Bauer, MD
President, Medical and Chirurgical
Faculty of the State of Maryland
April 1967-April 1968

As I sit at my desk pondering these changing times in which I take over the presidency of the Faculty, two problems seem to be of equal primary importance. The first of these is not new—indeed, it has been a matter of concern for several years. I refer to the effect of the "welfare state" on our mode of life. The second has to do with the role of the general practitioner in this day of "super-specialization" and changing concepts of medical practice.

I hasten to mention that the opinions expressed here are my own and do not necessarily reflect Faculty policy.

History tells us that a nation based on a widespread welfare foundation is a nation in trouble, economically and morally. A welfare state is a bureaucracy that fosters laziness and nonproductivity. There is a striking contrast in our own national history illustrating this point so well that it seems incredible people can overlook it. Consider, on the one hand, the Emancipation Proclamation of the year 1862. In freeing the Negroes from slavery, the act allowed them to better themselves as best they could. They were given the right to certain basic freedoms, such as free-

dom to choose their type of work, to educate themselves as much as possible, and to provide for their own old age. Theirs has been a long hard struggle over the past hundred years, but we are witnessing the emergence of a powerful citizenry that numbers among its people leaders in almost every field.

Now consider the American Indian. This once proud and vital race represents the ultimate welfare state. They live on reservations and approximately 13,000 Federal workers look after them, roughly one worker for every 30 Indians. What is their plight? They have lost their pride and their initiative. They have become lazy, indigent and nonproductive.

This is why thinking men should harness the welfare philosophy before it is too late. This is why we must be extremely careful of who receives welfare benefits. True, we can and must take care of those who cannot take care of themselves—we always have. Something is radically wrong, however, with a system that allows welfare support of those who can take care of themselves but will not do so.

In regard to the second question, that of the role of the general practitioner, we must put aside all personal philosophy and prejudice and view the problem objectively. It is interesting to watch what is happening now. Banks, insurance companies, pharmaceutical houses and the medical fraternity are being flayed in the press and in Congress. Each of these groups has done a good job and, justifiably, has a good self-image. Unfortunately the image one has of oneself is not always the same as that seen by others. There are thousands of restless eyes that may see things a little differently.

We, as physicians are not looked upon by people the way we used to be. We have failed to realize that the circumstances of medical practice have changed. Our present clinicians are much better trained than they used to be, but there is something lacking. It is obvious from many meetings and from the Millis Report that extreme specialization and the slow disappearance of the family doctor is not satisfactory. There is talk now of educating a "primary physician." To my way of thinking, medicine has an obligation to keep intact the ratio of general practitioners to specialists. Specialization is very important, but so is general practice. People need more than science. The family doctor is a friend, an advisor and a "Dutch uncle." People do not always pay him, but they love him. An explanation of his secret is given by Balint:

> The most frequently used drug in general practice is the doctor himself and this is a drug without directions as to dosage, frequency of administration or undesirable side effects. We know that the doctor himself is an extremely powerful drug and that those who use it relieve more suffering than has yet been recorded by the most powerful drug in the pharmacopoeia. The family doctor knows this and he prescribes himself in generous doses.

Actually, this is the secret of the whole practice of medicine no matter what position one occupies—student, teacher, specialist, administrator or family doctor.

Francis J. Braceland, MD, recently spoke of the tremendous "information explosion" which we have seen in medicine for a number of years. We have been inundated with new information at such a rate that it is difficult to keep up with it all. This is what has led to the extreme in specialization. It will not cease; there will be even more innovation in the future. There will be many changes but this is as it should be because all of life is change. As Edna St. Vincent Millay wrote:

> All creatures to survive, adapt themselves to the changing conditions under which they live.
> If they can grow new faculties to meet the new necessity, they thrive; otherwise not.
> The inflexible organism, however much alive today, is tomorrow extinct.

We may expect change, and must be prepared for it. We must be adaptable to changing concepts of public welfare, but within the bounds of common sense, and we must also be adaptable to changing concepts of medical treatment, but within the framework of a constant, workable ratio of general practitioners to specialists. Changes may at times be vexatious, but they are necessary.

IATROGENIC INFECTIOUS DISEASE PROBLEMS, WITH PARTICULAR REFERENCE TO PYELONEPHRITIS

CHRISTOPHER M. MARTIN, MD
Professor of Medicine and Pharmacology, Georgetown University School of Medicine
Director, Georgetown University Medical Division District of Columbia General Hospital

As physicians, all of us have a basic responsibility both to treat and to prevent disease. At the same time, we also bear a very serious responsibility to obey the injunction of Hippocrates to do no harm.

These principles have particular bearing on the problem of pyelonephritis. In the light of information accumulated over the last ten years or so, and following upon the fundamental observations of Dr. Edward Kass at Harvard Medical School in the mid-1950's, we now know that pyelonephritis is the second most common infectious disease in the United States, exceeded in frequency only by acute and chronic respiratory tract infections. Moreover, we now know—much to our dismay—that the vast bulk of pyelonephritis in the United States today is caused by physicians.

This comes as quite a startling realization to many physicians who have been practicing medicine of high quality for many years; yet, the evidence is overwhelming.

Our interest in this field began in 1961, following a review of cases of bacteremia at the Jersey City Medical Center, in New Jersey; it was found that despite all the publicity and interest that had been given to staphylococcal and other gram-positive coccal bacteremias, by far the most common bacteremia—indeed, about half of all bloodstream infections with sepsis—were due, instead, to gram-negative rods.

Review of the charts of 102 patients with gram-negative rod bacteremia in 1960, 56% of whom died, revealed that in 81 of them, pyelonephritis was the source of bacteremia. Moreover, 78 of these 81 patients had had some form of urinary tract instrumentation either prior to the hospitalization in which the bacteremia occurred, or during that hospitalization. The most common form of associated instrumentation was indwelling urinary tract catheterization.

These observations were consistent with the published data of many investigators, particularly Dr. Paul Beeson, then professor and chairman of the department of medicine at Yale. You will recall that Dr. Beeson wrote a famous editorial in the American Journal of Medicine entitled, "The Case Against the Catheter,"[1] in which he marshalled all the evidence indicting catheters as major causes of infection. He came to the conclusion that the indwelling Foley catheter was a

Presented at a combined medical program of St. Joseph Hospital and the Baltimore County Medical Association, at St. Joseph Hospital, Baltimore, Feb 4, 1967.

dangerous if not lethal instrument, and that it should be abolished.

Although we sympathized with this view, we nevertheless recognized that catheters cannot be abolished; they are obviously of extraordinary importance, comparable to the hollow needle in medicine. They are an integral part of the weaponry of surgeons, internists, gynecologists, and obstetricians. We concluded that there must be a better catheterization method than the standard Foley catheter for patients who had problems with micturition and who required indwelling catheterization. As a result, we set up a controlled trial of old and new catheter technics in gynecologic patients at the Jersey City Medical Center.

The patients in the trail were 75 women consecutively undergoing gynecologic surgery, who would require post-operative indwelling urinary catheterization. The patients were randomly assigned to one of four catheter groups; assignment was on the basis of the two terminal digits of the patient's hospital number. In other words, the physician taking care of the patient had nothing to say about which catheter was going to be used.

The four kinds of catheter technics studied included:

1. The straight Foley catheter with standard good catheter technic.

2. A straight Foley catheter with systemic chemoprophylaxis in the form of chloramphenicol, 2 gm a day. (The large majority of urinary-tract pathogens were sensitive to chloramphenicol at that time [1961].)

3. The so-called "three-way catheter," with a constant bactericidal rinse of the catheterized bladder. (The "three-way catheter" is essentially a Foley catheter with an extra lumen, through which one runs into the bladder a constant slow drip rate of an antibacterial solution; in this instance, the solution was ¼% acetic acid.)

4. Another three-way catheter group, with a bactericidal rinse consisting of a solution of neomycin and polymyxin, in low concentration.

The results of the study are shown in the Table. These are the infection rates in women proved non-bacteriuric prior to catheterization. As shown by many other authors, the infection rate in women with Foley catheterization (Group 1) was 11/11; in the women who had Foley catheters with chloramphenicol chemoprophylaxis, the infection rate was 10/13 (77%)—not significantly different from Group 1. Those having a three-way catheter with an acetic acid bactericidal rinse had an infection rate of 1/6; none of the 10 women on a three-way catheter with the neomycin-polymyxin rinse acquired infection.

The infection rate in Group 4 is significantly different from that in Groups 1 or 2; the odds against this difference occurring by chance are over 1,000 to 1.

There was an interesting fifth group that emerged from the study. These were patients of private physicians who objected to their entering the trial, and instead placed them on Foley catheters with penicillin-streptomycin chemoprophylaxis. These patients' bacteriology was also followed, and 5/7 became infected. This infection rate is not significantly different from that in either the Foley or Foley-plus-chloramphenicol group.

As a result of this study and the concern about the rising incidence of gram-negative rod bacteremia at this hospital, the medical staff in late 1961 decided that the time had come to prohibit further use of the Foley catheter, and to recommend instead, as a routine catheter technic, the so-called

INCIDENCE OF BACTERIURIA AFTER INDWELLING CATHETERIZATION IN 47 NON-BACTERIURIC PATIENTS

	No. of Patients		
Catheter Group	Total	Acquired Bacteriuria	Infection Rate
1. Foley	11	11	100%
2. Foley + chloramphenicol	13	10	77%
3. 3-way + acetic acid rinse	6	1	17%
4. 3-way + neomycin and polymyxin rinse	10	0	0
Foley + penicillin and streptomycin	7	5	71%

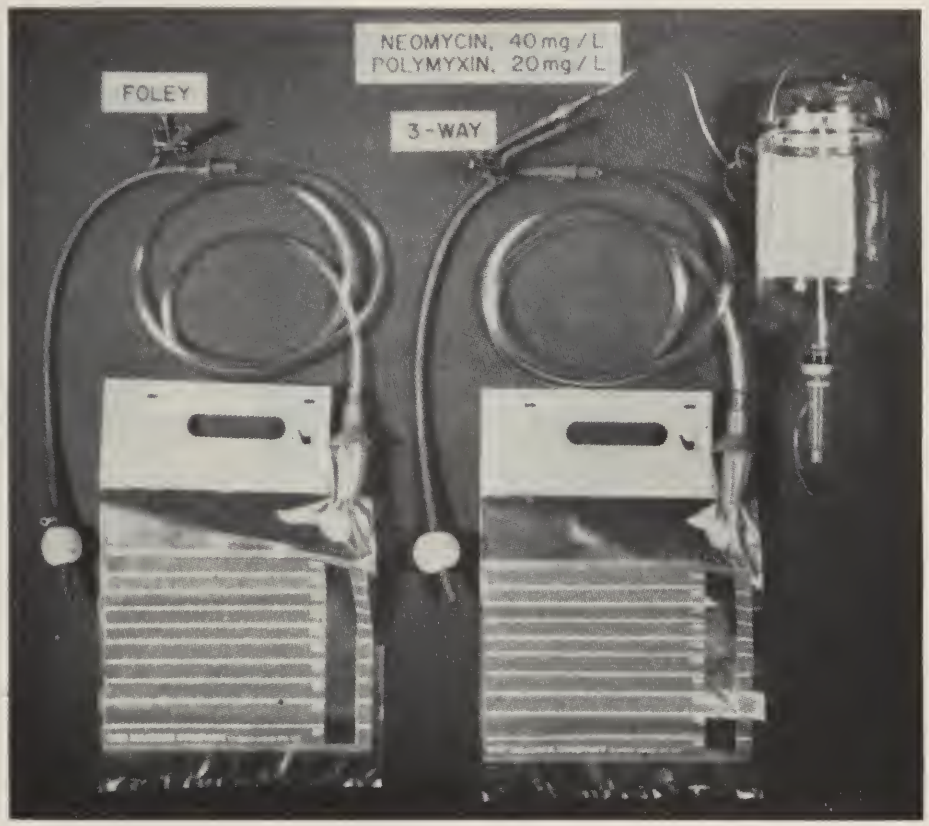

Fig 1
Foley catheter (left) and three-way catheter with neomycin-polymyxin rinse (right).

three-way catheter with constant rinse of the bladder with dilute neomycin and polymyxin.*

In the year that followed announcement of this policy, the Foley catheter was, of course, used to some degree. On the whole, however, the hospital staff switched over to the three-way catheter technic.

The three-way catheter and the conventional Foley catheter are shown in Figure 1. The concentrations of neomycin and polymyxin chosen were designed to produce non-toxic but reliably bactericidal levels of each antibiotic in the urine-rinse mixture in the bladder at all times.

Subsequent studies in larger populations demonstrate that the three-way catheter is by no means perfect. No catheter system is—there is always a calculated risk. But it is clearly much safer than a Foley catheter. The infection rates on conventional open Foley catheters, as observed by many authors, run to about 96% after four or five days; in contrast, the infection rate with the three-way catheter plus neomycin-polymyxin constant rinse is about 4% after five days, and about 6% after ten days. The longer catheterization is prolonged, the greater the risk of becoming infected, no matter what catheterization technic is used.[2]

In any event, after a year's experience in substitution of this newer catheter technic, we attempted to detect any influence of the change on the incidence of disease at the hospital. We therefore made a comparative study of the incidence of bacteremias at the Jersey City Medical Center in 1962, the first full year of three-way catheter experience, with that in 1960, the last full year of standard Foley catheter usage.

Figure 2 shows some basic information about the hospital in the two years. The numbers of admissions and the overall mortality rates were about the same in 1960 and 1962. The number of

* 40 mg neomycin and 20 mg polymyxin per 1000 ml isotonic saline per day.

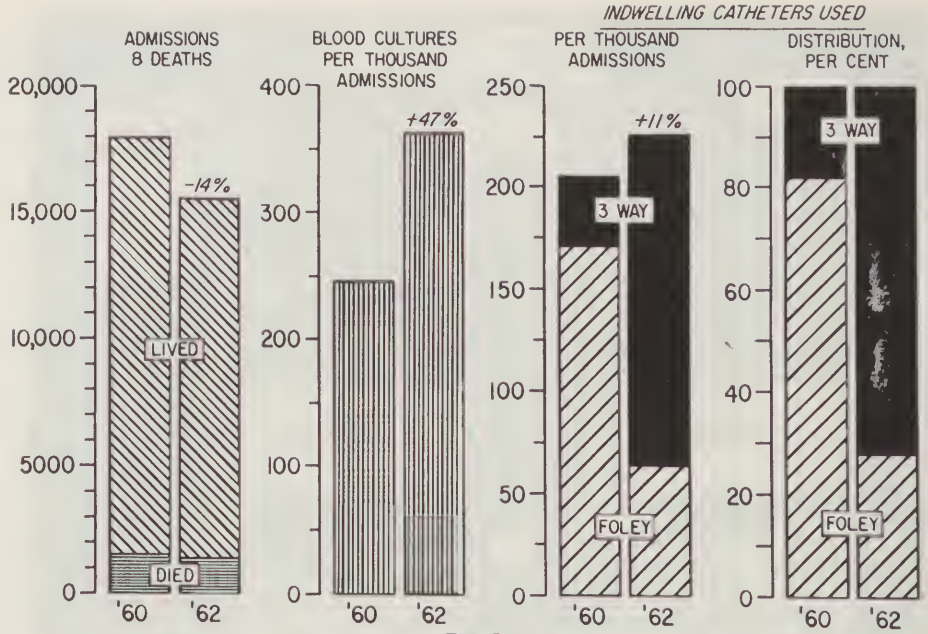

Fig 2
Admissions, blood cultures, and catheter usage at the Jersey City Medical Center in 1960 and 1962.

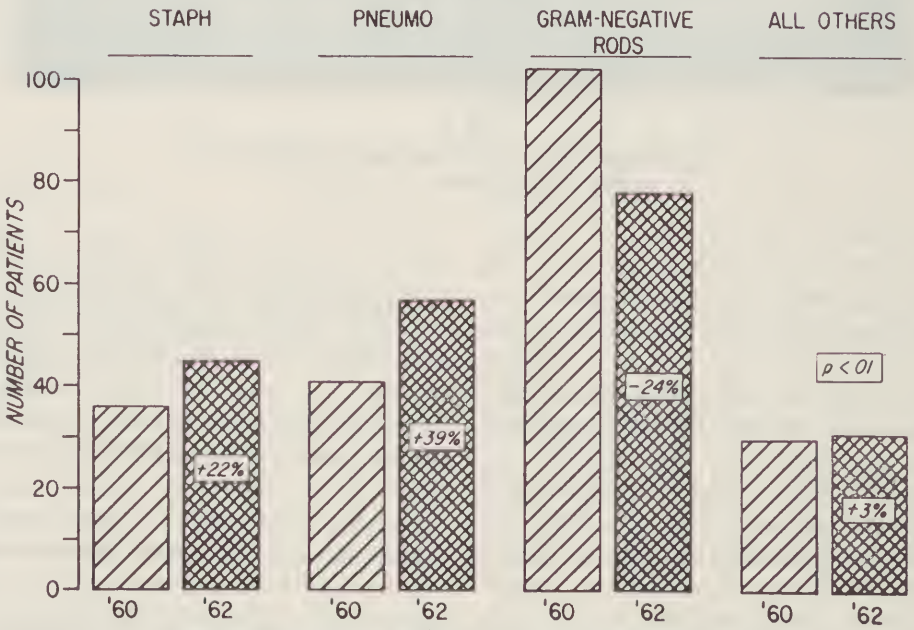

Fig 3
Bacteremias at the Jersey City Medical Center in 1960 and 1962.

blood cultures taken went up, however, in 1962, reflecting the fact that the Surgical Services were taking more blood cultures than previously.

Figure 2 also shows the changes in the types of catheters used. There were few three-way catheters used in 1960; in 1962, however, they constituted 72% of all the catheters used.

Figure 3 shows the numbers of bacteremias of various kinds in the two years. Consistent with the increased numbers of blood cultures taken, there was a 22% rise in staphylococcal bacteremias in 1962; a 39% rise in pneumococcal bacteremias;

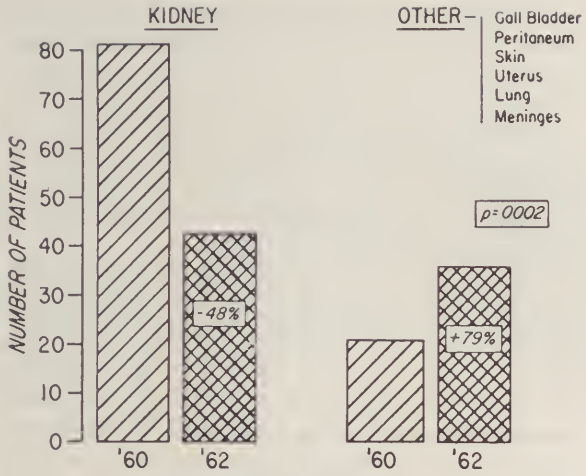

Fig 4

Sources of gram-negative rod bacteremias.

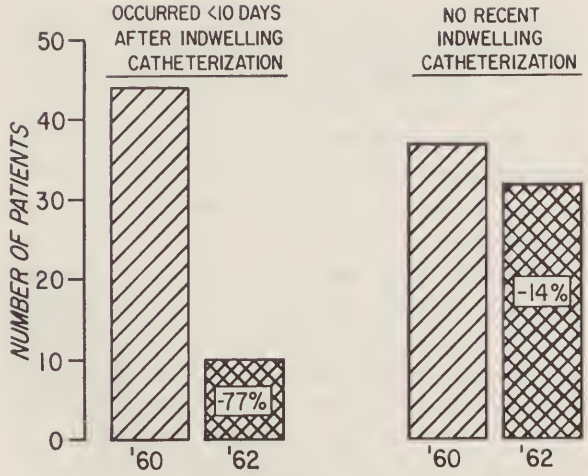

Fig 5

Gram-negative rod bacteremia of renal origin.

and a 3% rise in miscellaneous forms of bacteremia. Gram-negative rod bacteremias, however, declined by 24%.

This difference in distribution in types of bacteremias in 1962, as compared with 1960, could have occurred by chance less than once in a hundred times.

When we focus on gram-negative rod bacteremias specifically (Fig 4), we find that there was a rise of 79% in the incidence of gram-negative rod bacteremias arising from non-renal sources—ie, complicating cholangitis, peritonitis, infected decubitus ulcers, septic abortions and the like—and reflecting the fact that the surgeons were really on the alert in 1962 to bacteremias and were taking a good many more blood cultures. On the other hand, there was a 48% decline in numbers of gram-negative rod bacteremias complicating pyelonephritis. The odds that this change could have occurred by chance are about 5,000 to 1.

The influence of indwelling catheterization is shown in Figure 5. There was only a non-significant 14% drop in bacteremias complicating cases of pyelonephritis not associated with recent instrumentation. In contrast, there occurred a highly significant 77% decline in gram-negative

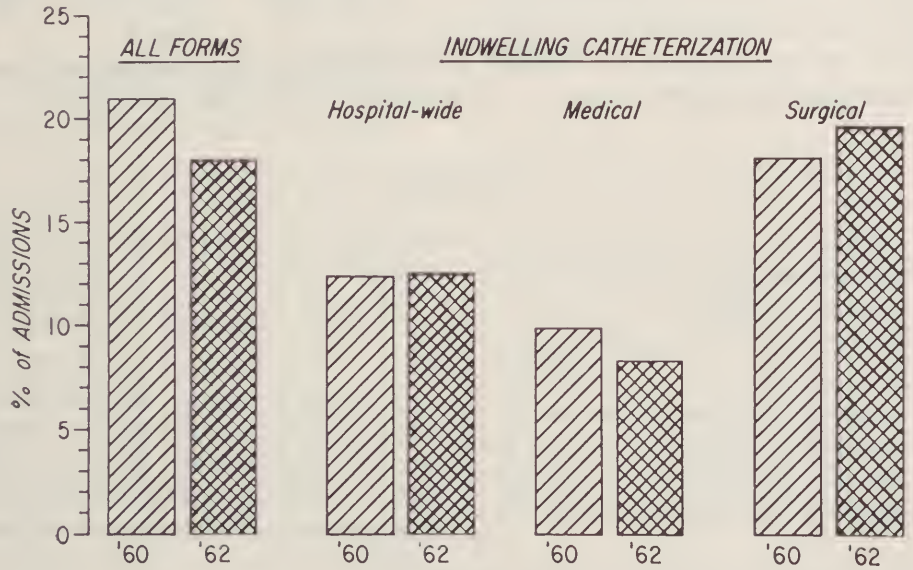

Fig 6

Urinary tract instrumentation at the Jersey City Medical Center in 1960 and 1962.

rod bacteremias occurring within 10 days of indwelling catheterization. The probability that this difference between 1960 and 1962 could have occurred by chance is about 1 in 1000. We therefore have clear evidence that the substitution of the new catheter technic was associated with a marked decline in numbers of gram-negative rod bacteremias.

Of course, there are other factors to be considered. For example, were there fewer bacteremias in 1962 because fewer patients were catheterized? The data in Figure 6 demonstrates that this is not the case—that indwelling catheter usage was virtually the same in the two years. Examination of this and other such relevant factors failed to reveal anything other than the newer catheterization technic that could have accounted for the decline in numbers of catheter-associated gram-negative rod bacteremias.

The number of deaths from all gram-negative rod bacteremias (Fig 7) fell from 57 in 1960 to 32 in 1962, a 44% decline. This difference is due primarily to the decline in numbers of deaths from bacteremias of renal origin—from 46 to 13. And this difference, in turn, is due primarily to the decline in numbers of deaths from catheter-associated bacteremias—from 33 to 5.

Now if we assume that this experience in Jersey City, NJ, is reasonably representative of what might be expected to happen elsewhere in the United States, we can make some estimates of the possible effects of abandonment of Foley catheters in all American hospitals and substitution of the 3-way catheter technique.

A simple rate calculation suggests that somewhere between 8,000 and 31,000 preventable deaths associated with conventional Foley catheterization occurred in the United States in 1962. It is obvious, therefore, that we have here a major area for effective preventive medicine on the part of internists, surgeons, gynecologists, urologists—indeed, all physicians.

In conclusion, we have here an example of the value of reexamining traditional concepts in medicine, and of asking ourselves whether our therapeutic methods do more harm than good. When we can identify this kind of harm and do something about it, then we will have fulfilled our highest responsibilities as physicians.

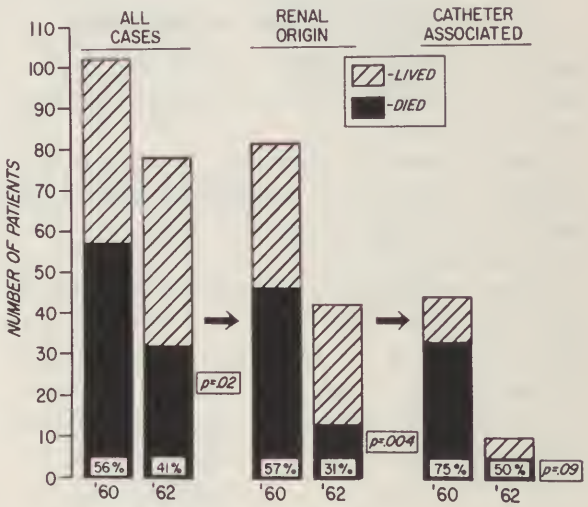

Fig 7
Mortality from gram-negative rod bacteremia in 1960 and 1962.

Discussion

QUESTION: *What kind of unit do you use for your three-way catheter rinse? Are the catheters available from various companies?*

DR. MARTIN: Although one can arrange for one's hospital pharmacy to make up the rinse solution from bulk neomycin and polymyxin, it is much more convenient to purchase the rinse formulation in one cc vials, which are now available from two companies—Burroughs-Wellcome and Upjohn.

Three-way catheters are available through the major catheter manufacturers, American Cystoscope Makers, Inc., and the Bard Company. These catheters cost a few cents more than standard Foleys.

QUESTION: *How fast is the irrigating fluid run in?*

DR. MARTIN: At a rate of about one liter per day, or about 40 cc per hour. The flow rate is not at all critical. It can be as low as 500 ml per day, or as high as 3,000. In general, one aims to match the patient's approximate endogenous urine output.

QUESTION: *How were these patients prepared for catheterization? And since the subjects in*

your controlled study were all women, would it be possible that we would be getting a lower incidence of infection in males?

DR. MARTIN: First, in all these catheterizations, the urethra and peri-urethral area were thoroughly cleansed and disinfected, and the catheterization performed with standard aseptic technique. As to the second question: On the basis of our hospital-wide experience in all patients, there would appear to be no significant difference in the effectiveness of the 3-way catheter system in men and in women.

QUESTION: *Were any studies done with different anti-bacterial agents; in other words, neomycin by itself, for instance? How did you show this?*

DR. MARTIN: That is an interesting question. We have looked at quite a few antibacterial substances as possible substitutes for neomycin-polymyxin. As Dr. Kass originally showed, dilute acetic acid possesses comparable activity. Unfortunately, dilute acetic acid is impractical, because the rinse flow must be maintained at just the right rate; too fast a flow gives rise to hemorrhagic cystitis, and too slow a flow (with consequent inadequate lowering of urine pH) produces ineffective antibacterial conditions. Other substances that we have tried include organic iodine, nitrofurazone, and things of this nature. These all cause a high incidence of hemorrhagic cystitis. It would appear that the neomycin-polymyxin rinse is quite bland and virtually non-toxic.

QUESTION: *This method you mentioned is for hospital patients. How about ambulatory patients who need indwelling catheters?*

DR. MARTIN: The method can be adapted to ambulatory patients, but with some difficulties. There is no single set of equipment one can purchase to do the job. One can, however, put it together by hanging from the waist a bag of the type used for collecting T-tube drainage, and using this for the inflow rinse fluid; an outflow collection bag can then be strapped to the patient's leg. One can also reduce the volume of rinse flow from a liter a day to 250 ml per day by simply using a solution four times as concentrated, but running it in at only one-fourth of the usual rate.

I would say that this technique is primarily designed for hospital patients; it is most useful in those patients who require relatively brief (1- to 10-day) catheterizations.

"THE SINISTER GARDEN"

Please don't eat the buttercups—or the iris, or the rhododendron. And don't munch on the mistletoe berries, either.

This is part of the information in a booklet distributed to poison control centers, hospital accident wards, pediatricians, general practitioners and pharmacists by field representatives of Wyeth Laboratories during National Poison Prevention Week, March 19-25. Entitled *The Sinister Garden,* the booklet contains drawings of 56 different plants found in flower and vegetable gardens, in fields or as ornamental plants in the home. The toxic parts of each plant are listed along with the symptoms that may occur when those parts are ingested.

The Sinister Garden points out that parts of *edible* plants may also have toxic effects. For example, the potato itself is edible, but the sprouts, leaves and stems of the potato plant "may cause mental confusion, cardiac depression and clammy skin." And rhubarb plants can be cooked for the dinner table, but rhubarb leaves may cause vomiting and severe abdominal pains.

Other plants, parts or all of which are poisonous, include cherry and oak trees, privet hedge, wisteria and mountain laurel.

From a Wyeth Laboratories news release, March 1967.

INFLUENCE OF SPLENECTOMY ON CHILDHOOD INFECTIONS

J. ALEX HALLER, JR., MD
Chief, Division of Pediatric Surgery
The Johns Hopkins Hospital

Since the report in 1952 of two infant deaths from septicemia following splenectomy,[1] there has been natural concern that removal of the spleen would decrease resistance to bacterial infections in young children. A number of retrospective studies have attempted to determine the effect of splenectomy on incidence of infection, but it has been practically impossible to compare patient groups because disease processes within the groups varied so widely.

We have recently reviewed the post-splenectomy courses of 51 young children who were treated at The Johns Hopkins Hospital between 1928 and 1964. In addition, we have been studying the effect of splenectomy in small animals on experimentally induced infections. The discussion which follows concerns the function of the spleen in the immunologic mechanism and is based upon data from the patient review and these experimental studies.

Clinical Review

Fifty-one children between the ages of four months and ten years were randomly selected from the splenectomy files of The Johns Hopkins Hospital. It is significant that only one child was under a year of age and only seven were under two years of age. Seventy-five percent of these children were examined by the author or were reported upon by family physicians, with a post-splenectomy follow-up greater than one year. The age distribution of these children is shown in Table 1.

Indications for splenectomy are listed in Table 2. Five disease categories were selected arbitrarily to reflect in descending order the degree of hematologic involvement present in each case. It will be noted that the largest single group of splenectomies was for congenital spherocytosis.

An attempt was made to assess the incidence of infections before and after splenectomy with a full realization that this was largely a subjective evaluation. The highest incidence of infection occurred in the last three groups (Table 2), in which there were significant hematologic abnormalities, but the incidence of infection *before* and *after* splenectomy did not differ significantly.

There were no intraoperative deaths, but five patients died in the follow-up period. Two of these patients died with infections, as noted in Table 3. One was a three-year-old with idiopathic thrombocytopenic purpura (ITP) who died of probable septicemia 23 days after going home from the hospital. The other was an eight-year-old who had empyema following an esophago-jejunostomy for esophageal varices performed three years after her splenectomy. Except for these cases (No. 1 and No. 2 in Table 3), infection could not be implicated in the five deaths. Two of the remaining 33 patients continue to have significant hematologic problems requiring

Based on a paper presented to the Maryland Pediatric Society, Nov. 8, 1966.

close medical supervision, but the others lead active, normal lives.

During follow-up studies on this group of post-splenectomy patients and in the course of our review of reported studies on post-splenectomy patients, it became obvious that neither objective nor comparative information was likely to be forthcoming from any human patient group because of serious difficulties in defining a satisfactory control group. We therefore turned to the laboratory where a splenectomy model was already under study in small animals.

Table 1

SPLENECTOMY IN 51 CHILDREN

(The Johns Hopkins Hospital, 1928-1964)

Age (Years)	Number of Children
<1	1
1-2	6
2-4	9
4-6	9
6-8	13
8-10	13
Total	51

Age Range: 4 mos-10 yrs
Average Age: 6.1 yrs

	Children	
Sex	No.	%
Male	32	63%
Female	19	37%
Total	51	100%

Experimental Neonatal Splenectomy

Splenectomy and sham splenectomy were carried out in newborn mice in which the spleen was removed in half the litter, and in the other half the spleen was exposed but not removed.[2] Each mouse was then homografted with skin from an unrelated species to test the immune responsiveness of the two groups of experimental mice. In other litters splenectomy and sham splenectomy were carried out in mice three, six and nine days of age.

All mice in the four groups rejected skin homografts at normal times and with the usual characteristics of strong immunologic reactions.

Table 2

INDICATION FOR SPLENECTOMY

	Children		Average Age
	No.	%	(Years)
Trauma	11	21%	7.7
Spherocytosis	18	35	5.4
ITP	8	16	6.3
Hypersplenism	6	12	4.8
Other	8	16	6.0
Total	51	100%	

Using the same experimental model, splenectomized and sham splenectomized mice were injected intraperitoneally with cultures of Escherichia coli. Gram-negative bacterial peritonitis developed in all mice. There was no statistical difference in survival rates in the two groups.

Review of Reported Experience with Post-Splenectomy Infections

In their important clinical observations in 1952, King and Shumacker[1] emphasized the facts that they were concerned about post-splenectomy infections *only* in the infant age group and that their experience was confined to five infants. Parts of their report have been widely used out of

Table 3

CAUSE OF DEATH AFTER SPLENECTOMY

1. 3 yrs (ITP)—Died 23 days after discharge. Acute onset of high fever and delirium. DOA—no autopsy (septicemia??)
2. 7 yrs (Pancytopenia)—Died 13 days after splenectomy. Hemorrhagic diathesis.
3. 8 yrs (Extrahepatic portal hypertension)—Died 3 yrs after splenectomy from empyema and massive G-I bleeding following esophagojejunostomy.
4. 10 yrs (Biliary cirrhosis)—Died 5 yrs following splenorenal shunt (intestinal obstruction??)
5. 5 yrs (Hypoplastic anemia)—Died 1 yr after splenectomy from subdural hemorrhage after blow to head.

context to suggest that splenectomy in any child for any reason carries a significant risk of serious infection. A limited review of our experience at Johns Hopkins and an analysis of reported cases of post-splenectomy infections do not support this thesis.

The five infants reported by King and Shumacker were in a series of 100 splenectomy patients. In none of the others was there an increased incidence of infection. In 1951 Gruber and associates[3] reported a premature infant with ITP and a bleeding diathesis who succumbed to septicemia after splenectomy at 14 hours of age. This baby was obviously in dire straits at birth and had an emergency procedure under less than optimal circumstances. In 1954 Evans and associates[4] reported one serious infection in a large series of patients with hypersplenism. It occurred in a two-month-old baby with spherocytosis; the child recovered. In the same year Simpkiss and Cathie reported a septicemia death in a 14-month-old ITP patient in a group of older ITP patients who had no infections.[5] Two infants in the series by Walter and Chaffin in 1955 had severe hematologic disorders and died of terminal infections.[6] In the 200 cases reported by Golstein and Gellis in 1956 from the Boston Children's Hospital, only four cases of increased infections were noted after splenectomy.[7] Two were under one year of age. Two had had significant infections prior to splenectomy.

In the carefully studied series of Smith and associates (1957 and 1962), there were 13 patients with an abnormally high incidence of infection after splenectomy.[8, 9] These occurred in more advanced age groups, averaging six years of age. No information is given regarding the total number of children who were splenectomized in this same time interval, however, and the rate of incidence is therefore not known. Significant was the large number of patients in the series with Cooley's anemia (5 of 13) and the fact that four of the five deaths with infection had that disease. Cooley's anemia is known to be associated with an increased risk of serious infections.

Laski and MacMillan, in 1959, compared risks of infection following splenectomy in one group of children with that following appendectomy in a similar group.[10] They concluded that the incidence of infection was the same. There was, however, one serious infection in a four-year-old ITP patient who died after splenectomy. In a post-splenectomy population of 110 children reviewed by Robinson and Sturgeon in 1960, 13 serious infections occurred.[11] However, only one case developed among the 63 children whom they considered "non-disposed by prior disease to increased infections." Six deaths occurred in the other 12 children who averaged 32 months in age and had serious hematologic diseases.

In 1963 Thurman reported two deaths from infection in 73 post-splenectomy children, but he noted the same incidence in a comparable group with hematologic disorders who did not undergo splenectomy. He also carried out studies of gamma globulin levels and response to standard antigens and found no differences in the two blood dyscrasia groups.[12] In 1960 Broberger and associates in Sweden reported 460 splenectomies in children.[13] Fifty-six were under one year of age and 22% of them had serious post-splenectomy infections. The remaining 404 were between one and ten years of age, with serious infection in 11%; the greatest incidence was in patients with thalassemia (Cooley's anemia). These authors also noted that the serum proteins and the immune responses of the splenectomized children were within normal ranges.

These accumulated data suggest that splenectomy under one year of age may increase the risk of serious infection. They also suggest that splenectomy probably increases the risk of infection in a child who has a serious hematologic disease, which in itself predisposes the patient to increased infection. These hematologic diseases are complex and varied but generally fall into the categories of aplastic anemia, Cooley's anemia, thalassemia, hypersplenism (especially when accompanied by a bleeding diathesis), and perhaps idiopathic thrombocytopenic purpura (ITP). There is no evidence that splenectomy for trauma or for congenital hemolytic icterus (spherocytosis) predisposes children to increased risk from infection unless the patient is a tiny infant. In the first few weeks of life there may be many other factors besides removal of the spleen which contribute to increased risk from infections.

Discussion

Controlled double blind clinical studies of splenectomy and infection are practically impos-

sible to obtain despite the notable attempts to do so in a tangential fashion by Laski and MacMillan[10] and by Thurman.[12] No one is willing to deny splenectomy to children who will benefit from the operation in order to compare them with a group who have their spleens removed.

For this reason the more easily controlled animal studies were initiated. Prior experimental work has shown that splenectomy in adult rats (Rowley, 1950[14]) and in chickens (Wolfe, 1950[15]) results in a transient, minimal decrease in antibody response to a standard antigen, but this decrease in antibody titer lasts no longer than a few days. None of the earlier studies attempted to elucidate the role of the spleen in the newborn animal when the total immune mechanism is quite immature. There are theoretical objections to using skin homograft rejection as a measure of immune reactivity because humoral antibodies have not been shown to play a major role in this reaction. Nevertheless it has been repeatedly shown that any means of suppressing the immune response of an animal will result in some prolongation of graft survival. The fact that skin homograft rejection occurred at the same time and with equal vigor in both the splenectomized mice and those with sham splenectomy strongly suggests that the immune reactivity was intact and the same.

The spleen appears to serve as an important component of the total reticuloendothelial system, but there is little to support a unique role for the spleen in overall resistance to infection. An exception to this impression has recently been reported by Ellis and Smith,[16] who have preliminary evidence that the newborn human spleen is the sole source of opsonin, the specific antibody necessary for destruction of pneumococci. It is of great pertinence that the overwhelming infections reported in infancy following splenectomy have been largely due to the pneumococcus. After about six to eight months of age, opsonins are formed by other components of the reticuloendothelial system, namely, the lymph nodes and bone marrow; but prior to that time they are only found in the spleen. Thus it is entirely possible, if this preliminary information is confirmed, that the spleen *does* have a unique function in the newborn in this regard. Fortunately, however, there are very few indications for splenectomy under six months of age.

On the basis of these observations and our own experience, we find ourselves in complete agreement with Thurman's conclusions, in 1963, that when removal of the spleen is indicated, fear of increased infection should not interfere with performance of a splenectomy.[12]

This view has recently been reiterated by Diamond and associates (1965).[17] We would also agree with the editorial comments of Blattner (1957)[18] and Finland (1961)[19] to the effect that infants less than one year of age must be placed under very careful observation after splenectomy and possibly should receive prophylactic antibiotics. Certainly evidence of early infection after splenectomy in infancy calls for immediate, aggressive and specific antibiotic therapy.

Addendum

Since the clinical data was tabulated, two other cases of possible increased susceptibility to infection after splenectomy have been uncovered by Dr. William Zinkham of the Division of Pediatric Hematology at The Johns Hopkins Hospital. One boy had splenectomy for ITP at eight years of age. One year later he had a fulminant pneumococcal septicemia, but recovered. He has been well since. The other boy had splenectomy for ITP in another hospital and was admitted for steroid therapy at Hopkins. As an outpatient, he developed septicemia from a wood splinter wound and died in shock. These two patients should be added to the group with ITP.

MOTORCYCLE SAFETY LEGISLATION WORKSHOPS

As more motorcycles crowd the nation's streets and highways, the number of related injuries and deaths increases proportionately. In 1965 there were 1,580 motorcycle rider deaths in the US, a 41.3% increase over 1964.

According to the US Public Health Service figures, the death rate for motorcycle accidents in the US, in proportion to the number of vehicles, is twice as high as the comparable rate for automobiles and other motor vehicles.

The number of motorcycles on the roads has increased so rapidly—registration increased by 71% between 1960 and 1964 and by another 31% between 1964 and 1965—that legislation governing the safe operation of these vehicles has lagged behind in almost every state.

With this problem in mind, state licensing authorities, police chiefs, representatives of the motorcycle industry and physicians from eight midwestern states met in Indianapolis last December to participate in a motorcycle safety legislation workshop. The AMA Committee on the Medical Aspects of Auto Safety, which is now making an extensive study of the motorcycle problem in the US, was also represented at the meeting.

Workshop recommendations, made in an attempt to get some rough uniformity in the state laws on motorcycles in view of the increased amount of interstate travel today, included the following:

Motorcycle drivers should be licensed for driving motorcycles—an automobile driver's license should not be the sole qualification for driving a motorcycle.

All motorcyclists should wear helmets which meet the standards recommended by the U.S.A. Standards Institute. The helmet is considered one of the most important safety devices, since most victims in motorcycle accidents sustain head injuries.

Only one passenger, in addition to the driver, should be allowed to ride on a motorcycle, and then only if the motorcycle is properly equipped to carry a passenger.

There should be no more than two motorcycles operating side by side in a single traffic lane.

Rules governing automobile passing should apply to motorcycles.

Motorcyclists should drive with lights on at all times. (This was one of the more controversial topics considered at the workshop.)

A motorcyclist is entitled to the full use of a traffic lane. Auto drivers should respect this right, and not force any motorcyclist off the road.

No motorcyclist under the age of 18 should be given a license unless he has successfully passed an accredited automobile driver's education course, obtained a regular auto driver's license and taken a motorcycle driving test. In no case should a license be issued to anyone under 16 years of age.

From an AMA news release, March 1967.

COMPREHENSIVE COMMUNITY MENTAL HEALTH CENTERS IN MARYLAND

RIVA NOVEY, MD
Instructor and Psychiatrist
The Johns Hopkins University School of Medicine and Hospital

LINDBERGH S. SATA, MD
Assistant Professor, Department of Psychiatry
Director, Division of Community Psychiatry,
The Psychiatric Institute
University of Maryland School of Medicine

Both national and local interest in the establishment of comprehensive community mental health centers have increased markedly during the past several years. The impetus for this movement was initiated in part by President Kennedy in a September 1962 address to Congress and the American people, in which he stressed the long-unmet needs f vast numbers of mentally ill and retarded individuals in the United States.[1] The President pleaded for a "bold new approach," which was translated into law with the provision, in 1963, of federal assistance in the construction of comprehensive community mental health centers (Public Law 88-164) and, in 1965, of staffing grants to implement initiation of mental health services.

In the same year, after a period of careful study, the State Board of Health and Mental Hygiene published the *Maryland State Comprehensive Plan for Community Mental Health Services.* Most of the features of the plan were included among the provisions of the Community Health Services Act, passed by the Maryland State Legislature in 1966. It is the purpose of this article to discuss the meaning of community psychiatry in relation to community mental health, to outline the plan for Maryland as enacted by the Legislature, and to describe its features in the solution of mental health problems throughout the State. In order to present as clear a picture as possible, we shall begin with some basic definitions.

Since "community psychiatry" is still in a formative state, many physicians, including even experienced psychiatrists, sometimes find themselves at a loss as to its meaning. It is considered by some to be a branch of psychiatry that deals with the application of *public health techniques* to the problem of mental illness, but others prefer to define it as the application of *psychiatry* to the mental health problems of the community. Either point of view is compatible with the concept of a "community mental health center," which is properly defined as a *program* that provides comprehensive mental health services to meet the total needs of a community. A community mental health center is "more than a synonym for an outpatient clinic or a new name to describe the regionalized unit of a state hospital or a psychiatric unit of a general hospital. It is not necessarily a complex of resources housed in a fine new building."[2]

Such a center embodies several critical concepts requiring delineation. It must be an integral part of the community, with support and participation of its citizens, or it risks the dangers of isolation and of perpetuation of the stigmas of mental illness. The center should provide the comprehensive psychosocial services required in the treatment of patients. Furthermore, the center must ensure continuity of care to prevent fragmentation and inadequate patterns of service.

According to the regulations issued in con-

nection with the Mental Retardation Facilities and Community Mental Health Centers Construction Act of 1963 (PL 88-164, referred to above), a community mental health center must provide at least five essential elements of comprehensive mental health services:

1. Inpatient services.
2. Outpatient services.
3. Partial hospitalization services, including at least day care.
4. Emergency services provided 24 hours per day, within at least one of the three services above, and
5. Consultation and education services available to community agencies and professional personnel.

"Adequate services" have been defined as consisting of these five essential elements plus five other components:

1. Diagnostic services.
2. Rehabilitative services, including vocational and educational programs.
3. Pre-care and after-care services in the community, including home visits by professional personnel, foster home placement and half-way houses.
4. Training.
5. Research and evaluation.

History of Community Psychiatry

It would be easy to get the impression that community psychiatry was invented by the psychiatric profession in the 1960s. This is far from true. The ancient philosophers advocated many features of our present programs. Galen favored the treatment of relatives of patients, Hippocrates and Aesculepius recommended the "open door." The Belgian Gheel family care system for psychiatric patients was begun in the 12th century. Many other enlightened methods of modern care were features of European and American hospitals in the 19th century.

The modern community psychiatry movement, which has developed so rapidly within the past decade, was preceded by half a century of greatly increased awareness of the relationship between mental illness and the social environment. Some psychiatrists call attention to the role of Sigmund Freud in introducing the concept of the important relationship between illness and early experience in the family. There is general agreement that Adolf Meyer, who stressed the importance of studying circumscribed units of population, was an important forerunner of community psychiatrists. He was interested in the dynamic and social factors leading to mental illness.

The early years of the 20th century also saw the beginning of psychiatric social work, a profession initially introduced by psychiatrists in an effort to maintain the liaison between patients and community. Arousal of public interest by Clifford Beers, who wrote *The Mind that Found Itself*, and the subsequent development of the Associations for Mental Health, deserve mention as significant influences on this nation. The late 1920s and 1930s saw the development of child guidance clinics that employed teams of psychiatrists, psychiatric social workers, and psychologists working together with children and their parents in the interest of prevention and treatment of emotional disturbances of childhood.

In the 1940s and 1950s community psychiatry received a tremendous impetus with the advent of World War II and with certain other developments, listed here in chronological order:

1. The Marlborough Program, begun in 1938, was developed during World War II in an English hospital under the direction of Joshua Bierer. Its key points were a day care center, a night care center and an after-care rehabilitation center.

2. The Therapeutic Community, a system developed in England during World War II by Dr. Maxwell Jones, introduced the modern *open door policy*. With the doors to the hospital unlocked whenever possible, patients were again treated humanistically and with respect. They were encouraged to participate in creating a therapeutic environment under the supervision and counsel of the hospital staff. These were either new or rediscovered-old features of hospital treatment which soon spread widely in the United States.

3. The Amsterdam Program, developed by Querido after World War II, was an emergency service involving a home visit by the psychiatrist in an attempt to manage the patient with

medication and support until a bed was available in a hospital. It soon became clear that the technique often eliminated the necessity for hospitalization altogether.

4. The National Mental Health Act, passed by Congress in 1946, was partly the result of concern over the fact that one out of every eight young men examined for the armed forces had been rejected on grounds of emotional instability. The Act provided grants to the states for developing mental health programs outside of state hospitals. It also provided for the establishment of the National Institute of Mental Health (1949) as headquarters for the new federal program.

5. The 1953 report of the World Health Organization's Committee on Mental Health emphasized the need for community treatment of the mentally ill. Stating that the need to provide more beds in mental hospitals was overemphasized to a point of neglect in the development of services that would reduce the need for admission, the Committee recommended that community mental hospitals provide outpatient and part-time treatment, rehabilitation services, research, and community education programs.

6. New tranquilizing drugs, introduced in 1955, gave tremendous momentum to the community psychiatry movement, for many patients previously not amenable to either psychotherapy or milieu therapy became responsive to treatment, and could be discharged from hospitals and treated within the community.

7. The Mental Health Study Act, passed by Congress in the same year, resulted in the creation of the Joint Commission on Mental Illness and Health under the chairmanship of Dr. Jack Ewalt.

Action for Mental Health, the report of the Joint Commission, was published in 1960.[3] It stressed the need for changing the locality of treatment of mentally ill patients from the large outlying state hospitals to the communities in which they lived. This eventually led to President Kennedy's historic address and to the passage of Public Law 88-164 in 1963. As already mentioned, the purpose of this law was to make possible the construction of comprehensive community mental health centers in order to keep patients in touch with their families and thus avoid a prolonged break with their normal social environment. At the present time many states are engaged in developing such centers. Some very good ones are already in existence—examples are the Massachusetts Mental Health Center and the San Mateo County Mental Health Services in California, each with its characteristic programs patterned to meet differing local needs. Examination of existing models of community mental health centers demonstrates the uniqueness of each individual community and the desirability of modifying programs to accommodate differences.

The Methods of Community Psychiatry

Community psychiatry covers a number of methods of treatment and prevention, some of which are very old, some of which have come along in fairly modern times, and some of which are extremely new.[4,5] These will be outlined here. Generally speaking, topics 1, 2 and 3 below correspond, in inverse order, to the tertiary, secondary, and primary remedial and/or preventive techniques of public mental health. Tertiary techniques are aimed at reducing the incidence of residual defect, secondary techniques at reducing the prevalence of mental disorder through diagnosis and effective treatment, and primary techniques at preventing the occurrence of mental disorder by counteracting harmful influences leading to it.

1. Care of the Severely Ill

   A. In the hospital

      a. Open wards wherever possible

      b. Participation of patients and staff in group activity and patient government

      c. Control of disturbed behavior by psychotherapy; chemotherapy; social, occupational and work therapy; and rehabilitation programs

      d. Efforts to increase the contact between the patient in the hospital and the outside community—visiting is encouraged; home visits are frequent; volunteers are invited into the hospital

      e. The "unit system" by which large hospitals are divided into small subdivisions, each responsible for a geographic region of

the community.

B. In transitional facilities

a. The day hospital

b. The night hospital

c. Half-way houses where patients may live after leaving hospitals but before returning home

d. Ex-patient clubs

e. Family treatment

f. After-care services by family physicians, visiting nurses, psychiatric social workers, or other mental health workers

g. "Satellite" after-care clinics in the centers of population for remote hospitals.

2. Specific Preventive Measures

A. Home treatment services

B. Admission screening services provided by psychiatric hospitals

C. Preadmission services, frequently involving home visits (these frequently avert hospitalization)

D. Walk-in emergency treatment in the general hospital

E. Suicide prevention services

F. Psychiatric services in general hospitals

G. Outpatient treatment of adults and children

H. Counselling of college students

I. Consultation services to social agencies, courts, visiting nurses

J. Crisis intervention (assistance at special times as in entrance to college, after birth of premature babies, after death of close relatives).

3. General Preventive Measures

A. The achievement of increased freedom from poverty, improved living conditions and better education

B. Community education regarding certain principles of mental health

C. Communication between psychiatrists and allied groups—physicians, ministers, etc.

Mental Retardation and Community Psychiatry

It seems appropriate that the mentally retarded be included among the people served by community psychiatry. A number of studies have confirmed that a high percentage of children who are retarded in school are not essentially deficient in intellectual capacity, but are emotionally disturbed, culturally deprived, neglected, deserted, orphaned, brain damaged and sensorially handicapped in various combinations.[6] It has been estimated that about five million people in the United States are mentally retarded. These fall into three major categories: (1) The profoundly retarded or totally dependent, with IQs between 0 and 19, constitute about 0.1% of the total population and 3.5% of retardates or 180,000 persons; (2) the moderately or trainable retarded, with IQs of 20 through 49, represent 0.3% of the total population and 11% of retardates or 450,000 persons; and (3) the mildly or educable retarded, with IQs of 50 through 69 or 79, number about 4¼ million and constitute about 85% of the 5 million retarded persons.

The following is a list of suggested components of comprehensive services to the retarded:

1. Consultation services for obstetricians and pediatricians, who first discover the handicapped children, and who may be able to help the parents to keep the child at home when this is advisable.

2. Diagnostic, evaluative and counselling services for parents of retarded children.

3. Home visiting services to help a mother to keep moderately to severely retarded children at home during the early years of life—such mothers need special help with feeding, handling, toilet training, and disciplining of young children.

4. Nursery school-clinic programs to provide growth and training opportunities for children as well as an opportunity for adults to study the children in a natural environment.

5. Day care services for severely retarded persons who are excluded from special classes for the trainable or who are beyond the age limit for these classes—such centers would teach

self-help and would provide habit training and socialization.

6. Special education which would make it possible for retarded children to participate in as many regular classes as possible—the many mildly retarded children who are educable can "for the most part be made employable and will, after the spotlight of school programs is removed from them, blend anonymously into the general community."

7. Vocational training.

8. Recreational facilities for the more severely handicapped.

9. Institutional resources other than the usual permanent institutional care—educational institutions, half-way houses, and places for short-term emergency care during family illnesses or vacations.

Such programs as noted would help to compensate for inadequately staffed and overcrowded residential facilities.

The Situation in Maryland

For a long time it has been recognized in Maryland that emotional and behavioral disorders (including alcoholism) are among the important health problems of the State and that, for many patients, exclusive long-term treatment in large institutions deters rehabilitation. Despite a number of scattered efforts in various localities to improve mental health resources, diagnostic and treatment services at the local level have been inadequate or unavailable. The *Maryland State Comprehensive Plan for Community Mental Health Services* provides for the correction of such deficiencies. Based on a two-year study of State-wide needs and facilities—a study under the direction of Dr. Alice B. Tobler that involved many public health and mental health professionals, educators and knowledgeable citizens, this plan involves a shift from State-oriented care in large institutions to community- or local government-oriented facilities near a patient's home. It stresses the importance of services and organizational changes to keep patients in closer touch with their families and to avoid a complete or prolonged break with their families, jobs and community. It is wide in its scope, involving not only diagnosis and treatment of existing disorders, but far-reaching primary and secondary preventive measures, such as day nursery care, foster group care, vocational education, psychiatric court consultation, school psychiatric services, and services for the aged. It ranges from single component units of a coordinative program to be added to existing facilities

to completely new comprehensive mental health centers to be constructed in a few areas.

It provides for the support of this program by matching arrangements between the State and local communities. It also provides for the establishment of regional mental health directors who will work closely with county commissioners and the Baltimore city government, as well as with county and city health officers, the regional mental hospitals, and local advisory boards consisting of knowledgeable citizens and representatives of significant agencies. The idea is to preserve the function and authority of local health officers and to sustain the standards of the State Department of Mental Hygiene.

Since the comprehensive plan for mental health services is community based, it is geared to the geographical, historical and socio-cultural differences of the various areas of the State. To one familiar with Maryland and its regional characteristics and problems it is not surprising that the State has been divided into five major areas for planning purposes. As shown in the Figure, these areas have been designated as follows:

I. Metropolitan Baltimore
II. Maryland-National Capital area
III. Northwestern Maryland
IV. Eastern Shore
V. Southern Maryland.

To illustrate the differences discussed above, we shall briefly examine these areas. The inner city of the Baltimore Metropolitan area, with its high rates of mental and physical illness and every form of social and family disorganization, ranks first in the need for a community mental health center. Initial planning is under way for the first community mental health center, which will be located adjacent to the Baltimore professional campus of the University of Maryland. This center is a collaborative function of the State Department of Mental Hygiene and the Psychiatric Institute, University of Maryland School of Medicine, and will be operational by 1970. In anticipation of the development of Baltimore's first community mental health center, a pilot community mental health service program has been started in a limited area within the inner city.

Additional community mental health centers will be required in Baltimore City and are being planned in cooperation with The Johns Hopkins Hospital, Sinai Hospital of Baltimore, Inc., and the Baltimore City Hospitals. Three centers are planned for the densely populated sections of Baltimore County adjacent to Baltimore City. In Anne Arundel County, the Health Department and Crownsville State Hospital have already developed programs that chiefly serve children and adolescents and, therefore, further services for adults will be stressed. The program for Carroll County, which may also include Harford and Howard Counties, will center around Springfield State Hospital. The Maryland-National Capital Area (Prince George and Montgomery Counties) with its relatively affluent and educated population, has as high an incidence of social disorganization and mental illness as in Baltimore, but for different reasons than exist in Baltimore City. Here the presence of many families uprooted from their communities and functioning in tense competitive situations is believed to account for the great need for expanded mental health services, especially those for the adolescent age groups. A residential school for children with emotional problems is badly needed.

The western Maryland Counties (Allegany, Frederick, Garrett and Washington) need various social services for optimal development of mental health programs. Vocational and mechanical training courses for children and adults are predominant local needs. A comprehensive community mental health program will be started in each of these counties utilizing facilities already present (there are especially well developed ones in Frederick County), but no construction is planned for Garrett County because of its limited population and its geographic characteristics. It may be adequately served by programs in Cumberland. A regional health and mental health center is planned for Cumberland as part of the Appalachian Program.

The Eastern Shore area, consisting of nine small and sparsely populated counties, has a large proportion of families with incomes of less than $3,000 a year, and a high rate of children and elderly persons on welfare, all of which must be considered in planning. The hub of the mental health program there will be the Eastern Shore State Hospital. Two satellite centers are planned, one on the upper shore and one on the lower shore. The Southern Maryland area (Calvert,

Charles and St. Mary's Counties) is in need of a small State hospital, and there have been special requests for family counselling and vocational training.

This account merely touches on the high spots of the overall picture for Maryland; we may not have mentioned needs that the reader feels are great in his particular county. There has been no attempt to detail the various programs and clinic services already in operation as collaborative ventures of the State Department of Mental Hygiene, the State Department of Health and such major training institutions as The Johns Hopkins Hospital with its Community Psychiatry Training Program. It is recommended that the reader who is interested in further details study the *Maryland State Comprehensive Plan for Community Mental Health Services,* a copy of which may be obtained through the State Department of Mental Hygiene.

The Manpower Problem

In concluding, it would seem important to call attention to the greatest problem involved in establishing community mental health centers—the shortage of well trained and experienced psychiatric personnel. This shortage has been felt for several years in Maryland by almost all of the existing facilities. The new facilities will create an even wider deficit unless provisions are specifically included for the development of manpower resources. Since 1955 there has been a decrease in the number of institutionalized patients, but the trend of increased admission rates with shorter hospitalization periods makes tremendous demands upon institutional psychiatrists as well as those functioning in the community. These demands are reflected in the following statistics: In 1955 there were 558,000 patients institutionalized; by 1965 this had been reduced to 490,000. During the same period, the ambulatory outpatient treatment of psychiatric patients had risen better than two-fold from 379,000 to 862,000 patients. Further, there are only a small number of graduates per year who join the psychiatric manpower pool. A survey of the dimensions of the problem indicates that about 1,000 psychiatric residencies went unfilled in 1964-1965. Only 4,000 psychiatrists were in training during that period.

Another aspect of the manpower problem is related to apportionment, for a large number of psychiatrists remain in private practice, and many remain close to metropolitan areas where there are medical schools and major hospitals. Of the 15,000 psychiatrists in the United States, 80% are currently in private practice. This shortage means that those psychiatrists who are interested in community psychiatry must learn to serve as consultants to community organizations. They must receive training in the administration of mental health agencies, and they must learn to work in close collaboration with psychologists, social workers, public health nurses, and other professionals who have considerable competence in the mental health field, each within his own discipline. Above all, the psychiatrists and physicians of other specialties must learn to collaborate in the identification, prevention, diagnosis and treatment of mental illness. Manpower needs, then, include cooperative utilization of exisiting personnel, particularly family physicians and privately practicing psychiatrists, in novel and diverse ways. Vital to the successful operation of community mental health centers in Maryland are training opportunities for the variety of disciplinary groups active in the mental health field.

In the coming decade the State of Maryland has the opportunity to develop new patterns of service which are comprehensive and which ensure continuity of care. The involvement and active participation of the medical profession will broaden the base for community-centered mental health care and will lead to earlier case finding and treatment. Lastly, the medical profession will occupy a critical role in the primary prevention of mental illnesses because of its central position in providing early health care to the family.

MEDICARE IN MARYLAND HOSPITALS

July 1966 and January 1967

GILBERT A. SANFORD

Associate for Research and Planning
Hospital Council of Maryland, Inc.

Prior to the advent of Medicare on July 1, 1966, there were many voices throughout the nation warning of the flood of Medicare patients that would inundate the hospitals as soon as the Medicare program started. Because of this concern, the Hospital Council of Maryland initiated a data-reporting system to determine the effect of the Medicare program during the one-month period of July 1966. The information included only the daily census in medical and surgical departments for patients under 65 years of age and those 65 years and over. Twenty-three hospitals in Maryland, representing more than half of all the medical-surgical beds, were included. The results of the study showed that the fear of a tremendous rush to hospitals was not realized.

Although there has been no great influx by the aged since the advent of Medicare, there is some indication nationally of a gradual increase in the use of hospitals by the aged. To test this supposition, the Hospital Council decided to re-survey Maryland hospitals. January 1967, six months after the original survey, was selected as the period appropriate for a follow-up study. The information gathered from hospitals was the same as before: each was asked to report, for each day of the month, the number of patients under 65 and the number of patients 65 years of age and over in the medical and surgical departments.

Table 1 presents an analysis of the responding hospitals broken down by geographic regions within the State. The regions include the following counties:

Baltimore: Anne Arundel, Baltimore, Carroll, Harford, Howard, and Baltimore City.

Western Maryland: Allegany, Frederick, Garrett, and Washington.

Southern Maryland: Calvert, Charles, and St. Mary's.

Montgomery-Pr. George's: Montgomery and Prince George's.

Eastern Shore: Caroline, Cecil, Dorchester, Kent, Queen Anne's, Somerset, Talbot, Wicomico, and Worcester.

Of the 46 general nonprofit hospitals in Maryland, 32 participated in the January survey. The number of beds in these 32 hospitals comprise 70% of all medical-surgical beds in the State. On a Statewide basis, this would appear to be an adequate sample. The only region which was underrepresented was the Montgomery-Prince George's region, with only 27% of the total medical-surgical beds accounted for.

This report appeared in *PLANNING, Research Bulletin No. 8* (March 1967), a publication of the Hospital Council of Maryland, Inc.

Table 1
ANALYSIS OF RESPONDING HOSPITALS BY REGIONS

	Number of Hospitals		Medical-Surgical Beds		Percent Medical-Surgical Beds in
	Total	Responding	Total	Responding	Responding Hospitals
State Total	46	32	7775	5462	70.3%
Balto. Metro. Area	20	14	4858	3552	73.1%
Region					
Baltimore (including Metro. Area)	23	16	5182	3750	72.4%
Western Maryland	6	5	788	723	91.8%
Montgomery-Prince George's	8	3	976	260	26.6%
Southern Maryland	3	2	220	120	54.5%
Eastern Shore	6	6	609	609	100.0%

Table 2
ANALYSIS OF MEDICAL-SURGICAL PATIENT-DAYS BY AGE OF PATIENT IN RESPONDING HOSPITALS, BY REGION, JANUARY 1967

	Total M-S Patient-days	Under 65	65 or Over	Percent 65 or Over
State Total	173,165	115,431	57,734	33.3%
Balto. Metro. Area	109,181	75,376	33,805	31.0%
Region				
Baltimore (including Metro. Area)	115,818	79,570	36,248	31.3%
Western Maryland	24,350	14,328	10,022	41.2%
Montgomery-Prince George's	9,240	6,316	2,924	31.6%
Southern Maryland	3,687	2,257	1,430	38.8%
Eastern Shore	20,070	12,960	7,110	35.4%

Table 2 summarizes the results of the survey, presenting the data by regions. In January, 33.3% of the medical-surgical patient-days involved patients of Medicare age. This is an increase of only one percentage point over the 32.3% in July, 1966. We therefore conclude that the population of Medicare age in Maryland has not significantly increased in Maryland hospitals. This supports the belief of many persons that medical care has been available to all persons needing it in Maryland regardless of their financial condition and that the Medicare program has merely changed, for some patients, the source of payment to the hospitals.

Table 3 shows the percentage of medical-surgical patient-days in each hospital involving patients of Medicare age. The data include the surveys made in July and in January. Where a hospital reported only in one of these periods, a dash has been placed in the appropriate column. More hospitals showed an increase in Medicare patients than showed a decrease. This was also true of the regions.

It is evident from these findings that, in Maryland hospitals, the dire forebodings of tremendous hospital increases among the aged have not materialized. This conclusion seems consistent with national data for July 1966 and November 1966 (the latest month available) as reported by *Hospitals, Journal of the American Hospital Association*. In July 1966 28.2% of patient-days were in the 65 and over category. This had increased to 30.2% in November, 1966. The conclusion also bears out the prediction of the Hospital Council in an earlier report (October 1965) that no more than 516 beds would be needed in Maryland by 1970 to care for the increase in patients resulting from the Medicare program.

Phenaphen® with Codeine

the only leading compound analgesic that calms instead of caffeinates

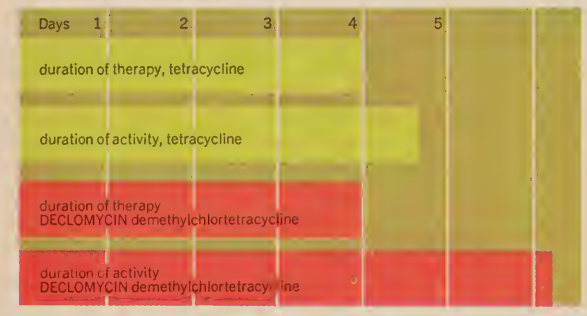
ach capsule contains:
henobarbital (¼ gr.) ..... 16.2 mg.
(Warning: may be habit forming)
spirin (2½ gr.) .....162.0 mg.
henacetin (3 gr.) .....194.0 mg.
yoscyamine sulfate .....0.031 mg.
odeine phosphate.....¼ gr. (No. 2),
½ gr. (No. 3), 1 gr. (No. 4)
(Warning: may be habit forming)

Contraindications: Hypersensitivity to any ingredient.

Precautions: As with all phenacetin-containing products, avoid excessive or prolonged use.

Side Effects: Side effects are uncommon—nausea, constipation, and drowsiness have been reported.

A-H-ROBINS



A. H. ROBINS CO., INC., Richmond, Va. 23220

why wonder about a drug

when you know

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

produces 1-2 "extra" days' activity

1-2 "extra" days' activity
after the last dose to protect against relapse

one 300 mg tablet b.i.d.
or
one 150 mg capsule q.i.d.

Effective in a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.

Contraindication—History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort.

Precautions and Side Effects—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York

After anorectal surgery...

METAMUCIL®

brand of psyllium hydrophilic mucilloid

- **Reduces painful strain...**

  The soft, easily propelled bulk created by Metamucil allows comfortable elimination with a minimum of effort and irritation.

- **Softens stools...**

  Metamucil absorbs water and creates a soft, pliant fecal mass which is demulcent to mucosal surfaces.

- **Relieves irritation...**

  Metamucil provides "smoothage" to prevent the formation of scybalous concretions and to lessen painful tenesmus.

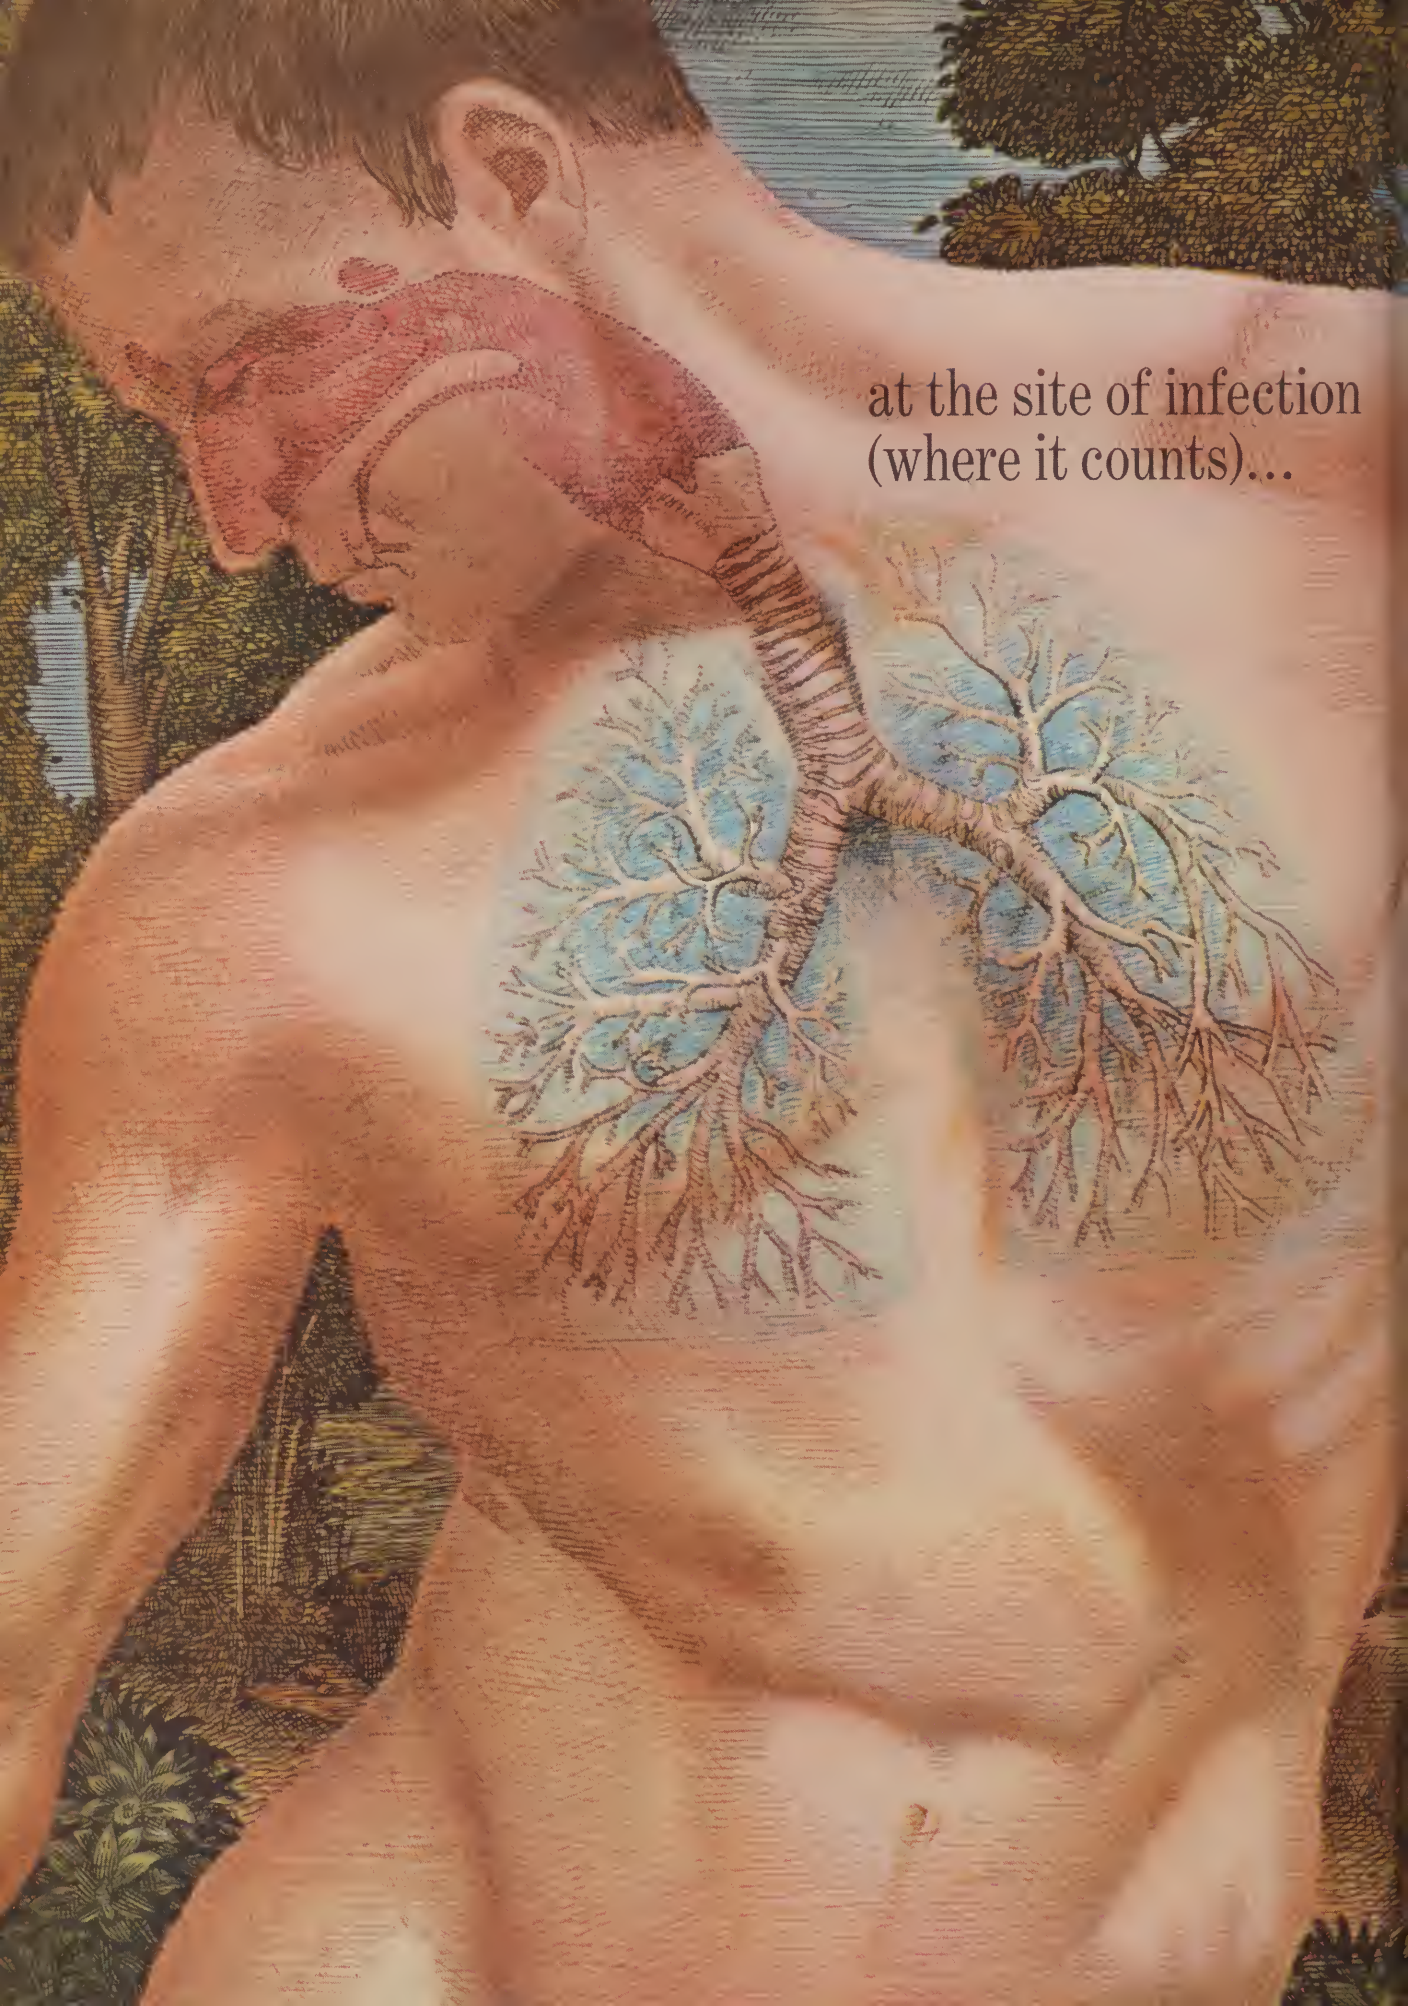
- **Encourages healing...**

  Softening of the colonic content with Metamucil allays abrasive pressure and congestion at denuded postsurgical sites.

- **And in nonsurgical conditions...**

  Metamucil minimizes both the pressure of strain on perineal structures and the physical irritation of hard masses on local lesions.

Usual Adult Dosage:



One rounded teaspoonful of Metamucil powder in a glass of cool liquid, or one packet of Instant Mix Metamucil in a glass of water. An additional glass of liquid is helpful.

Metamucil powder contains equal amounts of refined, purified psyllium and dextrose furnishing 14 calories and a negligible amount of sodium in each dose; available in containers of 4, 8 and 16 ounces.

Instant Mix Metamucil furnishes 3 calories and 0.25 Gm. of sodium in each dose; available in cartons of 16 and 30 single-dose packets.

SEARLE *Research in the Service of Medicine*

Chicago, Illinois 60680

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

700121

Ilosone®

Lilly

Erythromycin Estolate

(See next page for prescribing information.)

Ilosone®/ the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by microorganisms sensitive to its action (especially staphylococci, hemolytic streptococci, and pneumococci). The drug is therefore useful in a high proportion of bacterial diseases encountered in clinical practice and particularly in the treatment of bacterial infections of the upper and lower respiratory tract and soft tissues.

In the treatment of acute bacterial pharyngitis and tonsillitis, this antibiotic has promptly eradicated the bacteria (streptococci) and has produced a parallel prompt clinical improvement. There have been no group A beta-hemolytic streptococci resistant to this preparation. In beta-hemolytic streptococcus infections, treatment should be maintained for ten days to prevent the development of rheumatic fever or glomerulonephritis.

Erythromycin estolate has proved to be very effective in pneumococcus pneumonia and in acute bronchitis with pneumococci on culture. Bronchopneumonia and otitis media in children have responded well to its use.

The antibiotic has been used very successfully in staphylococcus infections. Good therapeutic results have been obtained in soft-tissue infections, abscesses, cellulitis, carbuncles, wound infections, and furunculosis.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents. As is the case with any treatment regimen used in these severe conditions, surgical procedures should be performed when indicated, and large dosages of the antimicrobial agents should be employed. In this fashion, Ilosone has been effective in staphylococcus pneumonia, osteomyelitis, septicemia, empyema, and meningitis.

Multiple 500-mg. doses of the drug have been useful in gonorrhea and syphilis. Since penicillin is the drug of choice for the treatment of syphilis and gonorrhea, erythromycin estolate should be employed for these infections only in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients known to be hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

Side-Effects: Data obtained from seven years' use of propionyl erythromycin ester and erythromycin estolate (Ilosone) indicate that hepatic dysfunction with or without clinical jaundice may occur during or following courses of therapy with the drug.

Changes in liver function tests in such cases have been indicative of intrahepatic cholestasis. The symptoms appear to be the result of a form of sensitization. The initial symptoms have appeared in some cases after a few days of treatment but generally have followed one or two weeks of continuous therapy or several courses of the drug. Symptoms reappear promptly if the drug is readministered to sensitive patients, usually within forty-eight hours. Eosinophilia was noted in peripheral blood counts. The findings readily subsided without apparent residual effects when treatment was discontinued. Recovery was delayed in one reported instance. The physician indicated in this case that either drug-induced jaundice or viral hepatitis may have been responsible for the findings.

In one clinical study involving ninety-three patients treated with the antibiotic, three cases of jaundice were observed and an additional eleven cases developed some changes in liver function tests. Three of the patients had abnormal liver function tests a second time on readministration of the drug.

Even though it is assumed that not all cases of jaundice have been reported, it seems clear that the number is small compared with the amount of drug that has been used. Reported cases have included persons in whom there had been administered other drugs known to be associated at times with hepatic side-effects and cases in which the presence of viral hepatitis or other disease may have been responsible for the findings. In some of the cases, associated gastro-intestinal symptoms simulated the colic of biliary tract disease. In other instances, clinical symptoms and results of liver function tests resembled findings in extrahepatic obstructive jaundice. It appears that the occurrence of jaundice after administration of Ilosone is infrequent, but further investigations are being made to estimate its incidence more accurately.

In those cases mentioned above in which jaundice appeared to be definitely related to use of the drug, laboratory findings were characterized by increased direct-reacting bilirubin, elevated alkaline phosphatase levels, negative or weakly positive cephalin flocculation and thymol turbidity tests, elevated serum glutamic oxalacetic transaminase levels, peripheral eosinophilia, and normal cholecystograms.

Individual idiosyncrasy seems evident since jaundice has not been reported in other patients taking prolonged courses of the medication. Patients with chronic infection have been given 1 to 2 Gm. of the drug daily for periods of two to six months, and patients with rheumatic fever have taken prophylactic doses of 0.5 Gm. daily for two years without difficulty. In one group of 144 patients who received the drug daily for two years, no jaundice was noted. It was of interest that members of six of the patients' families, who were not taking the drug, had episodes of jaundice during the study period.

Transaminase and serum alkaline phosphatase levels were determined in a group of fifty-four adults and children who took 250 mg. of Ilosone daily for an average of sixteen months as rheumatic fever prophylaxis. The results were compared with those of a similar group of forty-four patients who received penicillin. There were no cases of jaundice in either group. Elevations of SGPT and serum alkaline phosphatase levels during the course of treatment was observed in one patient treated with Ilosone and in two patients treated with penicillin. Seven other patients in the group receiving Ilosone and four others in the penicillin group showed elevations in one of the tests at some time during administration of the drugs.

Very satisfactory therapeutic results, without toxicity, were reported in 102 pediatric patients who received short-term (ten day) courses of Ilosone in the treatment of streptococcus infections. Results of liver function tests in these patients were comparable to those in a similar control group who had received penicillin.

Gastro-intestinal disturbances not associated with hepatic effects are observed in a small proportion of individuals as a result of a local stimulating effect of the medication on the alimentary tract; however, the normal intestinal gram-negative bacterial flora is not appreciably altered by erythromycin drugs.

Although allergic manifestations are uncommon with the use of erythromycin, there have been occasional reports of urticaria, skin eruptions, and, on rare occasions, anaphylaxis.

Administration and Dosage: Ilosone is administered orally.

Ilosone Pulvules®
Ilosone Chewable Tablets
Ilosone Drops
Ilosone, 125, for Oral Suspension

For infants and for children under twenty-five pounds of body weight, the usual dosage is 5 mg. per pound every six hours; for children twenty-five to fifty pounds, 125 mg. every six hours. (Tablets Ilosone Chewable should be chewed or crushed and swallowed with water.)

For adults and for children over fifty pounds, the usual dosage of Ilosone is 250 mg. every six hours.

For severe infections, these dosages may be doubled.

When larger doses are indicated, parenteral erythromycin therapy should be considered.

In the treatment of syphilis, the recommended total dosage is 20 to 30 Gm. given in divided doses for a period of ten to fifteen days. Close follow-up of the patient is necessary since erythromycin drugs have not had adequate evaluation in all stages of syphilis. Examinations of spinal fluid are recommended as part of the follow-up therapy.

For gonorrhea, 500 mg. four times a day for four days is recommended. In the treatment of gonorrhea, patients with a suspected lesion of syphilis should have a dark-field examination before receiving antibiotics, and monthly serologic tests should be made for a period of three months.

How Supplied: Pulvules Ilosone, Capsules, N.F., 125 and 250 mg. (equivalent to base), in bottles of 24 and 100.

Tablets Ilosone Chewable, N.F., 125 mg. (equivalent to base) in bottles of 50.

Ilosone Drops, 5 mg. (equivalent to base) per drop, in 10-cc. size packages, with dropper calibrated at 25 and 50 mg.

Ilosone, 125, for Oral Suspension, N.F., 125 mg. (equivalent to base) per 5-cc. teaspoonful, in 60 and 150-cc.-size packages.

COMPONENT MEDICAL SOCIETIES

BALTIMORE CITY

All members of the board of directors of the Baltimore City Medical Society were present for the monthly meeting held on March 14 at 1211 Cathedral Street and conducted by **Harry J. Connolly, MD,** president of the Society.

William F. Pearce, MD, and **Leonard G. Hamberry, MD,** representing the Baltimore Civil Service Commission, brought to the attention of the board the differences in physicians' opinions often encountered in workmen's compensation cases. It was proposed by the board that a panel of physicians be formed for the purpose of arbitrating such differences. **Arthur Siwinski, MD,** suggested, and the board agreed, that such a step would require a legislative change; that the help of the Society's Legislative Committee and of the City Solicitor should therefore be enlisted to formulate the basis for a possible "bill"; and that their recommendations should be presented to the board of directors for final approval prior to the submission of such a bill for legislative action.

The aid of the BCMS was sought by **F. J. L. Blasingame, MD,** executive vice-president of the American Medical Association, in the form of a letter concerning "Health Manpower." Recognizing the need for an organized program, but aware of several such programs presently in operation, the board agreed that information should be gathered on what has already been established in order to determine how the Society can serve in the most efficient capacity.

Correspondence on the statewide measles immunization program between the Society and **Robert E. Farber, MD,** health commissioner of Baltimore City, was reviewed, and it was announced that a BCMS committee, of which **Donald W. Mintzer, MD,** is chairman, has already been formed to enlist the aid of city physicians in administering the vaccine. The Baltimore City Health Department will assist in the organization of the city campaign.

The need to update the file of physicians for referral purposes in handling public inquiries was discussed in detail. The board voted for continued use of a questionnaire for this project, but revised the questionnaire. . . . The recommendation to the Governor of **Herman Seidel, MD,** for reappointment to the Commission on the Problems of the Aging was unanimously approved. . . . The board directed that a letter be sent to *The Baltimore Sun* voicing disapproval of the distortion of facts in a recent article reporting the proceedings at the BCMS business meeting on March 3.

Arthur E. Cocco, MD
BCMS Representative to The Journal

WASHINGTON COUNTY

The Washington County Medical Society held its regular meeting at the Venice Restaurant on Thursday, March 16. The guest speaker was **C. Ronald Koons, MD,** a physician at The Johns Hopkins Hospital and instructor of medicine and radiology at The Johns Hopkins University School of Medicine. His topic was "Newer Aspects in Cancer Chemotherapy."

* * * * *

John C. Stauffer, MD, chairman of the Public Health and Legislation Committee, and members of his committee will meet with **Perry Stearns, MD,** acting county health officer, to formulate plans for the forthcoming Measles Immunization Sunday, May 21, 1967.

* * * * *

New members: **Rizalito Amarillo, MD,** general practice, Sharpsburg, Md.; **Percy Miller, MD,** chief of physical medicine and rehabilitation at Western Maryland State Hospital; **Andrew Mandell, MD,** general practice; and **Edwin Riley, MD,** staff physician at Western Maryland State Hospital, a transfer from Caroline County Medical Society.

A Day Care Center in an Institutional Setting—Rosewood State Hospital

AVRUM S. SHAVRICK, MEd
Principal, Rosewood State Hospital

A day care program for retarded children may serve the educable, the trainable, or the totally dependent (severely retarded), or it may attune its services to two or even three of these categories. Usually its purpose is to offer training not already available in the community through public or private facilities such as schools and nurseries. The rationale for a day care program is derived from two major goals—to serve the child and to assist the parents. The philosophy thus concurs with the thinking of Baumstein,[1] Jubenville[2] and other authorities. The child, through a program developed to meet his needs, is helped to reach his highest potential. His participation in planned activities assists him in becoming more self-sufficient and more effective as an individual. He has the opportunity to compete only with himself, rather than with his sisters, brothers, and even the neighbors.[3]

Concurrently, the family derives multiple benefits: Parents of retarded children shoulder a heavy responsibility; their children will remain dependent for a long period of time, perhaps all of their lives. Regrettably, they usually cannot look forward to the child's complete independence as can parents of normal children.[4] A day care center relieves the family of the 24-hour intensive supervision and care most of these retarded children require. As a result of having the child out of the home for several hours daily, the family is able, in some instances, to keep the young child at home, rather than seek residential placement in a facility, public or private, away from home. In addition, such a center often affords the parents their first real opportunity to assess their child objectively in relation to his retarded peers. Finally, family counselling, which is an integral part of a sound day care program, assists the parents in evaluating the child's potential and in reappraising the effect of the retardate on both parents and siblings.

Day care as a propitious service for retarded children is a relatively new concept in the program structure at Rosewood State Hospital, a residential institution for the mentally retarded located at Owings Mills, Md. A Day Care and Developmental Center was established in April 1961 as an adjunct to the Hospital's school for more than 400 youngsters who have IQs of 25 to 70 and who range in age from pre-school to teen years. Six young retarded children from the community, who could not be placed in existing local facilities, were enrolled in the pilot program. By February 1965, the number increased to its present enrollment of 12.

Eligibility criteria for the program are very flexible. Retarded children between 4½ and 10 years of age may enter. In general, the children reside within a 15-mile radius of the hospital. There are no tuition charges; however, the par-

ents are responsible for providing transportation, lunches, and some educational materials. No restriction is placed on degree of retardation, but the children must be at least partly ambulatory. Only those who are not admissible into other community facilities are accepted. The center operates during the regular school year from September through June, five days a week, from 9:30 AM to 2 PM. The ultimate aim of our program is to help each individual develop his full potential and be prepared socially, emotionally, and educationally to participate in and enjoy the programs in the community.

The Day Care Center offers a natural setting for parent education. Parent seminars are held once a month. These endeavor to guide the parents in a clear evaluation of their child's condition and in the setting of realistic goals both for their retarded child and for the family as a whole.[5, 6] Another facet of parent education is the dissemination of information on available community resources and facilities for both the retarded child and the family.

Parents are requested to observe and spend a day in the classroom at least twice a month. This observation has proven to be of invaluable service since it has enabled the parents to grasp more realistically the complexity of problems in the care and training of their child. It is the author's fervent belief that day care centers have come a long way in making programs meaningful and that the "baby sitting" connotation is gradually disappearing from the scene.

Volunteers play a vital role in the total program by providing meaningful recreational and educational activities, such as touring a farm[9] and taking trips into the community. Our volunteer program confirms the findings of several investigators[10] in demonstrating that there is often a marked improvement in the social skills and behavior of children drawn into activities by volunteers.

The Center also provides an opportunity for young pre-professional students to engage in field work. At the present time, a sophomore student from a local university is gaining useful experience in work with the retarded.

The children, their parents, and the staff of Rosewood's Day Care and Developmental Center have the advantage of utilizing other existing services of the hospital. Social workers, psychologists, and medical personnel are called upon as needed. This is truly a unique feature of the program and arises from the integration of the day program into a large residential facility.

An effectual staff is essential to a successful day care program. The teacher employed in a day center should be emotionally mature, have specialized training in early childhood education, have some experience in working with retarded children,[1] and be capable of communicating with parents and guiding them skillfully.

In a day care setting, it is highly desirable for the teacher to have freedom to organize the class according to the abilities and needs of the particular children in her group.[7] The teacher is the key factor in the educational process. In addition to her professional skills, she must be able to utilize the surrounding environment and adapt a wide variety of methods, tools, materials, and available space to meet the ever-changing needs of her pupils.[8]

The day care program is planned to include the pursuit of these sequential phases:

1. Observing the child's needs.
2. Planning a program which will satisfy these needs.
3. Putting the program into action.
4. Evaluating the progress of the child.

The classroom is bright and spacious. It is equipped with small tables and chairs and low open shelves for books and toys. Each child has his own marked locker. Adjoining this room is a sink with running water and a bathroom. Since the accent is on pre-school activities, the appurtenances are like those found in any other nursery school—dolls and accessories, crayons, clay, paint, books, blocks, balls, mobile toys, simple puzzles, and peg boards.

The children have the opportunity, in a very stimulating atmosphere, to work harmoniously together in a socializing situation and have the satisfaction of creating and constructing. All activities stress cooperation and turn-taking, and throughout the day every opportunity is taken to enhance growth in self-help and habit formation. All efforts are focused on helping the child to advance in self-care skills. Since progress is best assured in an environment where a child is enjoying happy experiences in a relaxed atmosphere,

equipment includes a record player, a piano, games, and rhythms. During each session the children receive speech and hearing training, and music, from specialists. Every activity is planned to introduce, stimulate, motivate, or provide practice in the skills which prepare for social acceptance and productive living in the school, home, and community. The program offers all of these facilities and skill-building activities and is soundly based on the thinking of Bateman,[11] Etz,[12] Kirk and Stevens,[13] Kirk and Johnson,[14] and Jubenville.[2]

There is, as there should be, heavy concentration on motor activities throughout each school day. The physical education program is geared to the development of large muscle activity to the fullest extent. The children have access to an outside play area which is large enough to provide general use of large muscles.[15] This area is enclosed so as to prevent youngsters from wandering away. Included in the enclosure is a paved area to enable the child to make full use of the mobile toys.

Many opportunities are afforded the youngsters in developing small muscle activity with the use of coordination materials, simple cutting with blunt scissors, and painting. Finger painting has been extremely popular with the children.

Once a skill has been mastered by the children, continued reenforcement, both in school and at home, is stressed. Too many times, such children are taken by the hand to the bathroom, for example, even after they have found independence in going alone. The parents, it is felt, are often guilty when it comes to instilling increasing independence in the severely retarded child. It is very difficult for parents to accept the fact that their retarded child has become semi-independent; they insist on doing everything for him.

At the end of each school day, the teacher meets with the parents for a few minutes to discuss briefly what they can do at home regarding reenforcement. Twice during the year, in September and in February, there is cooperative planning of the curriculum, and establishing of basic goals, by teacher, parents, principal, and psychologist.

Because defiant and inappropriate behavior in the classroom can be recognized, interpreted, and treated in a therapeutic manner,[16] in Rosewood's program the youngsters are reevaluated at fixed intervals by personnel of the psychology department.

Since the program's inception six years ago, 11 children have left the Center to attend other community facilities for retarded children. These facilities include public schools for trainable retardates, and private and residential schools.

In order to serve the needs of young retarded children and their parents, the Day Care and Developmental Center at Rosewood will continue to develop as an adjunct to community centers, for it is the community where total planning for the retardate should begin.

A day care facility can very often delay or even avoid residential placement for some children. It is generally believed that the institution can never supplant a mother's and a family's warmth and love for the child; consequently, the young child should remain in the home environment as long as possible, providing there is good home care and love for the child. The need for residential placement may be persistent and the demands great, but regardless of pressures used, home situations, if at all satisfactory, must be seen as the first preference for the young child.

At the present time, in our culture, the institution often carries negatory and very unpleasant connotations. This is one of the reasons why the residential placement of a child becomes a very disturbing, guilt-producing incident. A favorable experience in day placement in the same institution where the child may reside ultimately will go a long way toward reducing the emotional strain of such separation at a later date.

We recommend CAMP

SACRO-ILIAC SUPPORTS

Scientific block and tackle lacings cause the durable Camp material to firmly encircle the bony pelvis, in conservative treatment of sacro-iliac conditions. This basic Camp model also provides upper adjustment to balance the support or to ease spasm and pain, depending on the needs of the wearer. Effective for relief of effects of disease and moderate low back injury.

Been sued for a king's ransom lately?

(Save this ad. You may need it tomorrow if you don't today.)

The St. Paul "Top Brass" Policy is for people like you who, by profession, are vulnerable to heavy liability judgments. Not every insurance company offers this kind of policy; few cover so broadly.

You can now increase your Professional (and personal) Liability coverage by as much as $5,000,000. And you get extra "major medical" coverage in most cases at no extra cost.

Now our brochure about this policy is printed on what appears to be solid mahogany. The thought of wasting one of these brochures makes our thrifty souls twitch. (The same thrift which has kept us so solvent these 114 years.) So only if you feel you really need our "Top Brass" brochure . . . write for one.

(*How efficient are you?* Unload your entire bundle of insurance detail on one pair of knowledgeable shoulders: a St. Paul agent or broker. Write or call.)

For further information, or the name of your nearest St. Paul agent, please contact The St. Paul office at:

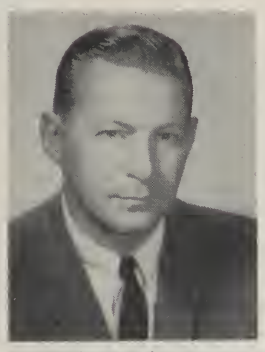
BUSINESS EXPENSE DISABILITY PROTECTION

Many physicians are not aware of the advantages in distinguishing between business expense and personal needs for insurance purposes.

WHY A DISTINCTION?



If a physician had a long term disability, in excess of a year, would he continue his practice and his business expenses: employees salaries, rent, telephone, utilities, contributions, business auto, etc., Obviously, few would. He certainly does not need "Long Term" disability benefits to protect this area!!

The Med-Chi Insurance Trust recognizing this problem has established the St. Paul Business Expense Disability Program as a companion to our Long Term Disability Income Program.

THE ADVANTAGES OF CARRYING BUSINESS EXPENSE DISABILITY PROTECTION ARE SUBSTANTIAL.

- Business Expense premiums are wholly **TAX-DEDUCTIBLE** (Internal Revenue Ruling 55-264, Rev. CB-11)
- **FIRST DAY COVERAGE**, Accident or Sickness, retroactive after the 30th day
- **FULL 100%** Payment Basis, i.e. **NO** averaging clause penalty
- Benefits paid regardless of any other insurance you may carry
- House confinement **NEVER** required, 24hr. coverage
- "Releases" higher cost long-term disability benefits
- Cost is much **LESS** than you would pay on an individual basis

DIARRHEA

CANTIL®
(mepenzolate bromide)

LAKESIDE

Diarrhea, one of the most vexing symptoms of common G. I. disorders can often be curbed with Cantil (mepenzolate bromide), bringing welcome relief to the harassed patient. Relatively specific for the hyperactive colon, it helps reduce diarrhea, pain and spasm with minimal effect on other viscera. Cantil (mepenzolate bromide) is indicated whenever these symptoms are associated with irritable colon, gastroenteritis, diverticulitis, and mild to moderate ulcerative colitis.

It is an anticholinergic drug without narcotic properties. Side effects are usually mild.

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth, blurring of vision, constipation, nausea, vomiting, bloating and dizziness may occur but are usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy — withhold in glaucoma. Contraindicated in patients sensitive to phenobarbital and/or Cantil (mepenzolate bromide); in toxic megacolon, obstruction of G. I. or G. U. tract.

SUPPLIED: CANTIL (mepenzolate bromide) — 25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL — containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

UP TO 10-12 HOURS' CLEAR BREATHING ON ONE TABLET

Dimetapp® Extentabs®

(Dimetane® [brompheniramine maleate], 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.)

…usitis, colds, or U.R.I., …imetapp lets congested patients …reathe easy again. Each Extentab …rings welcome relief all day or all night, …surely without drowsiness or over-…stimulation. Its key to success? The …imetapp formula—Dimetane (brom-…heniramine maleate), a potent anti-…histamine reported in one study to have …licked side effects as few as the placebo,* …eamed with decongestants phenyl-…ephrine and phenylpropanolamine—…a dependable 10- to 12-hour form.

*…ch, I. W., and Lowell, F. C.: New England …M. 261:478, 1959.

Contraindications: Patients hypersensitive to antihistamines. Not recommended for use during pregnancy.

Precautions: Until the patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.

Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability, or excitement may be encountered.

Dosage: 1 Extentab morning and evening, or as needed.

Supplied: Bottles of 100 and 500.

Also available: Dimetapp® Elixir for conventional *t.i.d.* or *q.i.d.* dosage. See package insert for further details.

V-Cillin K® Lilly 700157

Potassium Phenoxymethyl Penicillin

(See next page for prescribing information.)

New 500 mg. tablets...a more convenient way to give high doses

Description: V-Cillin K is the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly). This chemically improved form combines acid stability with immediate solubility and rapid absorption. Higher serum levels are obtained more rapidly with this penicillin than with equal oral doses of penicillin G. The higher serum levels and acid stability of V-Cillin K make it a more dependable penicillin for oral use.

V-Cillin K, Pediatric, is an oral solution of clinically proved V-Cillin K in teaspoon dosage form. When mixed as directed, each 5 cc. (approximately one teaspoonful) will contain 125 mg. (200,000 units) phenoxymethyl penicillin as the potassium salt.

Indications: V-Cillin K has been shown to be effective in the treatment of streptococcus, pneumococcus, and gonococcus infections as well as infections caused by sensitive strains of staphylococci. It may be used for the prophylaxis of streptococcus infections in patients with a history of rheumatic fever and for the prevention of bacterial endocarditis after tonsillectomy and tooth extraction in those patients with a history of rheumatic fever or congenital heart disease.

Contraindication: V-Cillin K should not be administered to a patient with a history of penicillin hypersensitivity.

Precautions: V-Cillin K should be used cautiously, if at all, in a patient with a strongly positive history of allergy. Reactions occur more frequently in individuals with bronchial asthma or other allergies or in those who have previously demonstrated sensitivity to penicillin. If hypersensitivity reactions occur, the drug should be discontinued.

Adverse Reactions: Although serious allergic reactions are more less common with administration of oral penicillin than with intramuscular forms, skin rash, symptoms resembling those of serum sickness other manifestations of penicillin allergy may occur. When penicillin administered, measures for treating anaphylaxis should be readily available. Those include epinephrine, oxygen, and pressor drugs relief of immediate allergic manifestations as well as antihistamines and corticosteroids for delayed effects.

The use of antimicrobial agents may be associated with the overgrowth of antibiotic-resistant organisms; in such a case, antibiotic administration should be stopped and appropriate measures taken.

Administration and Dosage: For Tablets V-Cillin K and for V-Cillin K, Pediatric, the usual dosage ranges from 125 mg. (200,000 units) three times a day to 500 mg. (800,000 units) every four hours. For infants, the daily dosage may be 50 mg. per Kg. of body weight divided into three doses.

Beta-hemolytic streptococcus infections without associated bacteremia may be treated with 200,000 to 400,000 units three times a day. Therapy should be continued for a minimum of ten days to prevent development of rheumatic fever and/or other serious complications. The dosage for routine streptococcus prophylaxis in patients with a history of rheumatic fever or congenital heart disease may be 200,000 units once or twice daily. When such patients undergo tonsillectomy, tooth extraction, or other minor surgery, the prophylactic dose should be 500,000 units every six hours given two days prior to surgery and for two days postoperatively. If oral medication is not feasible on the day of surgery, parenteral therapy should be considered. Mild to moderately severe pneumococcus pneumonia has been treated effectively with 250 mg. every six hours.

In staphylococcus infections, 400,000 units or more should be given every six to eight hours in conjunction with indicated surgical procedures.

For gonorrhea in males, 500 mg. (800,000 units) every six hours three doses may be employed; in females, 500 mg. every four hours six doses are recommended. Patients with a suspected lesion of syphilis should have a dark-field examination before receiving penicillin and monthly serologic tests for a minimum of three months.

How Supplied: Tablets V-Cillin K, U.S.P., 125 mg. (200,000 units) bottles of 50 and 100; 250 mg. (400,000 units), and 500 mg. (800,000 units) in bottles of 24 and 100.

V-Cillin K, Pediatric, for Oral Solution, 125 mg. (200,000 units) 5 cc. of solution, in 40, 80, and 150-cc.-size packages.

Additional information available to physicians upon request. Eli Lilly and Company, Indianapolis, Indiana 46206.

REHABILITATION Notes

REHABILITATION SECTION
BALTIMORE CITY MEDICAL SOCIETY,

DOUGLAS G. CARROLL M.D.
EDITOR

Why Do You Prescribe Exercise, Doctor?

CLARA J. FLEISCHER, MD
Assistant Professor, Physical Medicine and Rehabilitation
University of Maryland School of Medicine

Frequently the doctor refers a patient to a physical therapist for "exercise." Does he have a clear concept of why he ordered this form of therapy? Is he familiar with different forms of exercise and what they are supposed to accomplish?

Therapeutic exercise is a scientific application of bodily movements in the treatment of disease or of malfunction of the musculoskeletal system. The prescription for therapeutic exercise is directed toward:

1. Correction of impairment of joint range of motion.[1]
2. Improvement of muscle function, strength, and endurance.[1]
3. Improvement of coordination.[1]
4. Maintenance of a state of wellbeing.[2]

The prescription will vary with the purpose for which it is prescribed and it is directly dependent upon the condition of the patient. An adequate medical evaluation is therefore essential. The prescription must include objective goals *and* precautions.

1. Correction of impairment of joint range of motion

Limitation of range of motion is produced by:

A. Immobilization
B. Edema
C. Trauma
D. Impaired circulation

To improve or restore range of motion of joints, we employ (1) passive exercise, (2) active assistive exercise, (3) active exercise:

Passive exercise (or relaxed movement): The operator or mechanical device moves a portion of the patient's body while the patient remains relaxed. This is primarily of value in the treatment or prevention of stiff joints. The procedure is also useful in the presence of contractures, scar tissues, and muscle paresis due to a central or a peripheral nerve lesion which makes voluntary movement impossible. It will *not* hypertrophy the muscle fibers or improve peripheral circulation.

Active assistive exercise: This involves the initiation of the movement by the patient with the assistance of the therapist or mechanical devices, such as pulleys, to encourage full range of motion. This type of exercise will produce a gradual increase in joint and muscle efficiency.

Active (or free) exercise: The patient performs the movement himself against the resistance of gravity. This form of exercise not only improves the range of motion, but it also improves the muscular function, although not

LOOK TO THE ULTIMATE IN NURSING HOMES

What makes Community Health Facilities *different and better* than other nursing homes in Maryland? The main reason they stand out from all the other homes is that these nine health institutions are made up of skilled people whose entire lives are devoted to the profession of helping others. These pepole are interested concerned and thoroughly conscientious regarding every guest they have. At a Community Health Facility, each and every guest receives personalized individual care that guarantees them a pleasant stay whether they are receiving convalescing or restorative long term rehabilitative care.

COMMUNITY HEALTH FACILITIES FEATURE:

- Registered Nurses—24 hour nursing care
- Open medical staff—your doctor continues to care for you
- Special diets under the supervision of an Accredited Dietician
- Modern hospital equipment—Oxygen, Intravenous, Suction Therapy
- Physical Therapy Available
- Air Conditioning Available
- Religious Services
- Recreational Areas
- Separate Units provide separation of convalescent from sicker patient
- True convalescent section—Intensive are Unit
- And *best of all . . . attractive and sensible rates*

necessarily the strength.

2. Improvement of muscle function, strength, and endurance

The impairment of muscle function may be due to:

A. Disuse atrophy—inactivity or immobilization produces atrophy or reduction in size of muscle fibers rendering them functionally inefficient. Progressive resistive exercises will produce hypertrophy in muscles atrophied by disuse.

B. Paralytic atrophy—disease of, or damage to, part or all of the motor unit will produce a reduction in the size and number of muscle fibers. Progressive resistive exercises will hypertrophy only those fibers in which the motor unit is intact or recovered.

C. Misuse of muscles—fatigue, which by definition is a reduction in ability of the muscles to respond to a stimulus, is caused by depletion of chemical reserves and accumulation of waste products of muscle metabolism. It is a transitory state capable of recovery after rest. In treating failing muscular function, three major qualities of muscular performance should be developed: (1) power or strength, (2) endurance and (3) speed.

Power or strength is produced by resistive exercise: Here the patient uses his muscles against an opposing force supplied either manually by the therapist, or mechanically by weights or springs. It is generally accepted that active contraction of muscles causes marked increases in local blood flow in response to elevated metabolic needs of the tissues. Repeated active exercise, gradually increasing in intensity, will help to prevent atrophy and may contribute to hypertrophy of working muscles. It also counteracts the state of debilitation which inevitably follows prolonged bed rest. As a result, the negative nitrogen balance and the loss of vasomotor control over the blood vessels in the lower extremities is minimized. The improved circulation to bone and joint structures will have beneficial action in prevention of osteoporosis, contractures, and ankylosis. To increase muscle power or strength, one must gradually increase the work load of the muscle by providing resistance against the range of motion. Dr. DeLorme has shown that increased strength does not necessarily mean increased endurance.[3]

Endurance is improved only by repetition. Exercises performed with a low number of repetitions and increased work load will improve power *and* endurance.

Speed is gained by gradually increasing the number of repetitions per unit of time.

3. Improvement of coordination

Coordination is a combination of activities of a number of muscles in a smooth pattern. Ordinarily these movements are automatic. Control of coordinated activities is monitored primarily through the feed-back of sensory stimuli transmitted through proprioceptive pathways. Occasionally they are monitored by visual and tactile stimuli. Development of coordination depends upon the repetition of precisely performed patterns. The activity must be slow and precise. These activities are done many times and the speed of performance is gradually increased. All skilled muscular activities are developed in this manner.

4. Maintenance of a state of wellbeing

A so-called "normal" individual, or one who has a disease of an organ but no involvement of the neuro-musculoskeletal system, may require exercise for "physical fitness." The previously discussed factors of speed, strength, endurance, and coordination[2] are requirements of physical fitness and their degree is related to an organically sound body, ability to perform moderate and strenuous work, and ability to perform specific skills. In developing physical fitness, one must take into consideration the physiologic reactions of the body at different ages, the daily work performed by the individual, and the best exercise for the age of that person.

Only the basic concepts of exercise have been outlined here. It is to be hoped that future articles will discuss exercise in specific diseases, such as arthritis, pulmonary disease, heart and vascular disease, various orthopedic disorders, postural exercise, and exercise for specific neuromuscular disorders.

Tandearil®
oxyphenbutazone

helps osteoarthritic joints move again

3 out of 4 osteoarthritics completely or markedly improved

Sperling, I.L.: 3 Years' Experience with Oxyphenbutazone in the Treatment of Rheumatic Disorders, Applied Therapeutics 6:117, 1964.	76.9% of 407 patients
Watts, T.W., Jr.: Treatment of Rheumatoid Disorders with Oxyphenbutazone, Clin. Med. 73:65, 1966.	84.6% of 39 patients

Please see adjoining page for brief prescribing summary

TA-4919 PC

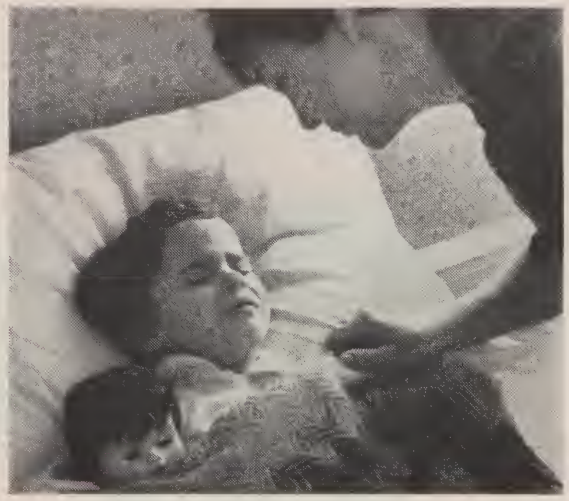
Tandearil®
oxyphenbutazone

Therapeutic Effects: Tandearil is a nonhormonal compound which may rapidly resolve inflammation and help restore normal joint function. Its action does not affect pituitary-adrenal function or impair immune responses. Its value in osteoarthritis is especially noteworthy because this disorder responds inconsistently to steroids and is often resistant to salicylates. Further, indomethacin is limited only to osteoarthritis of the hip, whereas oxyphenbutazone is effective in all forms of the disease.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.

Precautions: Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should be closely supervised and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage. Make regular blood counts. Discontinue the drug and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.



Adverse Reactions: The most common are nausea, edema and drug rash. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, or a generalized allergic reaction may occur and require withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Osteoarthritis: The initial daily dosage in adults is 300-600 mg. in divided daily doses. When improvement occurs, dosage should be decreased to the minimum effective level; this should not exceed 400 mg. daily, and is often achieved with only 100-200 mg. daily.

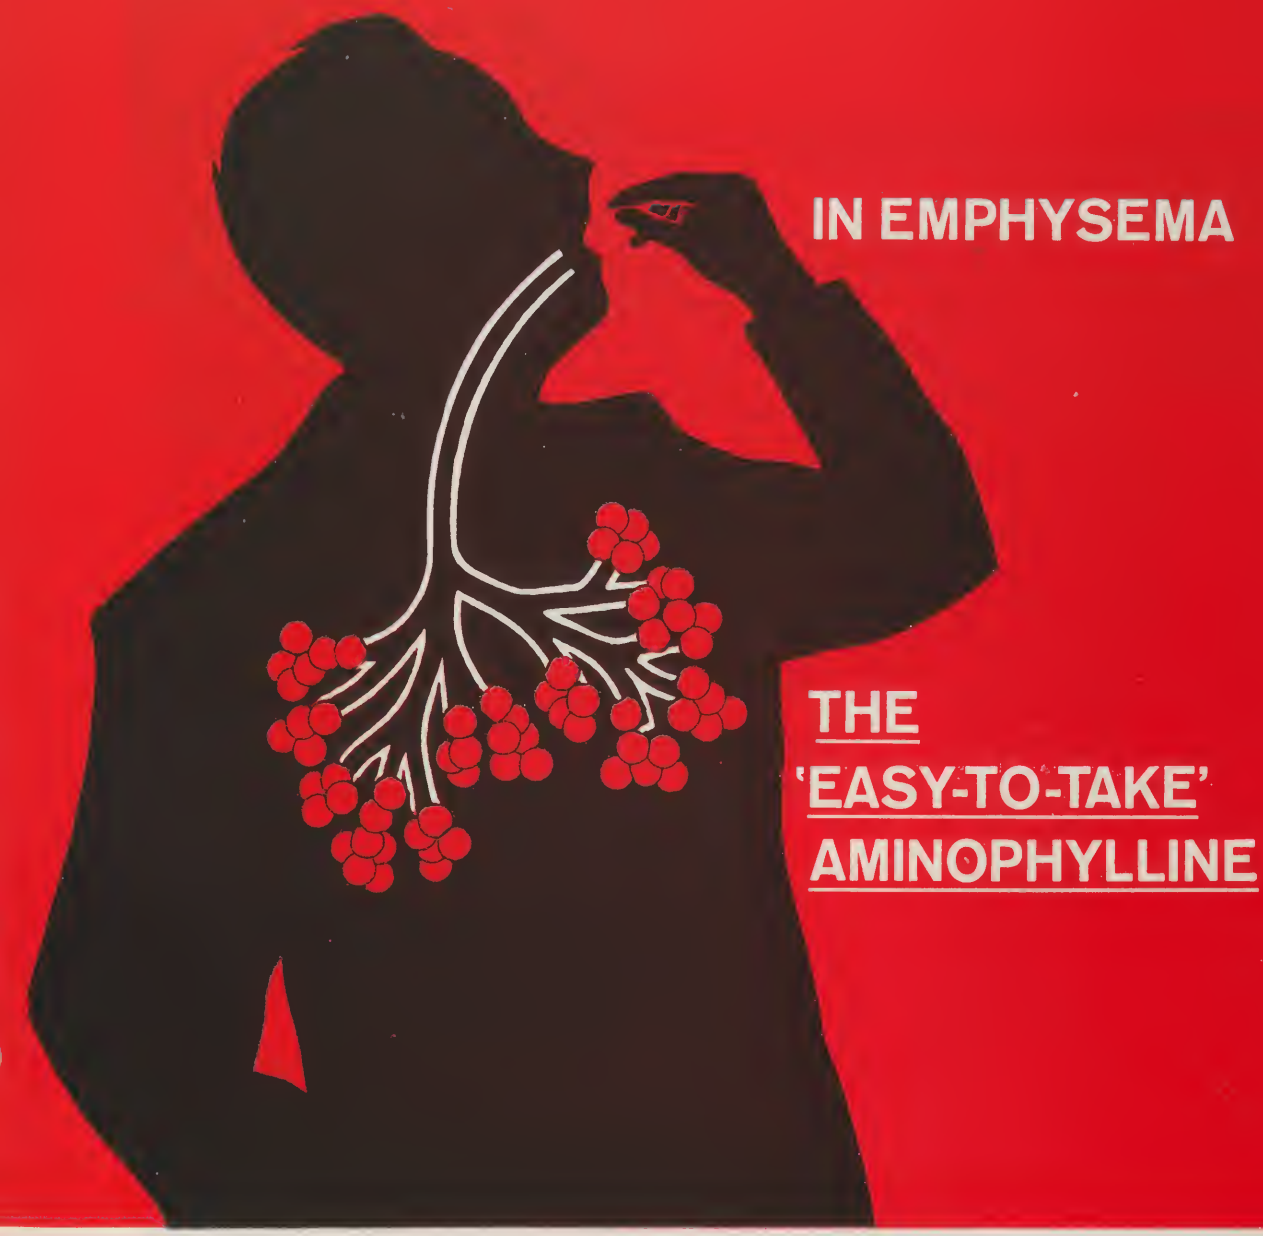
For complete details, please refer to full prescribing information. 6562-VI(B)R

Availability: Tablets of 100 mg.

Geigy
Geigy Pharmaceuticals
Division of Geigy Chemical Corporation
Ardsley, New York

One by one the family's downed Because the G.I. bug's around

Parepectolin for quick relief of acute diarrhea
...soothes colicky pain with paregoric*
...consolidates fluid stools with pectin
...adsorbs irritants with kaolin,
and protects intestinal mucosa



Whether it's a 24-hour "bug", a food problem, or simply nervousness and anxiety, Parepectolin will bring the diarrhea under control until etiology can be determined. In some cases, Parepectolin may be all the therapy necessary.

Parepectolin®

Each fluid ounce of creamy white suspension contains:
*Paregoric (equivalent) ..... (1.0 dram) 3.7 ml.
Contains opium (¼ grain) 15 mg. per fluid ounce.
warning: may be habit forming
Pectin ..... (2½ grains) 162 mg.
Kaolin (specially purified) .... (85 grains) 5.5 Gm.
(alcohol 0.69%)
Usual Adult Dose: One or two tablespoonfuls three times daily.
Usual Children's Dose: One or two teaspoonfuls three times daily.

ROER

WILLIAM H. RORER, INC.
Fort Washington, Pa.

IN EMPHYSEMA

THE 'EASY-TO-TAKE' AMINOPHYLLINE

Aminophylline dura-tabs®

prolonged-medication tablets 4½ gr. (0.3 Gm.)

Precautions: Use with caution in patients with poor renal function as a decreased rate of excretion may lead to accumulation and untoward reactions. Gastric irritation may occasionally be observed in certain patients sensitive to oral aminophylline.

Dosage: Adults, 1 to 2 Aminophylline Dura-Tabs each 8 or 12 hours, with food.

RARELY UPSET THE STOMACH

Oral aminophylline needn't disturb the stomach—nor a good night's sleep. Patients breathe easier all day, sleep better all night, as each Aminophylline Dura-Tab dose provides effective therapeutic activity for up to 12 hours. And unlike conventional tablets, AMINOPHYLLINE DURA-TABS seldom cause gastric distress. The special Dura-Tab process allows the gradual absorption of the medication from the intestinal tract with only a small fraction of the dose released in the stomach.

STATE OF MARYLAND

Department of Mental Hygiene

Isadore Tuerk, MD, Commissioner

Kurt Gorwitz, ScD, Statistics Director

Maryland's Privately Operated Psychiatric Hospitals*

Fifteen percent of all psychiatric inpatient admissions in Maryland last year were to the eight privately operated hospitals although these provide less than nine percent of available beds. A slightly smaller number were reported to the Psychiatric Case Register as having been admitted to the VA Hospital at Perry Point and to other units not affiliated with the Department. The remaining 70% were to the six State psychiatric hospitals operated by the Department of Mental Hygiene. Patient movement data for the year ending June 30, 1966 are summarized in the following table.

TYPE OF FACILITY	Resident Patient Population 7-1-65	Admissions During Year**	Discharges During Year**	Deaths During Year	Resident Patient Population 6-30-66
DMH Operated	8,293	9,675	8,706	1,029	8,178
Privately Operated	929	2,233	2,261	24	877
Other Inpatient***	1,373	2,102	1,758	90	1,627
Total	10,595	14,010	12,725	1,143	10,682

Proportionally, Maryland has always had a substantial segment of its psychiatric patient population treated in privately operated facilities. One of these, the Seton Institute, has been in continuous existence for more than one hundred years. It is mentioned by Albert Deutsch in his book "The Mentally Ill In America" as one of the oldest psychiatric hospitals in the United States. This history of service is exceeded in Maryland only by the Spring Grove State Hospital. The number of these private hospitals has declined in recent years due to the closing of Cedarcroft, Laurel and other facilities because of personnel shortages and other related problems. There have been no replacements although a number of existing hospitals have increased their bed capacity. Several have also developed outpatient programs.

Traditionally, the relatively high cost of hospital care in these private facilities has produced a patient population with an excess of individuals with the following characteristics: white, female, in the middle years of life (25-54), middle and upper middle class, admitted for the short term treatment of acute nonpsychotic disturbances. In more recent years the inclusion of psychiatric care in health insurance programs has greatly broadened this population pool. At the same time, tranquilizing drugs and the development of new treatment concepts and services have produced

major changes in patterns of hospitalization, retention and release of state hospital patients.

Thus, individuals entering public or private psychiatric hospitals are now more comparable than they have been in past years. The quality and type of services received during hospitalization is now also more similar. Continuation of this trend should produce greater coordination of programs. It should also be an important factor in providing needed psychiatric services to all segments of the population.

"Livingston...vertigo is my doom!"
Cried Stanley in his doctor's room.

Said the doc, "For your ills
I've got just the pills."

Said Stan,
"Antivert, I presume."

Antivert® tablets/syrup Roerig stops vertigo
(meclizine HCl, niacin)

Tablets: (meclizine HCl 12.5 mg. and niacin 50 mg.) Syrup: (each 5 cc. teaspoonful contains meclizine HCl 6.25 mg. and niacin 25 mg.)

Most widely prescribed anti-vertigo agent[1] Complete to moderate relief of symptoms in 9 out of 10 patients[2]

Antivert, the leading anti-vertigo product,[1] combines meclizine HCl, an outstanding drug for treatment of vestibular dysfunction, with niacin, a drug of choice for prompt vasodilation. Prescribe Antivert for your patients with vertigo, Meniere's syndrome and allied disorders.

Precautions and contraindications: Frequent, short-lived reactions include: cutaneous flushing, sensations of warmth, tingling and itching, burning of skin, increased gastrointestinal motility, and sebaceous gland activity. In explaining these reactions to the patient, it is suggested that they be regarded as a desirable physiological sign that the niacin is carrying out its intended function of vasodilation. Because of this vasodilation, severe hypotension and hemorrhage are obvious contraindications to Antivert therapy. Although the incidence of drowsiness and other atropine-like side effects such as dry mouth and blurring of vision is low, the physician should alert the patient to the need for due precautions when engaging in activities where alertness is mandatory. **Use in women of childbearing age:** A review of available animal data reveals that meclizine exerts a teratogenic response in the rat. In one study a dose of 50 mg./kg./day (50 times the maximum recommended human dose) produced cleft palate in 2 of 87 fetuses when administered to the rat at critical times during the first 15 days of gestation. At doses of 125 mg./kg./day, meclizine will produce 100% incidence of cleft palate in the rat. At doses of 25 mg./kg./day, decreased calcification of the vertebrae and relative shortening of the limbs were also produced in the rat, but experts disagree as to whether this is a teratogenic response. While available clinical data are inconclusive, scientific experts are of the opinion that this drug may possess a potential for adverse effects on the human fetus. Consequently, consideration should be given to initial use of a nonphenothiazine agent that is not suspected of having a teratogenic potential. In any case, the dosage and duration of treatment should be kept to a minimum. **Dosage:** One tablet or one to two teaspoonfuls (5-10 cc.) t.i.d. just before meals. Specific requirements for individual patients should be determined by the physician. **Supplied:** Tablets in bottles of 100 and 500. Syrup in pint bottles. RX only.

Neobon® geriatric + supplement
helps keep them 'on the go'

Each capsule contains:

(1) **Vitamins and Minerals**	
Vitamin A (acetate)	2000 U.S.P. units
Vitamin D (ergocalciferol, U.S.P.)	200 U.S.P. units
Vitamin B_1 (thiamine mononitrate, U.S.P.)	0.5 mg.
Vitamin B_2 (riboflavin, U.S.P.)	0.5 mg.
Vitamin B_6 (pyridoxine HCl, U.S.P.)	0.5 mg.
Niacinamide, U.S.P.	50 mg.
Calcium pantothenate, U.S.P.	5 mg.
Vitamin E (di-alpha tocopheryl acetate)	5 I.U.
Rutin	5 mg.
Cobalt (from cobalt sulfate)	0.033 mg.
Molybdenum (from sodium molybdate)	0.066 mg.
Copper (from copper sulfate)	0.33 mg.
Manganese (from manganese sulfate)	0.33 mg.
Magnesium (from magnesium sulfate)	2 mg.
Iodine (from potassium iodide)	0.05 mg.
Potassium (from potassium sulfate)	1.66 mg.
Zinc (from zinc sulfate)	0.4 mg.
(2) **Hematopoietic Factors**	
Iron (from ferrous sulfate)	3.40 mg.
Vitamin B_{12} (cobalamin concentrate, N.F., as Stablets®)	1 mcg.
Vitamin C (ascorbic acid, U.S.P.)	50 mg.
(3) **Digestive Enzyme**	
Pancreatic substance*	50 mg.
(4) **Gonadal Hormones**	
Methyltestosterone, N.F.	1.0 mg.
Ethinyl Estradiol, U.S.P.	0.006 mg.
(5) **Amino Acids**	
L-lysine (monohydrochloride)	50 mg.
L-Glutamic acid	30 mg.

*Enzymatically active defatted material obtained from 250 mg. of whole fresh pancreas.

For older adults who require it, daily supplementation with Neobon can help overcome decreases in endogenous gonadal hormone production, as well as deficiencies of iron, vitamins and other nutritional factors. In a single convenient capsule, Neobon provides vitamins, minerals, gonadal hormones, hematopoietic factors, digestive enzymes, and amino acids—all selected for adjunctive therapeutic value in the geriatric syndrome. For example, one of the gonadal hormones in Neobon is ethinyl estradiol. It is more slowly metabolized in the body than natural estrogens or their esters.

Precautions: Contraindicated in patients in whom estrogen or androgen therapy should not be used, as in carcinoma of the breast or prostate.

Dosage: One capsule, t.i.d. with meals, or as directed by physician.

Supplied: Bottles of 60 capsules. Rx only.

The battle with bacteria: cystitis

Artist's conception of cystoscopic view of bladder showing congested blood vessels and edema around ureteral orifice.

consider Gantanol (sulfamethoxazole)

For vigorous treatment of G.U. infections before the invaders become entrenched... Gantanol (sulfamethoxazole) offers a comprehensive spectrum of antibacterial effectiveness against most common gram-negative as well as gram-positive invaders. In addition, it provides satisfactory concentrations in he blood and urine with ready diffusion into interitial fluids for antibacterial activity at foci of bacterial ivasion.

igh antibacterial activity against *E. coli* and other comon urinary pathogens... A review of 153 cases of acute .U. infections reported in the literature shows that 90% responded to Gantanol (sulfamethoxazole), with over one-half of these patients showing excellent relief of symptoms.[1,2] Even in stubborn chronic G.U. infections, almost 60% of 450 patients improved on Gantanol (sulfamethoxazole), including many who had not responded to other antibacterials.[1-6]

Generally uncomplicated therapy enhances the favorable clinical results... Of the total 686 patients from the studies cited,[1-6] only three discontinued therapy because of side effects. Most of the side effects reported (approximately 3%) were mild and included nausea and/or vomiting, skin rash, dizziness, headache, gastritis, generalized uneasiness and itching.[1-6]

---

efore prescribing, please consult complete product formation, a summary of which follows:

ontraindicated in sulfonamide-sensitive patients, regnant females at term, premature infants, or newrn infants during first three months of life.

arnings: Use only after critical appraisal in patients ith liver damage, renal damage, urinary obstruction blood dyscrasias. If toxic or hypersensitivity reacons or blood dyscrasias occur, discontinue therapy. In termittent or prolonged therapy, blood counts and ver and kidney function tests should be performed.

recautions: Observe usual sulfonamide therapy preautions, including maintenance of an adequate fluid take. Use with caution in patients with histories of llergies and/or asthma. Patients with impaired renal nction should be followed closely since renal impairent may cause excessive drug accumulation. Occaonal failures may occur due to resistant microorganms. Not effective in virus or rickettsial infections.

dverse Reactions: Headache, nausea, vomiting, urtiaria, diarrhea, hepatitis, pancreatitis, blood dyscraas, neuropathy, drug fever, skin rash, Stevens-Johnson syndrome, injection of the conjunctiva and sclera, petechiae, purpura, hematuria or crystalluria may occur, in which case the dosage should be decreased or the drug withdrawn.

Dosage: Adults—4 tablets initially, then 2 tablets b.i.d. or t.i.d. depending upon severity of infection. Children —1 tablet/20 lbs initially, followed by ½ tablet/20 lbs b.i.d.

How Supplied: Tablets, 0.5 Gm, bottles of 50.

Gantanol®
(sulfamethoxazole)

Everyone says she's a barrel of fun

But what does she think?

Many overweight patients can benefit from the appetite control provided by the sustained anorexigenic-tranquilizing action of BAMADEX SEQUELS: anorexigenic action of amphetamine; tranquilizing action of meprobamate; prolonged action through sustained release of active ingredients.

Bamadex® Sequels®

DEXTRO-AMPHETAMINE SULFATE (15 mg.) WITH MEPROBAMATE (300 mg.) SUSTAINED RELEASE CAPSULES

to help establish a new dietary pattern

Contraindications: Dextro-amphetamine sulfate: in hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathamimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amaunts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcahalics, former addicts, and other severe psychoneurotics, has been reported to result in dependence an the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation af motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcahol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities ta patients with suicidal tendencies.

Side Effects: Overstimulation af the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinatians have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may accur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dase, or by concomitant administratian of central stimulants. Allergic or idiosyncratic reactians: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case af fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneuratic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, practitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but anly when other drugs known to elicit these conditions were given concamitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

The Alcoholic and the Physician

RICHARD S. COOK, MD
Chief, Division of Alcoholism
Illinois Department of Mental Health

While there is much discussion about the diagnosis of alcoholism, a physician usually can determine from the history, as given by the patient or by the patient's family, if he is dealing with alcoholism. Typically, there is an account of excessive drinking, unpredictable use of alcoholic beverages, with consequences which disrupt the patient's family life or his employment or which indicate some impairment of health as a result of his drinking. The drinking has progressed to being recurrently troublesome. Friends and relatives have evolved a sort of common-sense effort, urging, pleading, threatening, and have gone along with many new starts before any professional consultation is sought.

It does happen that a family or patient consults a doctor because the situation regarding drinking is beginning to get out of hand, and there may be a question about calling the condition alcoholism or heavy social drinking.

It is not my purpose to review the various medical complications of alcoholism except to comment that in such conditions as severely agitated states with hallucinations, coma, or convulsions, one must think of alcoholism in the differential diagnosis. Conversely, when a known alcoholic is lying on the floor or street unconscious, it is not safe to assume that he is merely in an alcoholic stupor. He may be unconscious because of severe head injury or other pathological state.

Alcoholism is the fourth ranking public health problem in the United States, there being an estimated five and a half to six million alcoholics. For example, in Illinois there are probably around 375,000, at least half of whom are in Cook county. They tend to be, of course, larger in numbers around cities. Of this group, only about 3% are found on Skid Row, so if there is an assumption that the problem is mainly among the unemployed derelicts, it is far from the truth.

It is thought that about 3% of all employed people are alcoholic. The ratio of men to women alcoholics is about four to one, but some authorities have claimed that the ratio would be closer to two to one or one to one, if all the women alcoholics could be counted. They are not counted because they don't get into public places or hospitals, where the cases are reported.

In this presentation an attempt will be made to indicate some of the relations between the physician and the alcoholic patient as viewed by a psychiatrist with special interest in alcoholism. It is not intended that this be a comprehensive review or survey, nor is it a report of original research. The scope of the topic will be more or

Presented at the 78th Annual Meeting of the American Association of Railway Surgeons, Chicago, Ill. Reprinted from *Industrial Medicine and Surgery*, Oct 1966, with the permission of the editor and the author.

less limited to some aspects of the author's experience and some recent trends and developments which may prove stimulating and helpful in dealings with alcoholism, either in the railroad industry or in the medical field.

Nature of Alcoholism

There are different conceptions concerning the nature of alcoholism and its etiology. In the author's opinion the most useful view is the understanding of alcoholism as primarily a disorder of behavior, an emotional illness or a mental illness. This condition is recognized as mental illness by its inclusion in the "Diagnostic and Statistical Manual of Mental Disorders," published by the American Psychiatric Association.

In considering the nature of alcoholism, we must account for (1) the onset of alcoholism after puberty or early adolescence; (2) the fact that drinking is a rather complex voluntary act which is carried to an extreme by repetition; (3) the obvious finding that there is no single type of alcoholic personality, and that there is a great individual variation in the personality make-up among people who drink excessively; (4) the observation that in addition to the symptom of excessive, urgent drinking, these people nearly always have more or less severe difficulties in getting along with their families or others, show some other symptoms of emotional disorder, such as depression, severe anxiety, feelings of inferiority, phobias, or some recognizable psychosomatic condition, including peptic ulcer, hypertension, functional bowel distress, and so forth; and (5) the experience reported over and over again by alcoholics that abstaining from drinking does not, in itself, provide the alcoholic with personal adjustment, serenity, or satisfaction from living.

This is an incomplete list of the clinical features which must be accounted for by our understanding of alcoholism, but it is enough to remind us that we are discussing a complex condition, one which is not really encompassed by aiming at sobriety or abstention on the part of each alcoholic. In other words, there is much more to alcoholism than the drinking itself.

For purposes of this essay, alcoholism is conceived of as a condition in which the drinking is the symptom of an underlying emotional disorder, which is the primary difficulty and which precedes the actual appearance of excessive drinking. It is also assumed that if an alcoholic patient had been seen clinically by a psychiatrist before he became a compulsive drinker, he would have been found to have a clinically recognizable emotional disorder which, at that time, could have been defined as a psychoneurosis or, less often, a psychosis.

The emotional disorder varies from case to case and may be related to different stages of emotional development. The alcoholism represents the way in which the particular subject reaches out in an effort to cope with anxieties, depressions, feelings of inferiority, or other painful affects.

Now, what about a biological factor in the causation of alcoholism? There may be such a biological factor in what leads to this condition, but, at the present time, the evidence for this is inconclusive, and this conception does not help in dealing with the problem and treatment. Whether or not there is an organic explanation for some aspects of alcoholism, there is a great need to understand the psychology of the alcoholic, in a valid attempt to treat him.

Treatment of the Alcoholic

The treatment of the alcoholic represents certain problems to any professional, be he a general practitioner, an internist, a psychiatrist, or a member of an agency staffed by social workers and psychologists. In the first place, more often than not, the alcoholic does not present himself for treatment, but, rather, contact on behalf of the alcoholic is made with the physician through an intermediary, the wife or other relative of an alcoholic, a minister, employer, attorney, or a judge. In a certain number of cases, the alcoholic will call the doctor himself. His call may be associated with the realization that he is in trouble regarding the drinking because of the onset of some complication of drinking or due to his responding to pressure from some outside person.

When the doctor meets the alcoholic patient, he often finds that the alcoholic is not interested in any treatment or that he avoids acknowledging that he drinks pathologically by denying it, by minimizing it, or by simply explaining it away.

The alcoholism tends to be exasperatingly recurrent. The physician often runs the gamut of his ingenuity and armamentarium, and still the drinking recurs.

In the course of his dealings with the doctor,

the alcoholic often demands much time because of drinking episodes and their complications, which lead to many visits or telephone calls by the patient and by the patient's relatives. In addition to this requirement of excessive time, the patient often proves to be financially unreliable. Understandably, this leads the doctor to hesitate to treat many of these people.

Many physicians probably deal effectively with the alcoholic and succeed in ushering him into examination and treatment. They then help him to drink less or to abstain. For those who do not deal successfully with the alcoholic and would like to, a few suggestions are made: The initial contact with the patient is very important. It may be that the first meeting will be by telephone and not in person. The doctor's relationship with his alcoholic patient begins at the moment of his earliest verbal exchange with the patient or, for that matter, with the patient's relatives. Even the receptionist may be a factor in whether the alcoholic accepts the notion of being treated or feels that he has met with one more rebuff.

In preparation for this initial contact the attitude and orientation of the physician count a great deal. One cannot be helpful to the alcoholic patient unless he can accept him without moral overtones and with medical objectivity and interest. This is not a simple hurdle to surmount. It may turn out that some of us cannot free ourselves from bias. The alcoholic is very sensitive to rejection in any form and yet does not always respond to the sincere interest and intent on the part of the doctor. It is almost as if the alcoholic wants to reserve the right to reject the helper, but he wants the physician to be always understanding and infinitely patient with him.

This is not an easy slot to fill. However, it is a prerequisite for the helping person, the doctor, to approximate a disposition of continued acceptance, unending patience, and therapeutic interest if the treatment is to be effective.

At the start of the relationship it is vital to let the patient know that you are his ally and not merely a tool through which the family expects to manipulate the patient. This alliance must not be interpreted to mean that the doctor needs to be hamstrung by his own promise, implied or expressed, in acting in the best interests of the patient. On the other hand, it is well to avoid any move that would give the patient the impression that he is being taken advantage of. This means, of course, if some crisis comes up and the doctor has to take some kind of action without, possibly, consulting the patient.

In the course of the treatment relationship there may be more than one occasion when the doctor makes delicate decisions during some crisis, which may jeopardize the future treatment. Usually the doctor can find a way of preserving the relationship with the patient even though he has had to act forcibly towards him and effect a temporary alliance with a relative or community agency.

Here, too, the doctor must try always to act in the best interest of the patient, even though the latter may not agree at the time with the step to be taken. Later, one can approach the patient with the notion that if he had not put himself into such a helpless position, the physician would not have had to act in a seemingly high-handed way on his behalf.

Psycho-pathology of Alcoholism

In regard to alcoholism, as with any other disease, it is well to keep in mind the pathology, and in this case the psycho-pathology, in deciding what treatment to use. The most salient features of the psycho-pathology include the following:

a. The drinking is a symptom which represents the way in which the patient is trying, albeit ineffectively, to handle some painful feeling. Incidentally, the patient may not be aware that his drinking serves this purpose.

b. Before the drinking became excessive, the patient had severe emotional problems which were neurotic or, less often, even psychotic in nature, and which produced the painful affect and other aspects of his irrational behavior.

c. Concurrent with the uncontrolled drinking, the patient developed certain personality modifications to enable him to cling to drinking despite his own common sense and the influence of others around him. These modifications or mechanisms include denial, rationalization, projection, pathological lying, deception, and other psychological devices to enable holding on to the drinking.

d. The condition of alcoholism is recurrent and chronic. It is well to note this: in planning on the part of one of the committees of the American Psychiatric Association, it, in effect, planned for lifelong care for the alcoholic. This may seem to be a little pessimistic, but it shows that we are

beginning to accept the idea that we are not dealing with an always-curable illness, at least not at this particular date.

Treatment

Once the patient has accepted the idea of treatment, the doctor has various means at his disposal for dealing with these patients. This amounts to four main categories. One is emotional support; another is medical management; the third is referral; and the fourth is collaborative management. These means of helping the alcoholic need not exist in pure culture and may be combined in any way that experience, intuition, and common sense dictate.

These four main features, (a) through (d), will serve as a useful guide in dealing with alcoholism, although this is only a minimal diagram of an alcoholic patient, and other characteristics could have been selected.

The first category mentioned, of help, is emotional support. Emotional support for the alcoholic patient means that the physician communicates something to the patient which assists the patient in feeling more comfortable in facing external tasks and in dealing with feelings and urges, including the impulse to drink. But this does not mean coddling the patient, making his decisions for him, or trying to make up to the patient for the deprivations of his childhood. It does require an interest on the part of the doctor which is tempered by the acceptance of the nature of the alcoholic's problems and his emotional make-up. The attitude of the helping person must be as free as possible from contempt, preconceived judgments, and, certainly, condemnation. Sometimes support means saying things to the patient which enable him to exercise his own judgment more effectively or to accept responsibility more readily. In some instances, merely listening to the patient, showing concern, along with reasonable encouragement, enables significant clinical improvement.

The capacity to render effective support to an alcoholic patient does not necessarily require detailed knowledge about the psychology of alcoholism, but some accurate information about it may go a long way to enable each physician to make the best use of what time he has to treat this type of patient.

The medical support would involve treating the emotional symptoms and medical symptoms. Here the substitution of some other drug for alcohol is one method. The danger, of course, is to exchange one addiction for another. This is very real. In order to avoid this, try to give this type of medication only to patients you are actively following and seeing fairly regularly, and try, even at some inconvenience, to use non-refillable prescriptions so that the patient and physician both are reminded of how much and how frequently he is using his medication.

Insomnia and Depression

Under medical support one would be dealing with insomnia and depression. Here, too, the caution about giving prescriptions and not paying attention to how much and how frequently they are being refilled is very important. Needless to say, there are a number of suicides and accidental deaths among alcoholics, and when one deals with both the outpatient clinic level and the state hospital level, one sees how frequently this happens.

The drinking itself can be dealt with sometimes using antabuse which sensitizes the patient to taking alcohol, so that he must wait 24 to 48 hours before he takes a drink and after he stops taking medication. The author prefers to use antabuse in conjunction with other therapeutic technique.

Sometimes a physician with some interest in the subject can maintain a patient on antabuse, see him fairly regularly for brief periods of time, and do very well in controlling the drinking.

The Referral Method

Referral is definitely a method of dealing with the alcoholic, and here is an opportunity for a physician to reevaluate what he is doing in the community and in his own practice with alcoholism. The problem of alcoholism will never be solved by the medical profession alone; that is, physicians including psychiatrists. Each of us should do what he can in his own private practice to not simply disregard the alcoholic but to try to help him, try to develop some talent for dealing with him.

The problem of alcoholism goes well beyond the medical profession, and we need to tap municipal, state and federal sources in order to encompass the problem.

In each state, or states, there are alcoholism

agencies which might be of great help, and to which patients can be referred.

Referral doesn't mean that the doctor necessarily loses a patient. The state agency would rather have a patient who has been in a state hospital or a patient who has come to the clinic go back to his family doctor for his medication or for any other medical care that he needs.

Patients can also be referred to appropriate sanitaria. More and more psychiatric wards of general hospitals are taking alcoholic patients.

Alcoholics Anonymous

There is no question about the importance of Alcoholics Anonymous. It has proved its worth to many alcoholics. On the other hand, Alcoholics Anonymous is not a professional organization in the ordinary sense. It has a definite ceiling on how much it can modify its techniques and grow. On the other hand, professional scientific methods are theoretically without any such limit, and certainly need to be fostered and developed.

Alcoholics Anonymous is used in state work with alcoholic patients, as well as in private practice. It is deplorable that the medical profession tends to dump the problem of alcoholism on Alcoholics Anonymous. This is objectionable because we have a responsibility that is different from theirs. They can do some things that we cannot do; on the other hand, in the long run, we can do some things that they cannot do.

There are many alcoholics who will not have anything to do with Alcoholics Anonymous. This is not a criticism of the patient nor of the organization, but it simply indicates that no one method is best for all alcoholics, and there is plenty of room for new methods and new ideas in dealing with this illness.

Social Workers and Psychologists

With respect to the idea of collaborative management, if a psychologist or a social worker in your community would be available to work psychologically with some of the alcoholics, individually or in groups, it might be a great help in dealing with increasing numbers if the physician and the social worker and the psychologist were willing to work together.

In Illinois, social workers and psychologists are probably dealing with as many, if not more, alcoholic patients who are in the state program than physicians are directly.

The people who are actually seeing and interviewing the alcoholic patients in the Illinois programs are primarily non-medical. This is not a temporary situation. It is not going to disappear in the next five or ten years. If anything, more and more clinical responsibility will be discharged by the social workers and psychologists.

The author proposes that we learn to work with them, to not discourage them, but to find out what they can do and how they can help us in these huge mental health problems.

How long will
it take her
to recover from
her hip fracture
if she just
doesn't care?

Does she really care? Is she alert, encouraged, positive and optimistic about getting completely well soon?

Or has she given in to the demoralizing impact of confinement, disability and dependency?

When functional fatigue complicates convalescence, Alertonic can help...

Pleasant-tasting Alertonic is pipradrol hydrochloride—an effective cerebral stimulant whose gentle analeptic action helps counteract the apathy and inertia that can often delay convalescence—together with an excellent vitamin and mineral formula, in a satisfying 15% alcohol vehicle.

Nothing fosters confidence and a sense of well-being better than your own personal warmth, understanding and encouragement together with Alertonic to help insure prompt response.

Adequate dosage is important: Prescribe Alertonic—one tablespoonful t.i.d., 30 minutes before meals...tastes best chilled.

And for your patient's sake, prescribe Alertonic in the convenient, economical one-pint bottle.

Alertonic®

Available Only On Prescription

Each 45 cc. (3 tablespoonfuls) contains: alcohol, 15%; pipradrol hydrochloride, 2 mg.; thiamine hydrochloride (vitamin B_1) (10 MDR*), 10 mg.; riboflavin (vitamin B_2) (4 MDR), 5 mg.; pyridoxine hydrochloride (vitamin B_6), 1 mg.; niacinamide (5 MDR), 50 mg.; choline,† 100 mg.; inositol,† 100 mg.; calcium glycerophosphate, 100 mg. (supplies 2% MDR for calcium and for phosphorus) and 1 mg. each of the following: cobalt (as chloride), manganese (as sulfate), magnesium (as acetate), zinc (as acetate), and molybdenum (as ammonium molybdate).

*Multiple of adult Minimum Daily Requirement supplied.
†The need for these substances in human nutrition has not been established.

Indications: 1. Functional fatigue such as that often associated with: a depressing life experience or stressful time of life; advancing years; convalescence; limited activity or confinement. 2. Poor appetite and vitamin-mineral deficiency as they occur in: patients having faulty eating habits; geriatric patients who are losing interest in food; patients convalescing from debilitating illness or surgery.

Dosage: Adults, 1 tablespoonful; children (over 15 years old), 1 to 2 teaspoonfuls; children (4 to 15 years old), 1 teaspoonful. To be taken three times daily 30 minutes before meals.

Contraindications: As with other drugs with CNS stimulating action, Alertonic is contraindicated in hyperactive, agitated or severely anxious patients and in chorea or obsessive compulsive states.

Side effects: Reports of overstimulation have been rare. Patients who are known to be unduly sensitive to the effects of stimulant drugs should be observed carefully in the initial stages of treatment.

when he just can't sleep

Tuinal

One-Half Sodium Amobarbital and
One-Half Sodium Secobarbital
supplied in ¾, 1½, and 3-grain Pulvules

'uinal helps wakeful patients fall asleep fast, stay sleep all night.

ndications: Tuinal, comprised of equal parts of Seconal® odium (sodium secobarbital, Lilly) and Amytal® Sodium odium amobarbital, Lilly), is indicated for prompt and oderately long-acting hypnosis. Not suitable for con- nuous daytime sedation.

Contraindications: Barbiturates should not be adminis- ered to anyone with a history of porphyria, nor should hey be given in the presence of uncontrolled pain, be- ause excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Dosage: 1½ to 3 grains at bedtime.

Additional information available to physicians upon request.

Perhaps there have been times when you wanted to prescribe erythromycin and triple sulfas for little patients. Now you can—with a choice of two new fine-tasting pediatric forms.

New–Two Pediatric Forms of Erythromycin and Triple Sulfas

ERYTHROCIN®-SULFAS Chewable (Erythromycin ethyl succinate-trisulfapyrimidines chewable tablet)

In clinical trials[1,2], this orange-flavored tablet was given to 55 patients, aged four months to 18 years.

Diagnoses (multiple in some cases) represented a cross section of bacterial infections commonly seen in pediatric office practice.

Therapy was given from three to 12 days, with an average of six days.

Of the 55 patients, 30 were reported cured within 72 hours, while 22 showed partial recovery within the same time, and subsequent clinical cure.

A clinical cure rate of 94.5%

ERYTHROCIN®-SULFAS Granules (Erythromycin ethyl succinate-trisulfapyrimidines granules for oral suspension)

87 patients were treated[1,2]—all children, ages four months to 15 years.

The diagnoses were multiple in some cases and were chiefly bacterial infections of the respiratory tract.

Dosage was maintained from three to 10 days; average treatment was five days. All of the ill children accepted the orange-flavored suspension favorably.

53 were clinically cured within 72 hours, while 32 showed partial relief within the same time, and subsequent clinical cure.

701358

A clinical cure rate of 97.7%

Brief Summary on next page

ERYTHROCIN®-SULFAS
Brief Summary

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or newborn infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions, Side Effects: Occasionally mild abdominal discomfort, nausea or vomiting may occur with erythromycin, generally controlled by reduction of dosage. Mild allergic reactions (such as urticaria and other skin rashes) may occur. Serious allergic reactions have been extremely infrequent. Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated. If overgrowth of nonsusceptible organisms occurs, withdraw the drug and institute appropriate treatment. If a patient should show signs of hypersensitivity, appropriate countermeasures (e.g. epinephrine, steriods, etc.) should be administered and the drug withdrawn.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. of each of sulfadiazine, sulfamerazine and sulfamethazine.

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide	195 mg.
Aminophylline	130 mg.
Phenobarbital, Caution: May be habit forming...	21 mg.
Ephedrine HCl	16 mg.

FEDERAL LAW PROHIBITS
DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

Elijah Saunders, MD—*Editor*

Rheumatic Fever: A Changing Approach to Secondary Prevention

LEON GORDIS, MD, MPH
Chairman, Rheumatic Fever Committee
Maryland Heart Association

Although the specific mechanisms involved in the pathogenesis of rheumatic fever are still unknown, the demonstration that all attacks of rheumatic fever occur as sequelae to antecedent streptococcal infections has provided the basis for an intelligent approach to both primary and secondary prevention. When first sulfa and then penicillin were added to our therapeutic armamentarium, it seemed likely that rheumatic fever recurrences would soon become a thing of the past. Today, however, over twenty years later, recurrences of rheumatic fever are unfortunately very much with us and at a large pediatric hospital in Baltimore, for example, recurrent attacks still comprise 11% of the total admissions for rheumatic fever.

Such recurrences are of great concern for several reasons. In the first place, an attack often carries with it a hospitalization with its attendant emotional trauma, educational deprivation and financial cost for the patient, his family and community. However, recurrences of rheumatic fever are also important from another viewpoint: Acute rheumatic fever is a far milder disease today than it was 20 years ago, and first attacks are rarely followed by severe rheumatic heart disease. *Most cases of incapacitating rheumatic heart disease today result from recurrent attacks of rheumatic fever.* Since rheumatic heart disease is the only permanent physical disability resulting from rheumatic fever, recurrences are a prime concern in any program aimed at prevention and control of this disease.

Role of the Maryland Heart Association

For over ten years, the Maryland Heart Association has provided penicillin to rheumatic patients for continuous prophylaxis against recurrent attacks. This program was initiated as a project to demonstrate the effectiveness of such a regimen in reducing the frequency of recurrences in rheumatic patients. The value of prophylaxis is now widely accepted. It has become increasingly clear, however, that the mere provision of the drug is not sufficient to engender patient cooperation. Indeed, prevention of recurrent attacks of rheumatic fever shares a number of the problems inherent in the management of many chronic diseases. The difficulties are often even greater in rheumatic fever since the patient is frequently asymptomatic after his acute attack and cannot accept the fact that he is at high risk for a recurrence unless he adheres to a preventive regimen. Several studies have shown that a large percentage of patients who begin on prophylaxis stop taking their drug within a short period of time.[1, 2] It is therefore apparent that the provision of medication must be coupled with an effective program of follow-up of delinquent patients.

With these considerations in mind, the Mary-

land Heart Association has undertaken a revision of its secondary prevention program. The changes to be described were initiated over a year ago and at the present time are still being developed and put into action. Briefly, these changes are as follows: The Heart Association no longer buys penicillin. Instead, the Association and the Maryland Pharmaceutical Association have agreed on a plan under which member pharmacists sell penicillin at low cost to patients certified as rheumatic by the Heart Association.

A second change has been the conversion of the Heart Association Registry to electronic data processing. Each month the Registry punch-cards are sorted for patients due back for penicillin. When a patient goes to a pharmacy to have a new prescription filled, the pharmacist sends in a card reporting the fact. These cards are subsequently matched with those of the patients who are due back during a given month. We are thus able to obtain a "print-out" of delinquent patients each month. We are now in the process of arranging for print-outs of delinquent patients by clinic in the hope that if each clinic is so notified, it can take action to restore these patients to medical supervision. We are also exploring the feasibility of utilizing a monthly list of delinquents in Baltimore City by health district and, in the rest of the State of Maryland, by county. If such a list included the school attended by delinquent rheumatic children, it would enable public health nurses in the districts and in the schools to follow up on all delinquent patients. Revisions of this type are being made to enable the registry to serve as an aid to regular community agencies in the follow-up of patients who have stopped their prophylaxis.

The Heart Association has also been examining its own role in the actual follow-up of rheumatic patients. The possibility of having a staff member coordinate follow-up activities on a community-wide basis is being carefully considered.

Verification of New Cases

In 1965, a procedure was instituted by which all new cases referred to the Heart Association Registry are verified by a Heart Association physician who reviews the clinical features reported on the referral form. Physicians are now also being encouraged to register as rheumatic suspects all patients in whom the diagnosis of rheumatic fever is in doubt. These physicians will be notified six months to a year after the referral has been made that they had referred a suspect case to the Registry and that perhaps re-evaluation and final disposition are in order.

This process of verification is important not only from the standpoint of patient welfare, but also from that of the clinical data being gathered. The statistics from the Registry do not give the incidence of the disease in our community since, on the one hand, a significant number of cases are not reported to the Registry and, on the other, some cases may have been over-diagnosed. Nevertheless, the data provided by the Registry do give us minimum-incidence figures for the community and also provide a changing clinical profile of rheumatic fever from year to year. Although it is too early to report on the clinical data for the first year of the revised Registry operation, it is interesting to note that 521 new referrals were made to the Rheumatic Fever Registry during 1966. Of these, 165 were for definite new attacks, and 7 for suspect new attacks. These figures represent minimum incidence, and indicate the problem of rheumatic fever is very much with us.

Other Problems

The changes in the Registry operation that have been briefly described here are intended to improve the follow-up of patients who have had rheumatic fever. The effectiveness of these modifications, however, will be governed in large measure by other factors which pose major limitations to secondary prevention programs. We have referred to the fact that several studies have reported that most rheumatic patients discontinue prophylaxis within a few years after their attack An equal cause for concern is the fact that, even among patients who remain on prophylaxis programs, there is a significant lack of compliance with medical recommendations.[3, 4, 5] Several factors may play a role in this non-compliance. In the first place, most patients with rheumatic fever are asymptomatic. Secondly, rheumatic fever, which has been called a social disease, occurs most frequently in lower socioeconomic groups. Families in these groups are often faced with complex psycho-social problems and may indeed be more concerned with their subsistence from week to week or even day to day than they are with taking oral penicillin, the reasons for which

When the problem is only skin deep

USE 'POLYSPORIN'® brand POLYMYXIN B-BACITRACIN OINTMENT

for topical antibiotic therapy with minimum risk of sensitization

Caution: As with other antibiotic products, prolonged use may result in overgrowth of nonsusceptible organisms, including fungi. Appropriate measures should be taken if this occurs.

Supplied in ½ oz. and 1 oz. tubes.

BURROUGHS WELLCOME & CO. (U.S.A.) INC.
Tuckahoe, N.Y.

they cannot completely comprehend. Traditional specialty clinic care is often not equal to the problem of maintaining chronically ill patients on long term therapy. Indeed, categorical programs that concentrate on one disease to the exclusion of all others are inconsistent with modern medical aims at treatment of the whole patient.

Since rheumatic fever generally occurs during childhood or adolescence, it often has profound effects on the delicate processes of physical and emotional growth and development. The care of the rheumatic child in our clinics must therefore be integrated into the total pediatric or adolescent care he requires. Parents are more likely to follow through on recommendations for continual prophylaxis when they recognize that for any of their child's problems they can turn to the same physician who has a deep interest in their child's total physical, emotional and social adjustment. The individual attention sensed by both parent and child may foster greater compliance with medical recommendations and may indeed result in more successful prevention programs.

The changes made in the Maryland Heart Association Rheumatic Fever Registry represent only first steps, designed to improve the follow-up of rheumatic patients. These steps, however, must be followed by increased knowledge and understanding of our patients, of their needs, and of their aspirations, so that the medical care they receive can be made more consistent with their needs. The periodic evaluation of the rheumatic patient must be made in the context of total patient care. By coupling this approach with increased efforts in health education, we will begin to bridge the gaps in our present secondary prevention program.

NUMA® DURA-TABS®

for *prolonged* aid to ventilation

Each Numa Dura-Tab provides:

theophylline	225 mg.
ephedrine HCl	50 mg.
butabarbital	25 mg.

(Warning: butabarbital may be habit-forming.)

Numa Dura-Tabs provide *prolonged* three-way action to ease breathing. Theophylline, a potent bronchodilator with minimal effect on the CNS, opens air passages and reduces bronchial spasm. Ephedrine HCl improves breathing capacity through its decongestant action. Butabarbital, a mild sedative, allays fear and apprehension.

Dosage: One Numa Dura-Tab every 8 to 12 hours helps keep the asthmatic patient symptom-free all day/all night.

Precautions: Use with caution in cardiovascular or hyperthyroid disease, severe hypertension, circulatory collapse, prostatic hypertrophy, or glaucoma.

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, Commissioner

HIGHLIGHTS

Statewide Measles Immunization Campaign

In a joint effort to eradicate measles in Maryland, the Medical and Chirurgical Faculty and the State Health Department will sponsor, in May, a mass campaign throughout the State to vaccinate children aged one through nine against this disease. It is estimated that some 150,000 children in this age group are susceptible to measles.

The Medical and Chirurgical Faculty is contributing the funds for educational and publicity materials, participating in the statewide organization of the campaign, and encouraging component societies to foster their own local campaigns and to man the clinics with necessary physicians. The State Health Department is assisting in organization and technical direction.

Local health departments, in cooperation with county medical societies and the Baltimore City Medical Society, are responsible for local organization in each campaign and for conducting the clinics. St. Mary's County will not participate in the May campaign because a mass immunization program was conducted there earlier in the year: despite bad weather and poor road conditions, approximately 1,300 children in the county received measles vaccine on February 12.

The US Public Health Service will provide vaccin for pre-school children in the May program. Costs for vaccine to be administered to older children will be defrayed by voluntary contributions of one dollar per child from the parents of all children who are vaccinated. Inability to pay will not preclude the vaccination of any child, however.

Members of the Junior Chamber of Commerce have volunteered to help in the campaign wherever they may be needed.

The Wennberg Report

The Department-sponsored sampling survey of 338 welfare-certified patients in 19 Baltimore nursing homes that have 50% or more of their beds occupied by welfare-certified patients was the work of John Wennberg, MD, graduate student in the School of Hygiene and Public Health, The Johns Hopkins University.

Findings of the study documented what has been obvious for many years—that too many elderly persons must live their remaining lives under conditions less than tolerable.

It is fruitless for specialized groups—whether physicians, hospitals, nursing home operators, or public health personnel—to point accusing fingers at one another. The problem is complex and requires total effort on all sides to combat it.

The situation derives to a large extent from social changes: increased longevity, increased percentage of the aging population, less spacious living accommodations, scarcity of household help, rising costs of living, difficulties of caring for the often incontinent and confused aging person, educational needs of youth, and last—but by no means least—the increasing burden on the physician who now is seldom in a position to serve as the "family doctor" of yesteryear.

Money will help, but is only a partial answer.

Solution to the problem lies in increasing general awareness and concern for the aged ill, so that they may receive not only proper medical care, but attention to their personal comforts and lonely state as well.

A copy of the Wennberg report is available, upon written request to the Department, to anyone wishing to acquaint himself with its findings.

Private Clinical Laboratory Directors

The registration of clinical laboratories in Maryland, now required by law, shows that of 65 private clinical laboratories outside of hospitals, 24 are headed by 15 Board-certified pathologists, 17 by 15 physicians other than pathologists, and 24 by 9 nonmedical doctors. Approximately 50% of the total number of tests were performed in laboratories directed by pathologists.

Billing for Aged Medical Assistance Patients

Physicians treating patients 65 years of age and over, who are certified under the Maryland Medical Assistance Program, may now use a single billing form to list all charges. The bill is sent to Blue Shield, which separates the Federal from the State portion and notifies the respective agencies of the amount owed by each.

This simplified procedure is the result of a coordinated effort by the Department, Blue Shield, and the Social Security Administration to ease the paperwork of the physician. It will also facilitate keeping the record of payments to physicians for services to elderly patients under the Medical Assistance Program, so that these payments are properly credited against Medicare's $50 deductible and 20% co-payment features.

The only exceptions to this procedure would be in the rare cases in which services are not included in the Medicare program, but are covered by the Medical Assistance Program.

Information on the revised billing method has been mailed to all Maryland physicians. Inquiries may be directed to Mr. John E. Welsh, Medical Services Division, 837-9000, Extension 8373.

New Vaccination Certificate

A new International Vaccination Certificate must be used for any person vaccinated after Jan. 1, 1967. The traveler may obtain the certificate from his travel agency or passport office, and should fill in the front page before presenting it to his physician.

After performing the vaccination, the physician must note the date of vaccination, the fact that a liquid or freeze-dried vaccine was used, the manufacturer's name, and the control or lot number, and he must sign the certificate. The traveler is responsible for having the certificate validated by the health department.

The certificate, which is in the form of a booklet, also provides space to record a brief health history of the traveler, including other immunizations, blood type and group, allergies, lens specifications, and other physician's notes that might be helpful if medical treatment is needed abroad.

Biochemistry Division Relocates

Pending construction of badly needed new laboratory facilities, the Biochemistry Division has moved to remodeled quarters at 22nd and Charles Streets. The relocation permits expansion of its functions to include screening tests and methodology development and training. The vacated quarters will be used for virologic examinations and will allow proper space for an electron microscope for rapid diagnosis of epidemic viral infections and other studies.

Communicable Disease Reports for 1966

Reports received during 1966 reflect the changing patterns in Maryland of all communicable diseases but **tuberculosis,** which remains at the fairly constant level of about 1,200 cases each year. Difficulties in locating undiscovered cases and securing patient cooperation in follow-up care are chiefly responsible for the continued high incidence of tuberculosis among the elderly and those in the lower socioeconomic groups.

Venereal disease continues to show an increase, although this may reflect improved reporting by physicians of the cases received for treatment. There were 575 cases of primary and secondary syphilis reported throughout the state, and 7,612 cases of gonorrhea. It is estimated that these figures represent less than a third of the actual incidence. There is little hope that venereal diseases will be brought under control until every case is reported promptly.

Reported **hepatitis** cases, 95% the infectious type, increased by 186 to a total of 833. Incidence of **measles,** quite prevalent during the first half of the year, when 85% of the cases were reported, fell off to almost zero by December. The intensified immunization campaigns to be conducted in May are expected to reduce the

prevalence of this disease.

Twelve fewer cases of **meningococcal infections,** including meningococcus meningitis, were reported, indicating that the peak of the high incidence of the past two years (68 cases in 1965) has passed. The number of **salmonellosis** cases reported is not considered meaningful since the disease is thought to be far more widespread than figures indicate. Studies of control methods are being conducted, particularly in the poultry industry and in plants engaged in the manufacturing of feed from animal offal.

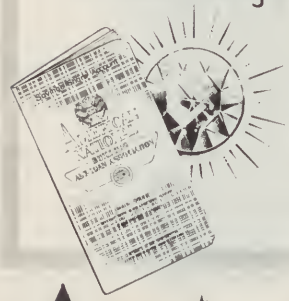
The Best of Plans for Successful & Safe Saving

New 1-Year Savings CERTIFICATES



. . . Superb Returns for Investment Accounts

SERIES "A" CERTIFICATES provide the highest anticipated Dividend allowable under Federal regulations, when held for the full term of 1 Year. Issued in minimum amounts of $12,000—or larger, with increments of $1,000. Ideal for investment of reserve funds.

SERIES "B" CERTIFICATES will yield an excellent supplemental anticipated Dividend, when held for the full term of 1 Year. Issued in amounts of $5,000—or larger, in increments of $1,000 up to a total of $11,000. These also are highly attractive investments.

Regular Passbook Savings Accounts

for Growth Saving with the Divi-GEM!

A great combination of advantages . . . a New High Dividend Rate, plus our famous G-E-M of a Plan! You Gain Every Month, and *keep what you gain*—because we calculate your Dividends on a MONTHLY BASIS. This gives you unusual flexibility in the use of your funds!

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak *your* language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

Tuberculosis Task Force Holds First Meeting

The Baltimore City Tuberculosis Task Force, a new group established to aid Baltimore City's fight against tuberculosis, held its first meeting on February 28. David Marine, MD, chief of medical services, Loch Raven VA Hospital, is chairman of the Task Force and Allan S. Moodie, MB, DPH, administrative health officer for tuberculosis control, Baltimore City Health Department, is secretary. Others who attended the first meeting included Edmund G. Beacham, MD, chief, Tuberculosis Division, Baltimore City Hospitals; Leon Hetherington, MD, chief, Division of Respiratory Diseases, Maryland State Department of Health; and Frank Jones, executive director, Maryland Tuberculosis Association. Also attending were the following staff members from the Loch Raven VA Hospital: Perry Austin, MD, chief, Outpatient Service; Young Chun, MD, Medical Service; and Martin Land, chief, Medical Administration Service.

The Baltimore City Health Department was represented by James E. Peterman, MD, MPH, director, Bureau of Communicable Diseases; C. Gottfried Baumann, MD, MPH, health officer, Western Health District; Meyer Jacobson, MD, clinical director; Moses Shiling, MD, director, Tuberculosis Surveys; Miss Alice Sundberg, director, Public Health Nursing; and the Rev. Harry E. Shelley, LLB, coordinator of Alcoholism Programs. James M. McDiarmid of the US Public Health Service attended the first organization meeting as an observer. William Newcomer, MD, superintendent, Mt. Wilson State Hospital, and Wilson M. Wing, MD, MPH, administrative health officer, Eastern Health District, were unable to attend.

The Baltimore City Tuberculosis Task Force will meet regularly to discuss problems dealing with diagnosis of disease, treatment in hospitals and clinics, and supervision of patients residing in the city. The group will also serve as an advisory body to the City Health Department's Bureau of Communicable Diseases and give direction for a more uniform coordinated attack against this disease that affects the lives of about 4,000 city residents and their families and is estimated to cost the taxpayer in excess of $2,500,000 yearly.

Addison W. Pope, MD, Joins Department

Addison W. Pope, MD, has joined the Baltimore City Health Department as associate director of Mental Hygiene Services, an appointment made possible by Isadore Tuerk, MD, commissioner of the State Department of Mental Hygiene.

Dr. Pope has an extensive background of psychiatric practice in Baltimore. He served his internship at Provident Hospital and completed his psychiatric residency at the Psychiatric Institute of the University of Maryland. He is a clinical instructor in psychiatry at the University of

FIGHTING CANCER WITH FILMS...

...is not news. What's news is that we've embarked on the most ambitious film program *for professional medical audiences* ever launched against a single disease. A half-million dollar film project is underway—with technical advice from the nation's leading medical authorities.

Five of these films are available now—
CANCER IN CHILDREN, DIAGNOSIS AND MANAGEMENT OF CANCER OF THE COLON AND RECTUM, ORAL CANCER, NURSING MANAGEMENT OF THE PATIENT WITH CANCER, and THE DENTIST AND CANCER. The balance will be released in 1967-1968.

As pioneers in the usage of medical films, we know their value as teaching tools. Our Units across the country know, too. Films are a vital part of their professional educational programs. We hope you will contact *your* local ACS Unit about this outstanding new series.

A Building Block approach to treating hypertension

With these three therapeutic building blocks you can create a once-a-day regimen to fit almost any degree of hypertension. See the following pages for details . . .

Consider starting your hypertensives on this basic thiazide

Enduron eliminates sodium around the clock, yet is relatively sparing of potassium

Enduron is a true 24-hour single-dose thiazide. Its sodium excretion is not squeezed into an abrupt peak during the first several hours. It is well-sustained in a plateau-like effect — with little reduction in intensity during the first 12 hours, and decline thereafter only gradual.

Potassium loss, in contrast, reaches an early minor peak. Then it subsides rapidly. Moreover, doses larger than 5 mg. have little added effect on potassium. Thus doubling the dose from 5 to 10 mg. approximately doubles sodium excretion—yet increases potassium loss little or none.

Use Enduron once a day as an ideal starting therapy in mild hypertension. Use it, too, as a basic therapeutic building block with which other agents can be joined, for managing your more resistant hypertensives.

Once a day, every day

ENDURON®
METHYCLOTHIAZIDE

DAILY DOSAGE RANGE	Minimum	Usual	Intermediate	Maximum
	2.5 mg. tablet	5 mg. tablet	7.5 mg.	10 mg.

See Brief Summary on final page of advertisement.

To build added response, shift to Enduronyl

The deserpidine component compares favorably to reserpine, but with reduced side effects

The rauwolfia component of Enduronyl is deserpidine (Harmonyl®), a purified crystalline alkaloid. It is comparable to reserpine in its antihypertensive and tranquilizing activity. Yet it produces less tendency toward typical rauwolfia side effects such as drowsiness, lethargy, stuffy nose, depression, etc.

Patient acceptance has been excellent.

Enduronyl comes in two strengths: regular and Forte. Both provide 5 mg. of Enduron. The variation is where most needed: in the deserpidine. These scored tablets give a surprisingly flexible choice of doses (see below).

Use Enduronyl for your patients within the broad range of mild to moderate hypertension. Dosage is *once* a day: this means Enduronyl will generally cost patients less than equivalent drugs taken two or three times daily.

Once a day, every day

ENDURONYL®

METHYCLOTHIAZIDE 5 MG. WITH DESERPIDINE 0.25 MG.

ENDURONYL FORTE

METHYCLOTHIAZIDE 5 MG. WITH DESERPIDINE 0.5 MG.

	Minimum	Usual	Intermediate	Maximum
DAILY DOSAGE RANGE	2.5 mg. methyclothiazide 0.125 mg. deserpidine	5 mg. methyclothiazide 0.25 mg. deserpidine	7.5 mg. methyclothiazide 0.375 mg. deserpidine	10 mg. methyclothiazide 0.5 mg. deserpidine
DAILY DOSAGE RANGE	2.5 mg. methyclothiazide 0.25 mg. deserpidine	5 mg. methyclothiazide 0.5 mg. deserpidine	7.5 mg. methyclothiazide 0.75 mg. deserpidine	10 mg. methyclothiazide 1 mg. deserpidine

704075

Eutonyl affords a different kind of basic therapy for moderate to severe cases

ABBOTT

Effect tied to reduced peripheral vascular resistance; no central depressant action

Eutonyl is a unique nonhydrazine agent. It is reported to act by reducing peripheral vascular resistance, with little or no effect upon cardiac output.[1,2]

In clinical trials, significant reductions in mean blood pressure were seen in 84% of patients studied — including some unusually difficult cases. Eutonyl lowers diastolic in proportion to systolic, and in half of the cases studied, reductions in the sitting and recumbent positions were nearly as great as in the standing position.

Most important: There is no central depressant action. In fact, many patients reported an *increased* sense of well being.

Here, then, is a highly effective *basic treatment* for moderate to severe cases—and one that will not hamper your patient with lethargy or drowsiness while on treatment.

Once a day, every day

EUTONYL®
PARGYLINE HYDROCHLORIDE

DAILY DOSAGE RANGE	Minimum	Usual starting	Intermediate	Maximum
	10 mg. tablet	25 mg. tablet	50 mg. tablet or as needed	200 mg.

1. Brest, A. N., et al., Cardiac and Renal Hemodynamic Response to Pargyline, Ann. N. Y. Acad. Sci., 107-1016, 1963.
2. Winsor, T., Pargyline Hydrochloride, Hypertension, Urinary Tryptamine, and Vascular Reflexes, Geriatrics, 19:598, Aug., 1964.

See Brief Summary on final page of advertisement.

Eutron adds thiazide for enhanced therapy with milder side effects

ABBOTT

Only a 7/4 mm. span between standing and recumbent pressures—reduced chance of orthastatic hypotension

The combining of Eutonyl and Enduron in Eutron permits a significantly greater antihypertensive effect than with either agent used alone. This in turn may allow therapeutic success with lesser dosage—and correspondingly milder side effects.

Indeed, fully 94.5% of all patients studied during clinical trials continued on therapy uninterrupted by side effects.

Most striking was the drug's action in lowering blood pressure to *nearly equal levels in all body positions.* Total average spread between standing and recumbent readings (after treatment) was only 7/4 mm. Hg.

Thus, in your moderate to severe cases, Eutron affords a usually smooth course of therapy, with reduced likelihood of orthostatic effects. And, because of the thiazide component, Eutron may be used in the presence of congestive heart failure.

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 MG.
WITH METHYCLOTHIAZIDE 5 MG.

	Minimum	Usual starting	Intermediate	Maximum
DAILY DOSAGE RANGE	12.5 mg. pargyline hydrochloride and 2.5 mg. methyclothiazide	25 mg. pargyline hydrochloride and 5 mg. methyclothiazide	37.5 mg. pargyline hydrochloride and 7.5 mg. methyclothiazide	50 mg. pargyline hydrochloride and 10 mg. methyclothiazide

See Brief Summary on final page of advertisement.

TM—Trademark

704075

ENDURON®

METHYCLOTHIAZIDE

ENDURONYL®

Each tablet contains Methyclothiazide 5 mg.
with Deserpidine 0.25 mg. or 0.5 mg.

Indications: Enduron is used to control edema and mild hypertension. Also used with other drugs for hypertension. Enduronyl is used in mild to moderately severe hypertension.

Contraindications: Neither Enduron nor Enduronyl should be used in severe renal disease (except nephrosis) or shutdown; in severe hepatic disease or impending hepatic coma; in patients sensitive to thiazides. Enduronyl is contraindicated in severe mental depression, active peptic ulcer, and ulcerative colitis.

Warnings: Consider possible sensitivity reactions in patients with a history of allergy or asthma. Avoid use of enteric-coated potassium tablets, as these may induce serious or fatal small bowel lesions; if added potassium intake is desired, dietary supplementation is recommended. Coated potassium tablets should be reserved for cautious use when adequate dietary supplementation is impractical.

Precautions and Adverse Reactions: Use thiazides with caution in severe renal dysfunction. Caution is also necessary with impaired hepatic function or progressive liver disease. During intensive or prolonged thiazide therapy, watch chloride and potassium levels (especially the latter if patient is on digitalis). In surgical patients, thiazides may alter response to vasopressors and tubocurarine. Use thiazides with caution in pregnancy (bone marrow depression, thrombocytopenia, or altered carbohydrate metabolism are possible in certain newborn). Occasional thiazide side effects also include blood dyscrasias; elevations of BUN, serum uric acid, or blood sugar; electrolyte imbalance, g.i. disturbances, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, pancreatitis, and gout.

Use Enduronyl with caution in patients with a history of peptic ulcer, as rauwolfias may increase gastric secretion. Discontinue at the first sign of mental depression. Rauwolfias may increase hypotensive effects of surgery or anesthesia, and are best discontinued two weeks prior. They also lower the convulsive threshold in epilepsy. Other possible rauwolfia side effects include drowsiness, nasal stuffiness, nausea, weight gain, and diarrhea. Less frequent complications of deserpidine therapy are aggravation of peptic ulcer, epistaxis, and skin eruption. Alcohol, barbiturates or narcotics may potentiate action of deserpidine.

EUTONYL®

PARGYLINE HYDROCHLORIDE

EUTRON™

Each tablet contains Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications: For treatment of patients with moderate to severe hypertension, especially those with severe diastolic hypertension. Not recommended for use in patients with mild or labile hypertension amenable to therapy with sedatives and/or thiazide diuretics alone.

Contraindications: Pheochromocytoma, advanced renal disease, paranoid schizophrenia and hyperthyroidism. Until further experience is gained, not recommended for use in patients with malignant hypertension, children under 12, or pregnant patients.

Concomitant use of the following is contraindicated: other monoamine oxidase inhibitors; parenteral forms of reserpine or guanethidine; sympathomimetic drugs; foods high in tyramine such as cheese; imipramine and amitriptyline, or similar antidepressants; methyldopa. Interval of two weeks should separate therapy and use of these agents.

Warnings: Pargyline hydrochloride is a monoamine oxidase inhibitor. Warn patients against eating cheese, and using alcohol, proprietary drugs or other medication without the knowledge of the physician. When necessary to administer alcohol, narcotics (meperidine should be avoided), antihistamines, anesthetics, barbiturates, chloral hydrate and other hypnotics, sedatives, tranquilizers, or caffeine, these can be used cautiously at a dosage of ¼ to 1/5 the usual amount. Adjust dose of anesthetic agents to response of patient. Avoid parenteral administration where possible. Withdraw pargyline two weeks before elective surgery.

Warn patients about the possibility of postural hypotension. Those with angina or other evidence of coronary disease should not increase physical activity. Pargyline may lower blood sugar. Avoid use of enteric-coated potassium tablets, as these may induce serious or fatal small-bowel lesions; if added potassium intake is desired, dietary supplementation is recommended. Coated potassium tablets should be reserved for cautious use when adequate dietary supplementation is impractical.

Precautions: Measure blood pressure while patient is standing to determine antihypertensive effect. Use with caution in hyperactive or hyperexcitable persons. Such persons may show increased restlessness and agitation. Withdraw drug during acute febrile illness. Watch patients with impaired renal function for increasing drug effects or elevation of BUN and other evidence of progressive renal failure; withdraw drug if such alterations persist and progress. Use with caution in patients with liver dysfunction or progressive liver disease. As with all new drugs, complete blood counts, urinalyses, and liver function tests should be performed periodically. With prolonged therapy, examine patients for change in color perception, visual fields, and fundi.

During intensive or prolonged methyclothiazide therapy, watch chloride and potassium levels (especially latter if patient is on digitalis). Methyclothiazide also may reduce arterial response to pressor amines. Use thiazides with caution in pregnancy (bone marrow depression, thrombocytopenia, or altered carbohydrate metabolism are possible in certain newborns). Thiazide drugs may increase responsiveness to tubocurarine.

Side Effects: Pargyline may be associated with orthostatic hypotension. Mild constipation, slight edema, dry mouth, sweating, increased appetite, arthralgia, nausea and vomiting, headache, insomnia, difficulty in micturition, nightmares, impotence, delayed ejaculation, rash, and purpura have been encountered with pargyline. Hyperexcitability, increased neuromuscular activity (muscle twitching) and other extra-pyramidal symptoms have been reported. Drug fever is extremely rare. Congestive heart failure has been reported in a few patients with reduced cardiac reserve.

Thiazide side effects also include blood dyscrasias, elevation of BUN, serum uric acid, or blood sugar, electrolyte imbalance, g.i. disturbances, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, pancreatitis, and gout. Nocturia has been observed with the combination.

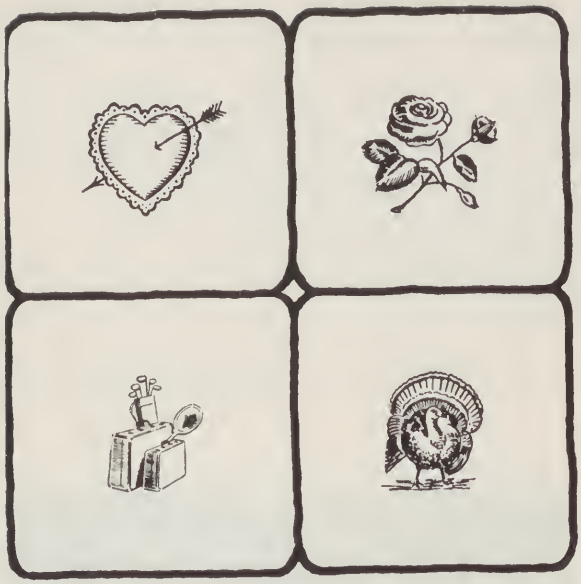
MARYLAND ASSOCIATION OF MEDICAL ASSISTANTS

APRIL, 1967 PEGGY BURY, *Editor*

ANATOMY AND PHYSIOLOGY COURSE OFFERED BY BAMA

Beginning in February and ending this month, Jack Zimmerman, MD, conducted an eight-session course in anatomy and physiology. Given in the Keswick Home auditorium, the course was offered to all who were interested in attending the weekly lectures, but was directed particularly to the medical assistants who are studying for the certification examination given by the American Association of Medical Assistants.

Dr. Zimmerman is chief of surgery and director of medical education at Church Home and Hospital and associate professor of surgery at The Johns Hopkins University School of Medicine. A graduate of The Hopkins medical school, where he served both his internship and his residency, he accepted an appointment at the University of Kansas School of Medicine in 1959 as associate professor of surgery. During his tenure there he was also chief of surgery at the Kansas City Veterans Administration Hospital. In 1965, he returned to Baltimore to accept his present position at Church Home and Hospital and The Johns Hopkins University School of Medicine.



Jack McK. Zimmerman, MD

J. B. T. FOSTER, MD, ADDRESSES BAMA

At the March meeting of the Baltimore Association of Medical Assistants, J. B. T. Foster, MD, pathologist, spoke to the membership on clinical laboratory work. Following his short presentation, the members participated in an informal discussion of laboratory techniques, interpretation of test results, and preparation of patients before tests.

A graduate of Princeton University, Dr. Foster received his MD degree from New York Medical College and served his internship at Bellevue Hospital. Following residencies at St. Luke's Hospital and Lenox Hill Hospital, he served in the US Navy at Jacksonville Naval Hospital. He then became associate pathologist at Doctor's Hospital, NY, and assistant medical examiner for New York City. After serving as Director of Labora-

tories and Pathologist at St. Joseph's Hospital, Yonkers, NY, Dr. Foster came to Baltimore to enter private practice as an associate of H. L. Wollenweber, MD.

"OUTSTANDING YOUNG WOMEN OF AMERICA" HONOR MEDICAL ASSISTANT

Gertrude Gillum, vice-president of the Maryland Association of Medical Assistants, was selected to appear in the 1966 edition of "Outstanding Young Women of America." Mrs. Gillum was one of four women from Allegany County chosen for this honor. She is presently employed as senior medical secretary at Memorial Hospital, Cumberland, Md., under Frank Cawley, MD; George Mock, MD; and Robert Miller, MD, radiologists.

Mrs. Gertrude Gillum

Guidelines for selection of candidates for recognition include unselfish service to others, charitable activities, community service, professional excellence, business advancement and professional responsibility. Following notification of her selection by the board of the General Federation of Women's Clubs, Mrs. Gillum also received a congratulatory letter from US Senator Joseph D. Tydings of Maryland.

State Auxiliary Members Invited to Attend June Convention of Woman's Auxiliary to the AMA

An invitation to attend the 44th Annual Convention of the Woman's Auxiliary to the American Medical Association on June 18-22 in Atlantic City, NJ, has been extended to all State Auxiliary members by Mrs. Asher Yaguda, of Newark, NJ, Auxiliary president. A block of rooms has been set aside at the Shelburne Hotel for Auxiliary members. Reservations should be made through the AMA Housing Bureau, 16 Central Pier, Atlantic City 08401. For preferential handling, reservations should be made early. A list of other hotels and motels appeared in the March issue of THE JOURNAL and will appear in spring issues of the *Journal of the American Medical Association* and the *AMA News*.

Mary Calderone, MD, noted proponent of sex education, is scheduled to talk on "Sex Education: Goals and Means" Tuesday morning, June 20. Also speaking on Tuesday will be Charles L. Hudson, MD, AMA president. He is to speak at the luncheon honoring Auxiliary past presidents and AMA officers and trustees. The Auxiliary's contribution to AMA-ERF will be presented at that time, as well as awards to county and state AMA-ERF winners.

Mrs. Yaguda and Mrs. Karl F. Ritter, Lima, Ohio, president-elect, will be honored at a reception Sunday, June 18. Mrs. Ritter will be installed as president Wednesday, June 21.

Other convention highlights will include the Monday Guest Day Luncheon (speaker to be announced) and "The Little Workshop," a question-and-answer session on Auxiliary programs. State auxiliary presidents will report on outstanding local programs at the Monday and Tuesday sessions.

The Auxiliary will also sponsor a teen-age program for children of physicians and guests attending the AMA convention.

HEALTH CAREERS CHAIRMAN REPORTS

The State organization of the Future Nurses of America held its annual meeting on April 22 in the Surrattsville Senior High School at Clinton, Md, according to a report from Mrs. Raymond M. Yow, Health Careers Chairman of the Woman's Auxiliary to the Faculty. The number of FNA clubs throughout the State has increased from 59 last year to 63 this year.

The Health Careers Committee of the Woman's Auxiliary to the Washington County Medical Society has visited every senior high school FNA club in the county; has entertained club officers and sponsors at a tea to which hospital representatives and nursing school directors were also invited; and has sponsored a Second Annual Health Careers Day, which encompassed visits to hospitals, addresses from professionals in various fields of health and the showing of a film entitled "Health Careers." The Washington County Auxiliary offered two scholarships this year, one of $600 for a student nurse and one of $65 for an X-ray technician student.

tee has informed Mrs. Yow that there are nine FNA clubs in Anne Arundel County senior high schools and that the county Chamber of Commerce sponsors a semi-annual Career Night which includes a section on Health Careers.

BALTIMORE CITY

The Annual Meeting and Installation Luncheon of the Woman's Auxiliary to the Baltimore City Medical Society will be held at noon on Wednesday, May 10, at 1211 Cathedral Street. Mrs. Max R. English will be installed as president of the Society and other officers for the coming year will be elected during the business session.

Guest speakers at the luncheon will be Dr. and Mrs. Theodore Woodward, who will give an illustrated talk entitled "A Medical Mission to Pakistan."

MONTGOMERY COUNTY

The Woman's Auxiliary to the Montgomery County Medical Society, in celebration of Doctor's Day (March 30) distributed red carnations in the county hospitals on that day and entertained the doctors of the county at a cocktail dance on April 2. The dance was held at the Manor Country Club.

AMA BYLAWS

Chapter VI. Meetings-Section 2. Registration (A) Members. A Member's Section registration shall correspond with his specialty or General Practice status as designated by him for classification in the American Medical Association Directory. To be accepted for Section registration purposes, a member of a Section who desires to change his registration from one Section to another because of a change in his specialty, shall be required to inform the Headquarters of The American Medical Association by written notice of this intention at least sixty days in advance of the Annual Convention.

Chapter VII. Sections-Section 7. Participation in Business Only *active members* registered in accordance with Chapter VI, Section 2 (A) shall have the right to participate in the *business deliberation* of a section.

American Medical Association · 116th Annual Convention · Convention Hall ·

June 18-22, 1967 Atlantic City

PLEASE NOTE

An Active physician member may not change *his Section* registration for voting purposes from one Section to another Section, unless written notice of a change in his specialty has been given the AMA Headquarters at least 60 days (by April 18, 1967) in advance of the opening day of the Annual Convention.

Upon completion of an Active Member's Registration at the AMA Registration Desk, members will not be permitted to switch from one Section registration to another Section registration during the entire period that the AMA Annual Convention is in session.

However, all members are encouraged to attend any and all of the Scientific Section programs. Such attendance has no direct connection with the Section in which an Active Member may wish to be qualified to vote.

Roche®

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Infants, patients with history of convulsive disorders or glaucoma.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly patients (not more than 1 mg, one or two times daily) to preclude ataxia or oversedation. Advise patients against possibly hazardous procedures until correct maintenance dosage is established; driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. Warn patients of possible combined effects with alcohol. Safe use in pregnancy not established. Observe usual precautions in impaired renal or hepatic function and in patients who may be suicidal; periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances, hallucinations); changes in EEG patterns. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage—Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed.

Supplied: Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 for convenience and economy in prescribing.

OFFICIAL PUBLICATION OF THE MEDICAL AND CHIRURGICAL FACULTY OF THE STATE OF MARYLAND

Whether the allergen is greenish or garish, unseen or unknown, your patient can get symptomatic relief with BENADRYL—the potent antihistamine with antispasmodic action. *INDICATIONS:* Antihistaminic, antispasmodic, antitussive, and antiemetic therapy. *PRECAUTIONS:* Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this product. Hypnotics, sedatives, or tranquilizers if used with diphenhydramine hydrochloride should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing diphenhydramine hydrochloride. *ADVERSE REACTIONS:* Side effects are generally mild and may affect the nervous, gastrointestinal, and cardiovascular systems. Drowsiness, dizziness, dryness of the mouth, nausea, nervousness, palpitation, blurring of vision, vertigo, headache, muscular aching, thickening of bronchial secretions, restlessness, and insomnia have been reported. Allergic reactions may occur.

BENADRYL is available in Kapseals® of 50 mg. and Capsules of 25 mg. 00667

The pink capsule with the white band is a trademark of Parke, Davis & Company.

prostatitis?

in any case,
usually gram-negative*

Therapy:

two 500 mg. Caplets® q.i.d
(initial adult dose)

NegGram

Brand of

nalidixic acid

a specific anti-gram-negative

eradicates most urinary tract infections...

- Low incidence of untoward effects; no fungal overgrowth, crystalluria, ototoxic or nephrotoxic effects have been observed.
- "Excellent" or "good" response reported *in more than 2 out of 3* patients with either chronic or acute gram-negative infections.[1]

*As many as 9 out of 10 urinary tract infections are now caused by gram-negative organisms: E. coli, Klebsiella, Aerobacter, Proteus, Paracolon or Pseudomonas[2]... However, infections of the urethra and prostate caused by non-gonococcal gram-negative organisms are believed to be less prevalent.

Indications: Urinary tract infections caused by gram-negative and some gram-positive organisms.

Side effects: Mainly mild, transient gastrointestinal disturbances; in occasional instances, drowsiness, fatigue, pruritus, rash, urticaria, mild eosinophilia, reversible subjective visual disturbances (overbrightness of lights, change in visual color perception, difficulty in focusing, decrease in visual acuity and double vision), and reversible photosensitivity reactions. Marked overdosage, coupled with certain predisposing factors, has produced brief convulsions in a few patients.

Precautions: As with all new drugs, blood and liver function tests are advisable during prolonged treatment. **Pending further experience, like most chemotherapeutic agents, this drug should not be given in the first trimester of pregnancy. It must be used cautiously in patients with liver disease or severe impairment of kidney function.** Because photosensitivity reactions have occurred in a small number of cases, patients should be cautioned to avoid unnecessary exposure to direct sunlight while receiving NegGram, and if a reaction occurs, therapy should be discontinued. The dosage recommended for adults and children should not arbitrarily be doubled unless under the careful supervision of a physician. Bacterial resistance may develop.

When testing the urine for glucose in patients receiving NegGram, Clinistix® Reagent Strips or Tes-Tape® should be used since other reagents give a false-positive reaction.

Dosage: Adults: Four Gm. daily by mouth (2 Caplets® of 500 mg. four times daily) for one to two weeks. Thereafter, if prolonged treatment is indicated, the dosage may be reduced to two Gm. daily. Children may be given approximately *25 mg. per pound* of body weight per day, administered in divided doses. The dosage recommended above for adults and children should not arbitrarily be doubled unless under the careful supervision of a physician. Until further experience is gained, infants under 1 month should not be treated with the drug.

How supplied: Buff-colored, scored Caplets® of **500 mg. for adults,** conveniently available in bottles of 56 (sufficient for one full week of therapy) and in bottles of 1000. **250 mg. for children,** available in bottles of 56 and 1000.

All About Aides: Part I 175
Wilburn L. McClure, Jr.

Staph—the most common cause of skin and soft-tissue infection

reliably controlled with specific therapy

suitable dosage form for every staph situation

ph—the most common cause of skin and soft-tissue ection—also is responsible for many more serious ections, such as pneumonia, osteomyelitis, and ticemia. Often, a seemingly minor skin infection is source of metastatic spread to deeper structures. en findings on culture incriminate staph as the se, Prostaphlin (sodium oxacillin) will provide ific effective therapy.

tericidal effectiveness. Hardly a staph organism resist the bactericidal action of Prostaphlin (sodioxacillin), as shown by a 34-month *in vitro* study. ll staph isolates tested, 99.5% were sensitive to cillin.[1]

Clinically proven. There is a high correlation between these *in vitro* findings and clinical results. Of 610 patients treated with Prostaphlin (sodium oxacillin), 89.8% were reported cured or improved, including those with staph infections resistant to penicillin G.[2] And since resistance does not appear to develop *in vivo,* therapy with oxacillin can be extended when necessary.

Outstanding safety record. Besides being staph-specific and rapidly absorbed—Prostaphlin (sodium oxacillin) has established an outstanding record of safety during five years of widespread clinical use. Continuous high blood levels of oxacillin have not produced toxic effects on kidney function, assuring a significant margin of safety. However, as with all penicillins, the possibility of allergic response should be considered.

Capsules, Oral Solution and Injectable. Prostaphlin (sodium oxacillin) is available in three flexible dosage forms to suit the age of the patient and severity of infection—capsules, an oral solution for pediatric use, and multi-dose vials for injection, I.M. or I.V.

PRESCRIBING INFORMATION: For complete information, consult Official Package Circular. *Indications:* Infections caused by Staphylococci, particularly those due to penicillin G-resistant Staphylococci. *Contraindications:* A history of severe allergic reactions to penicillin. *Precautions:* Typical penicillin-allergic reactions may occur. Safety for use in pregnancy and premature infants is not established. Because of limited experience, use cautiously and evaluate organ system function frequently in neonates. Mycotic or bacterial superinfections may occur. Assess renal, hematopoietic and hepatic function intermittently during long-term therapy. *Adverse Reactions:* Skin rashes, pruritus, urticaria, eosinophilia, nausea, vomiting, diarrhea, fever and occasional anaphylaxis. Rare cases of reversible hepatocellular dysfunction have occurred. Moderate SGOT elevations have been noted. Thrombophlebitis has occurred occasionally during intravenous therapy and leukopenia was noted in two cases. *Usual Oral Dosage:* Adults: 500 mg. *q.*4 or *q.*6*h.* Children: 50 mg./Kg./day. *Usual Parenteral Dosage:* Adults: 250-500 mg. *q.*4 or *q.*6*h.* Children: 50 mg./Kg./day. Treat beta-hemolytic streptococcal infections for at least 10 days. Give oral drug 1 to 2 hours before meals. *Supplied:* Capsules—250 and 500 mg. in bottles of 48. Injectable—250 mg., 500 mg., and 1 Gm. dry filled vial for I.M./I.V. use. For Oral Solution—100 ml. bottle, 250 mg./5 ml. when reconstituted. **A.H.F.S. CATEGORY: 8:12.6**

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

ON APRIL 6, THE EXECUTIVE COMMITTEE:

1. Authorized the provision of legal defense, if needed for 1967 acts, to two physicians who had reliable reasons for late payment of 1967 dues. No suits are pending against these physicians.

2. Made various recommendations to the Governor in connection with appointments to:
Board of Physical Therapy Examiners
Advisory Council on Hospital Construction
Advisory Board on Hospital Licensing
Commission on Problems of the Aging
Maryland Hospital Commission

3. Authorized expenditure of funds for past-president plaques.

4. Authorized the Subcommittee on Maternal Welfare to study changes in the Abortion law, and report back as promptly as possible, but before the 1968 General Assembly convenes.

5. Authorized the Treasurer to purchase insurance for the Faculty in connection with the Mass Measles Immunization campaign.

6. Authorized the use of the Faculty addressograph plates for a flyer on the Constitutional Convention.

7. Endorsed a proposal of the Maryland Heart Association to ask an opinion from the Attorney General's office on nurse initiation (as a first-aid measure) of closed-chest resuscitation.

8. Approved an appointment to the Baltimore Criminal Justice Commission.

9. Authorized the Treasurer to sign a contract with the State Health Department in connection with the Mass Measles Immunization program, after clearing with legal counsel and checking for the accuracy of the terms involved.

10. Adopted the following statement as recommended by legal counsel:

"It is the well-established and commonly accepted medical practice and custom in this State to do inoculations by hand syringe from multiple dose vials and such practice and custom is in accordance with traditional standards of medical care ordinarily practiced not only in this State but by others in the profession generally."

ON APRIL 19, THE COUNCIL:

1. Approved a recommendation to the House of Delegates for Emeritus membership.

2. Ratified legal defense for physicians requesting it.

3. Recommitted to the Med-Chi Insurance Trustees a proposal for a members' retirement program with the suggestion that commercial proposals be considered as well.

4. Adopted the following statement dealing with Chiropractic:

It is the position of the medical profession that chiropractic is an unscientific cult whose practitioners lack the necessary training and background to diagnose and treat human disease. Chiropractic constitutes a hazard to rational health care in the United States because of the substandard and unscientific education of its practitioners and their rigid adherence to an irrational, unscientific approach to disease causation.

In 1965, a United States District Court, in upholding a state's constitutional right to refuse to license chiropractors, said that "since chiropractic claims to be a complete and independent healing art capable of curing almost all kinds of disease, the state Legislature may have felt that the re-

THE FUTURE TAKING SHAPE!

Taylor Manor Hospital

ELLICOTT CITY, MARYLAND

HO 5-3322

Personnel and patients, alike, are watching the progress with eager anticipation.

A large Occupational Therapy Shop, Gymnasium-Auditorium, Gift Shop, Fountain Shop, Dining Area and Fireside Lounges, as well as a Swimming Pool Courtyard, will adjoin the 60 new rooms. This Center will augment the existing 100-bed psychiatric facility.

Edith L. Taylor, Executive Director

IRVING J. TAYLOR, M.D., MEDICAL DIRECTOR

quirement of a foundation in materia medica and surgery . . . would be a protection to the public." Without dissent, the United States Supreme Court affirmed the decision.

The wisdom of these decisions by the nation's highest courts justifies the medical profession's educational program of alerting the nation to the public health threat posed by the cult of chiropractic.

Patients should entrust their health care only to those who have a broad scientific knowledge of diseases and ailments of all kinds, and who are capable of diagnosing and treating them with all the resources of modern medicine. The delay of proper medical care caused by chiropractors and their opposition to the many scientific advances in modern medicine, such as life saving vaccines, often ends with tragic results.

ON APRIL 19, THE HOUSE OF DELEGATES:

1. Honored deceased members of the Faculty in the previous year.

2. Received the 1967 budget, for information purposes only, and approved the auditor's report for the 1966 year.

3. Heard a report from the Treasurer that the Faculty had received the Walter R. Steiner, MD, Trust as remainderman, and an additional sum to be added to the Hundley Memorial Lecture Fund.

4. Approved Emeritus membership for:
H. Wayne Glickfield, MD, Prince George's County
Philip J. Hirshman, MD, Washington County

5. Heard Dean Thomas B. Turner discuss the Regional Medical Program for Heart Disease, Cancer and Stroke. Dr. Turner is scheduled to assume the post of coordinator of this program on July 1, 1967.

6. Adopted the following motion:
Resolved: That the sum of $15,600 be allocated from the Educational Fund of the Faculty for the continuation of the Medic Network for the period from July 1967 to July 1968.

7. Received the report of the Nominating Committee.

8. Saw the President honor the following Fifty-Year Members with the presentation of Fifty-Year pins:
Theodore H. Morrison, MD
George McLean, MD

9. Adopted various Bylaw amendments.

10. Received various Committee reports for information purposes.

11. Commended the Legislative Committee chairman for his extensive efforts during the 1967 General Assembly session.

ON APRIL 20, THE FACULTY MEMBERSHIP IN GENERAL SESSION:

Elected the following to the Board of Medical Examiners for a four-year term:

John H. Hornbaker, MD, Hagerstown
Frank K. Morris, MD, Baltimore

ON APRIL 21, THE COUNCIL:

1. Elected as Chairman, Russell S. Fisher, MD, and as Vice-Chairman, John F. Schaefer, MD.

2. Authorized the Council Chairman, the President and the Legislative Chairman to compose comments on a letter sent by the State Health Commissioner to the Governor with respect to Senate Bill 486 (providing for payments to Optometrists under the medical care program, and other changes in the law dealing with the operation of this program).

3. Approved the dispatch of the following telegram to WMAR-TV (Channel 2) in response to one profferring public service time for a debate on Chiropractic: "When Chiropractors elevate their standards to those of scientific medicine, we will be glad to debate with them."

ON APRIL 21, THE HOUSE OF DELEGATES:

1. Elected the following slate of officers, for terms as indicated, by unanimous consent:

President-elect
Arthur G. Siwinski, Baltimore—President-elect 1967-68; President 1968-69

First Vice-President
Henry A. Briele, Sailsbury

Second Vice-President
Wolcott L. Etienne, College Park

Third Vice-President

CONSOLIDATED . . . . .

solves your billing and collection problems

- Touch-tone card dialer transmits service and fee data quickly, easily
- Consolidated handles all billing and collection
- Physician receives payment in full within one week
- Moderate service charge

A complete billing service

Consolidated Services is a centralized billing and collection service which places the physician on an immediate cash basis. Using a touch-tone dialer and prepunched data cards (supplied by Consolidated) your record of patients, services, and fees is transmitted in seconds. Consolidated does the rest, and remits fees in full to the physician (less a modest discount) within one week from billing date.

How the physician benefits

The physician is relieved of all billing and collection, stationery, postage and clerical costs. AND accounts receivable are turned into immediate cash!

Optional payment plans

Five payment plans are available to physician and patient, including: Straight billing, 90-day payment at no extra charge to patient. . . .

You have a choice of Billing
On Your Personal Billheads
Or
On Group Billheads

Modest cost

Consolidated applies a basic service charge of only 5% to 7% dependent upon size and volume of practice. No cost for equipment, supplies, reports, etc.

For complete information, call for appointment. Phone 486-4984/8935

From Washington

The American Medical Association favors utilizing Medicaid instead of expanding Medicare. Charles Hudson, MD, AMA president, outlined the Association's position at a House Ways & Means Committee hearing on the administration's bill "Social Security Amendments of 1967" (H.R. 5710). He was accompanied by Milford O. Rouse, MD, AMA president-elect.

"Available tax funds should be used to give maximum health care to those who need help," Dr. Hudson said. "Expenditure of public funds on those who do not need help limits the resources available to those who do need it. . . .

"We believe that a properly administered Title 19 (Medicaid) with realistic criteria of eligibility designed for economically disadvantaged persons, plus the encouragement and improvement of voluntary health insurance and prepayment plans for the solvent, provide the best approach to health care financing."

Dr. Hudson said AMA representatives would be glad to meet with the Committee and other interested parties to hammer out a workable approach to solving the many complex problems in the Medicare program, particularly with respect to Part B.

"Unfortunately, Part B did not receive an amount of public or congressional debate warranted by the nature and scope of the proposal," he said. "This committee is now confronted with many problems inherent in the vast undertaking of the federal government in becoming directly involved in the total health care of almost 20 million persons.

"We believe it is possible for the Congress, the medical profession and others interested in the subject to develop a new mechanism for delivering medical care to people over 65 that would be more consistent with existing private sector mechanisms. . . ."

Dr. Hudson said that carriers, physicians, patients, and the government all are dissatisfied for various reasons with Part B. He said one possible solution might be to substitute for the Part B program a subsidy to all eligible persons for the purchase of private insurance.

Highlights of AMA testimony included:

Section 125, to include the disabled—The adoption of Section 125 . . . could change the direction of Medicare from a program for older persons to one aimed at various select categories . . . we urge the Committee to reject this provision.

Section 127, to include podiatry—While recognizing the usefulness of podiatry services, we are impelled to note that if the amendment is adopted, the podiatrist could assume responsibility for the care of some of the more difficult problems in medicine. We believe this to be unsound.

Section 130, to create a Part C of Title 18—This section would provide a new *Part C* to cover payment for hospital services rendered to hospital outpatients, and for diagnostic specialty services to both outpatients and inpatients of hospitals. The AMA opposes Part C *in toto*.

Section 131, to eliminate physician certification—The AMA endorses Section 131, which would remove the requirement of a physician's certification for inpatient hospital care for each Medicare patient admitted to a general hospital. We urge the Committee to consider this amendment favorably and remove an unnecessary impediment to the operation of Part A.

We further urge that the requirement for re-certification be similarly deleted, since this need should be satisfied as a result of the work of utilization review committees.

Until re-certification is deleted, we suggest that the first certification date be the 20th day of hospitalization, as permitted in the existing law.

Section 220, to limit income maximum under Title 19—The AMA supports the concept of limiting eligibility for Title 19 benefits to persons who genuinely need financial assistance in meeting their health care needs.

Section 226, to provide free choice under Title 19—Although free choice is guaranteed for Title 18 recipients, a similar privilege was not extended to Title 19 beneficiaries. We believe this was an oversight, and we heartily support this perfecting amendment to Title 19.

Additional Amendments Proposed by the AMA

First, the AMA recommends that Title 18 be amended to permit payment of charges for professional services on the basis of a physician's itemized statement of charges rather than a receipted bill. Second, we recommend that Title 18 be amended to remove the requirement for three days of hospitalization before qualifying for extended care benefits. In addition, we offer a recommendation relating

A monthly summary of Washington news prepared in the Washington, DC, office of the American Medical Association.

to psychiatric care under Title 18.

Regarding Title 19, we offer six amendments:

First, that the program permit payment to the patient for services rendered to him by a physician on the basis of the physician's itemized statement of charges.

Second, that the program clearly provide for the payment of physician fees on the basis of his usual and customary charges, using the same approach as that applied under Title 18.

Third, that Title 19 encourage the use of insurance carriers in the implementation of state programs.

Fourth, that in the implementation of Title 19 programs, there be no requirement for certification or re-certification.

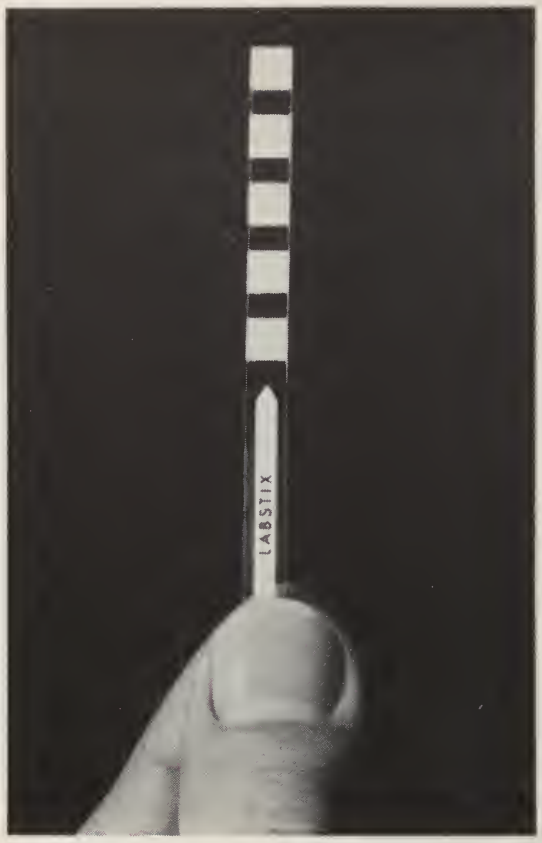
Fifth, that Title 19 permit all state plans to vary the eligibility standards within a state to recognize the very real differences in the cost of living in a rural area, a small town, a city or a metropolitan area.

Our sixth recommendation relates to the fact that Title 19 benefits differ for mentally ill patients depending on whether they are above or below age 65. We believe there should be no distinction in the services available to mentally ill patients.

Physician Coverage Under Social Security

We believe that physicians, having been brought under Social Security coverage, should be accorded the same privilege and opportunity for reaching a fully insured status as was accorded other professional groups when they were included in the program.

Accordingly, we urge this Committee to consider the adoption for physicians of an "alternative insured status" similar to that permitted by the amendments of 1954 and 1956, which brought into the program many new groups of people and professional self-employed persons, including lawyers.



GEORGETOWN TO ESTABLISH RADIO LINK WITH MEDICAL SCHOOLS IN OTHER COUNTRIES

Medical schools and hospitals throughout the world now have a new communication link with the United States. The new facility is a shortwave radio station, WA3FXJ, with studios on the campus of Georgetown University, according to Patrick J. Doyle, MD, professor and chairman of the Department of Community Medicine and International Health in the University's School of Medicine.

Financial support of the station is a joint project of the medical school and of Riker Laboratories, Northridge, Cal, pharmaceutical manufacturer, a division of Rexall Drug and Chemical Company.

The new unit is called Georgetown's "International Medical Amateur Radio Station." As far as is known, it is the first ham radio station in the United States used primarily for the teaching of medical students in other countries.

In a brief ceremony accepting a grant from

Take five...

LABSTIX® provides 5 important urinary findings*—on a single reagent strip! That's *more* information than you can get from any other single reagent strip. You know the results in just 30 seconds—while the patient is still in your office—and readings are reliable and reproducible. LABSTIX is easy to handle, too. Never goes limp, even when wet, because it's made with clear, firm plastic. And results with LABSTIX are easy to read—color contrast between the test areas and the transparent plastic is clearly defined. An unexpected "positive" from testing with LABSTIX may help in detecting hidden pathology before marked symptoms are manifest.

*Blood; ketones; glucose; protein, and pH.

...Plus one

You can extend your testing scope by including ICTOTEST® Reagent Tablets, the 30-second determination for bilirubinuria—which can be an early sign of obstruction of the common bile duct, infectious hepatitis, or other liver disease. This test is also useful for detecting liver damage from carbon tetrachloride and other halogenated hydrocarbons used as industrial and household solvents. Positive findings with the urine-testing team of LABSTIX and ICTOTEST can represent significant guides to patient management in many clinical situations. "Negatives" may help rule out suspected abnormalities over a broad clinical range and are important for the patient's record.

Riker, Dr. Doyle said, "Initially our purpose will be to provide a series of medical programs and an emergency consulting service for teaching purposes whenever and wherever the need exists. Also, this new unit will permit Georgetown physicians to consult with a number of prominent leaders in international health."

The radio station will be on the air in May, according to Sanford Vernick, MD, assistant professor in the Department of Biology at Georgetown, and a licensed amateur radio operator. Fifteen ham operators who are either faculty members or students will help operate the station.

Initial broadcasts will be between Georgetown and similar shortwave medical radio stations located at the University of Guayaquil Medical School in Guayaquil, Ecuador, and at medical missions in Latin America.

According to Drs. Doyle and Vernick, future radio contacts are planned between WA3FXJ and the Edinburgh School of Medicine in Scotland, and the radio station at the University of Mexico Medical School in Mexico City.

"Consultations between Georgetown and other 'stations' will also offer an exchange of information on medical techniques, drug information, nursing, medical administration, rehabilitation, and other areas of common interest," said Dr. Doyle.

From an April 1967 news release of Paul Klemtner & Co., Inc.

SENATOR TYDINGS PROPOSES CHANGES IN HEALTH CARE SYSTEM

Senator Joseph D. Tydings (D-Md) warns of "tremendous and terrible social and economic costs" inherent in this nation's system of health care and proposes a complete reorganization of the health care system. In a speech prepared for delivery at a banquet commemorating the 10th anniversary of the founding of Washington Hospital Center, the Senator said, "If our plan had been to create the most inefficient, most expensive system of health care possible, then we would have created a system very much like the one we have now."

It was read by Stephen J. Pollak, Presidential adviser for National Capitol Affairs. Senator Tydings was ill and unable to attend.

Noting that the system of health care now suffers from serious imbalances, he said the major

emphasis in health care is on the care of critically ill patients in hospitals—"this is the most expensive option available in the system, whether the costs are measured as economic costs or as social costs." The result of the emphasis on hospital care for critically ill patients is the neglect of prevention of disease and, where that fails, of early detection and treatment, Senator Tydings said.

"Our system can invent an artificial kidney and develop surgical techniques for transplanting living kidneys, but it cannot quite find the time to diagnose and treat high blood pressure before the kidneys are destroyed," he said.

"Our system is capable of great, even heroic efforts to save citizens at the brink of death, but it is often unable to serve the citizens before they have reached that brink."

Senator Tydings proposed new priorities for the health care system. The first priority, he said, should be the prevention of disease and the second major emphasis must be early diagnosis and treatment. The care of critically ill patients in hospitals should be the option of last resort in any system responsive to the needs of the citizens, he said. This would reverse the present priorities in health care, Senator Tydings said.

A second major proposals would be a reorganization of hospitals to make them genuine medical centers, providing comprehensive care rather than simply intensive care.

"Emergency rooms and outpatient clinics can no longer be administrative orphans hidden away in hospital basements," he said. These services, along with programs for long-term care, convalescent care and even home care, must be integral parts of the hospital system, he said.

Senator Tydings said the reforms must be made because the system of health care now faces collapse beneath the weight of its social and economic costs.

From Baltimore

PHYSICIAN REFERRALS INVITED IN COOPERATIVE STUDIES

The Medical Service of the US Public Health Service Hospital in Baltimore is actively participating in two cooperative research projects studying the influence of drugs on the morbidity and mortality in patients with mild or moderate hyper-

Blessed event?

Not entirely, when nausea and vomiting occur in early pregnancy. Emetrol offers prompt and safe relief. Local rather than systemic action provides emesis control on contact with the hyperactive G.I. tract.* In a study of 123 pregnant women, the drug produced measurable improvement in 79% of patients in controlling vomiting.[1]

tension and patients with coronary artery disease.

Physician referrals of selected patients to the Cooperative Study on the Treatment of Hypertension or to the Cooperative Coronary Heart Disease Drug Project would be welcomed. Both of these studies are National Heart Institute sponsored projects, and the Coronary Drug Project is approved by the American Heart Association. Patients referred for either study can be followed concurrently with the referring physician or will be followed completely by our hospital, contingent upon the discretion and desires of the referring physician and patient. A full and informed consent is obtained from each patient prior to his or her entry into the study, and patients' health and well-being are of major concern.

In his announcement of these studies, Nicholas P. Sinaly, MD, chief of Medical Service, US Public Health Service Hospital, described the Cooperative Study on the Treatment of Hypertension as "a double-blind study of males and females with mild to moderate hypertension (Diastolic BP 90-115 mm Hg), aged 21 to 55 years, over a seven-to-ten-year period." Dr. Sinaly's announcement also provided the following pertinent information:

1. *Excludable conditions for the study*—diabetes mellitus, cardiomegaly, arteriosclerotic heart disease or peripheral vascular disease, congestive heart failure, abnormal ECG, valvular heart disease, significant renal disease.
2. *Treatment*—rauwolfia-chlorothiazide combination, or placebo.
3. *Referrals*—call Mrs. Prout at the US Public Health Service Hospital, BE 5-3930, Ext 254/255/235.

The Cooperative Coronary Heart Disease Drug Project is described as "a five-year double-blind study comparing the effects of nicotinic acid, d thyroxine, clofibrate, conjugated estrogens, or placebo, on morbidity-mortality in males aged 30 to 64 with docomented myocardial infarction in the past." Excludable conditions for this study include the need for long-term anticoagulant therapy, diabetes requiring insulin, Class III or IV cardiac disease. Referrals can be made by calling: US Public Health Service Hospital, BE 5-3930, Ext 435.

GENERAL PRACTICE SCHOLARSHIPS

The first recommendation of the Governor's Commission to study the need of physicians in the State of Maryland is presently being implemented at the University of Maryland School of Medicine, where a new scholarship program, created by the 1965 Session of the Maryland General Assembly, went into effect this past fall. The ten scholarships, which provide an annual stipend of $1500, are awarded at the rate of ten a year by the State Scholarship Board. The successful candidates for 1967-1968 are:

Aldis Baltins
10502 Hutting Place
Silver Springs, Md

Richard Alan Bloomfield
607 Marshall Road
Glen Burnie, Md

James Stephen Murphy
Lexington Park, Md

David Browne Posner
Caveswood Lane
Owings Mills, Md

Wm. David Hakkarinen
910 Somerset Place
Hyattsville, Md

John Franklin Kressler
111 Fourth Ave, SE
Glen Burnie, Md

Stephen N. Levin
8810 Stephanie Road
Randallstown, Md

George Charles Samaras
228 Bay Bridge Road
Annapolis, Md

Michael Alan Silverman
814 Malibu Drive
Silver Springs, Md

John Wesley Wilson
1251 Vogt Avenue
Baltimore, Md

The scholarships are granted only to those students who have been admitted to the University of Maryland School of Medicine. Each candidate must have been a resident of Maryland for at least five years preceding the date of the award and must have received a bachelor's degree from an accredited institution.

Prior to the final awards, which are based on academic ability, aptitude and financial need, each recipient must give bond to the State of Maryland

★ This extended care facility is Approved by American Hospital Association.
★ One story new fire-safe construction.
★ No steps, ramps or elevators needed.
★ Inspection invited. Reasonable rates.
★ All facilities available to private physicians.

affirming that he will engage himself to serve as a general practitioner of medicine for three years in an area of need in this State. The area of need is to be determined by the State Department of Health in consultation with the Medical and Chirurgical Faculty of Maryland.

The Congress of Delegates of the American Academy of General Practice in October has created a student affiliate membership that provides these medical students with their first opportunity to be affiliated with an organization of practicing physicians. The President of the Maryland Academy of General Practice wrote each one of the scholarship recipients a personal letter inviting him to join the Maryland Academy of General Practice. *From the News Bulletin of MAGP and DCAGP, Spring 1967*

From Chevy Chase

Grants for eight projects to demonstrate or investigate new systems for disposing of solid wastes without endangering human health or contaminating the environment have been announced today by the Public Health Service's National Center for Urban and Industrial Health. The grants, awarded under the Center's Solid Wastes Program, total nearly $568,000.

The eight awards bring to 26 the number of demonstration or investigation projects now being conducted by local and state agencies with financial support from the Public Health Service. More than $3,110,000 has been committed for the 26 projects.

"Much of the success of the Solid Wastes Program depends on the development by local and state agencies of projects for new and improved approaches to solid wastes management which can qualify for two-thirds Federal support under the Solid Waste Disposal Act," said Leo Weaver, the Solid Wastes Program Chief. "Disposal practices in the United States are generally backward and insanitary partly because local and state governments have lacked funds to risk on advanced techniques and equipment. But this barrier to progress has been substantially removed by the availability of federal aid for bold and innovative demonstration projects. Communities and states now have the chance to try new approaches that could lead to great improvement in solid waste

disposal practices."

In addition to aiding demonstration and investigation projects, the Solid Wastes Program supports research and training, helps finance solid wastes planning by states, and provides technical assistance to local and state governments.

Several of the new projects are to merge individual community disposal operations into area-wide systems with improved health protection and efficiency. Others are to demonstrate advanced incineration with negligible air pollution. One project is to illustrate the feasibility of building an amphitheater and coasting ramp from solid waste sanitary landfills. Still another is to show that solid wastes can be used to reclaim and beautify abandoned strip mines.

Included among the eight grantees is the Maryland State Department of Health, which has been awarded $28,597 to demonstrate abandoned strip mine reclamation by conversion to sanitary landfills. The project director is Wilfred H. Shields, Jr., acting chief of the Department's Division of Solid Wastes.

From a US Public Health Service news release, April 1967.

From New York

The full dimensions of the nursing shortage in the United States were revealed today with the issuance of *Data,* a fact sheet on the nursing situation prepared by the National League for Nursing, New York.

The fact sheet states that there are 621,000 professional nurses employed today while the need is for 746,000—a shortage of 125,000. Prepared as background for the League's eighth biennial convention held May 8 to 12 at the New York Hilton Hotel, it was made public by Inez Haynes, RN, general director of the League.

"Authorities set the goal for 1970 at 850,000 to 1,000,000 active RNs," says the summary. "The bare facts show that the shortage can reach some 344,000—more than one-third the total need—in three years. This means thousands of budgeted staff vacancies in hospitals and other agencies, insufficient and improperly prepared faculty in many nursing education programs, and inadequate nursing for the American public."

A shortage of licensed practical nurses also

exists. The total number now employed is placed at 282,000, while the need is for 311,000.

"Actually," Miss Haynes explained, "the number of practicing registered nurses (RNs) has increased tremendously in the last ten years—from 430,000 to 621,000. I know no other profession that has grown more rapidly. But events have outstripped the growth. Not only have the population explosion, the growth of health insurance, and the advent of Medicare and Medicaid increased the demand for nurses, but more highly specialized knowledge is required of the modern nurse. Nursing responsibilities have increased proportionately to the increase in medical knowledge and techniques."

The "quality factor" is an important consideration in the supply and demand picture, she added. Physicians rely increasingly on professional nurses to help bring new surgical techniques, chemotherapy treatments, and rehabilitation methods to patients. This, in turn, means that a larger number of nurses with college degrees are needed for expert patient care, for supervisory posts in hospitals and clinics, and for teaching and administration.

The National League for Nursing, with 24,000 individual and 1,800 agency members, such as hospitals, nursing schools, public health agencies, and voluntary health associations, conducts programs across the country to encourage community action for the improvement of nursing services and nursing education. It accredits schools of professional and practical nursing and public health nursing agencies and provides testing services for evaluating the potential of pre-nursing students and the educational achievements of nurses and nursing students. Licensure tests for professional and practical nurses in the United States and Canada are prepared, distributed, and scored by the League.

HARTFORD FOUNDATION REPORTS $14,462,862 IN 1966 MEDICAL RESEARCH GRANTS

New pathways to the prevention, diagnosis and cure or palliation of many human afflictions were opened last year by medical investigations supported by The John A. Hartford Foundation, Inc., Ralph W. Burger, the Foundation's President declared in its 1966 annual report just issued.

funds for medical research, The John A. Hartford Foundation appropriated in 1966 a total of $14,462,862 for 82 new and continuing programs. This brought to 232 the active research and clinical projects it was funding through grants to 136 hospitals, medical schools and other research facilities in 69 communities in the United States and Canada, according to the report.

The projects, Mr. Burger stated, are almost as varied as medicine itself and employ the talents of virtually every known discipline relating to the health sciences.

"While no one field is more vital than another," he said, "We are especially pleased at having played a part in such pioneering research ventures as cryosurgery, hemodialysis for chronic uremia, medical applications of the laser, and the intensive-care concept now being widely used to save lives of both infants and adults."

Mr. Burger pointed out, however, that the basic causes of a large number of bodily dysfunctions are yet unidentified and, therefore, therapy is lacking or ineffectual. It is with this in mind, he added, that the Hartford Foundation continues its encouragement of medical research and, particularly, of investigations aimed at bringing laboratory-developed findings into clinical application.

From Chicago

"AMA JOURNAL" ESTABLISHES MEDICINE-RELIGION DEPARTMENT

Physicians have long been troubled by the knowledge that playing the role of healer sometimes requires them to "play God," too.

Consider this case and the attendant questions:

A 10-year-old Louisiana boy is dying from kidney disease. The physician knows it is possible to transplant a kidney from the boy's healthy twin brother, leaving the healthy twin with one kidney.

Sometimes the operation fails, but in a number of cases, it succeeds; more than 500 people are alive today with transplanted kidneys.

Regardless of whether the sick boy recovers, however, the physician is haunted by one thought: suppose something goes wrong with the healthy twin's remaining kidney. A person can live a normal life with one

"George wants to know if it's okay to take his cold medicine now, Doctor, instead of seven o'clock?"

The long-continued action of Novahistine LP should help you both get a good night's sleep. Two tablets in the morning and two in the evening will usually provide round-the-clock relief by helping clear congested air passages for freer breathing. Novahistine LP also helps restore normal mucus secretion and ciliary activity—normal physiologic defenses against infection of the respiratory tract. Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result. Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

NEW!..... MED-CHI LIFE INSURANCE PROGRAM

Now you have the opportunity to repair the damage done to your family protection program by inflation . . . and at an unusually low cost. The new official Med-Chi Life Insurance Plan was created to give members an opportunity to fulfill their plans for the security of their wives and children. As a result of the sharp increase in the cost of living during the past decade, many a Med-Chi member has discovered that his present life insurance program is no longer adequate in relation to the needs of his family.

To help solve this problem the Med-Chi Insurance Committee recommended the program of The Minnesota Mutual Life Insurance Company for adoption by the faculty. The Board of Trustees approved the action of the committee and endorsed the program for participation by all Med-Chi members.

FEATURES OF THE NEW PROGRAM:

- **Up to $20,000 of life insurance**
- **Up to $60,000 Accidental Death Benefit**
- **Available to all Med-Chi members under age 70**
- **Competitive rates**
- **Premiums are unconditionally guaranteed**
- **Generally no physical examination required**

The only officially recommended, approved and endorsed life plan of the faculty is underwritten by The Minnesota Mutual Life Insurance Company of Saint Paul, Minnesota. The Company, with over $6.3 billion of life insurance in force, ranks in size among the top 2% of all life insurance companies in the world.

One-Half Sodium Secobarbital
supplied in ¾, 1½, and 3-grain Pulvules

Tuinal helps wakeful patients fall asleep fast, stay asleep all night.

Indications: Tuinal, comprised of equal parts of Seconal® Sodium (sodium secobarbital, Lilly) and Amytal® Sodium (sodium amobarbital, Lilly), is indicated for prompt and moderately long-acting hypnosis. Not suitable for continuous daytime sedation.

Contraindications: Barbiturates should not be administered to anyone with a history of porphyria, nor should they be given in the presence of uncontrolled pain, because excitement may result.

Warning: May be habit-forming.

Precautions: Tuinal should be used cautiously in patients with decreased liver function, since prolongation of effect may occur.

Adverse Reactions: Idiosyncrasy, such as excitement, hangover, or pain, may appear. Hypersensitivity reactions occur in some patients, especially in those with asthma, urticaria, or angioneurotic edema.

Dosage: 1½ to 3 grains at bedtime.

Additional information available to physicians upon request.

DIURESIS

MERCUHYDRIN®
(meralluride injection)

Twenty years ago the publication of "A System for the Routine Treatment of the Failing Heart"[1] established a schedule of diuretic therapy as a primary factor in the treatment of acute congestive failure. With emphasis upon daily injections of Mercuhydrin (meralluride injection) until dry weight was obtained, Gold, et al. achieved a 40% increase in improvement, in ⅓ the time, over other methods then current. Today, most medical texts continue to recommend parenteral mercurials in acute congestive failure when prompt diuresis is indicated.

Recently Modell[2] has stated: "The mercurial diuretics are the injectable diuretics of choice since they are the most potent as well as the most dependable. Their toxicity is not an important consideration either by comparison with other potent diuretics or in relation to the seriousness of the conditions in which they provide such excellent relief."

LAKESIDE

IN BRIEF

Mercuhydrin is indicated in edema of cardiac or hepatic origin and in the nephrotic syndrome; it is contraindicated in acute nephritis and in anuric or oliguric states. *The usual adult dose is one to two cc. daily or every other day until "dry weight" is obtained.* Sensitivity is rare but small initial doses are advised to minimize potential reactions; vertigo, fever, and rash have occurred. Overdosage may produce electrolyte depletion, muscle cramps, and G.I. reactions. Supplied: 1 cc. and 2 cc. ampuls in boxes of 12, 25 and 100; 10 cc. rubber capped, multiple-dose vials (intramuscular or subcutaneous use only) in boxes of 6 and 100.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

kidney—that is what supports the theory of transplantation from live donors—but one cannot live without any kidneys. Disease could cut down the boy at any time.

By deliberately removing a healthy, functioning part of the boy's body, has the physician consigned him to possible future death?

Or are the parents responsible? They gave permission for the operations. Was the physician merely a technician, carrying out their orders?

And what of the healthy boy? He is a minor. Does he have any rights in the matter? Could there be a case in which parents used unusual coercion on such a child to save the life of another?

These are some of the questions that trouble medical men of conscience on transplantation. Other areas of medicine present similar questions of ethics and morality.

This is why *JAMA*, the Journal of the American Medical Association, has begun a new section, "Medicine and Religion," designed to discuss these issues. The first question-and-answer section (on transplantation) appeared in the April 10 issue.

Here is part of what Joseph E. Murray, MD, a Boston surgeon, had to say about the problem of the 10-year-old twins:

"Organ transplants, as a therapeutic maneuver to prolong life, are certainly justified as far as the recipient is concerned. The source of the kidney, however, provides a major moral, legal, and ethical problem. If the source is a recently deceased individual whose nearest relatives have voluntarily donated the kidney, there is no problem. If the source is an elective (kidney removal) for the benefit of another human being, and a kidney is used which would otherwise be discarded, again, there is no problem. However, when the donor is a living healthy volunteer, either a member or a nonmember of the family, a definite problem arises. Here we are embarking on a major surgical operation with a slight, but definite, risk from anesthesia, operation, or postoperative complications.

"This procedure is not for the benefit of the person being operated on, but for someone else. All previous medical and surgical training has been geared to weighing the advantages and disadvantages in any one patient of a proposed therapeutic measure. In this instance, however, for the donor a physiological deficit will always occur, and no possible good can accrue to him physically."

Dr. Murray pointed out, however, that the kidney donor may derive "a certain spiritual benefit" from the donation, which is "probably the purest form of charity next to the giving of one's life. For a truly unpressured volunteer, this spiritual satisfaction can more than compensate for the physical trial of a nephrectomy."

The courts in various states have recognized the validity of a kidney donation by a minor child "on the principle that the child would be harmed psychologically, spiritually, and aesthetically if he were deprived of the opportunity of donating a kidney to save his identical twin," Dr. Murray said.

The question concerning the twins' kidney exchange came from a Louisiana physician, who requested the opinion of a priest because the family is Catholic.

Said the Rev. John J. Lynch, of Weston, Mass: "It should first be noted that on the question of organic transplantation inter vivos (from one living person to another), the Roman Catholic church has never yet declared an official teaching."

Private theologians, however, have been discussing the problem ever since transplantation became a medical practicality, Father Lynch said.

"Those who challenge the permissibility of this form of organic transplantation do so because of a sincere conviction that only when it is necessary for one's own total medical good may one sacrifice a bodily member," he said. "In substantiation of this premise they are able to cite several papal statements which seem to concur with their position. And since the donor in a transplant transaction has physically only loss to show for his pains, this school of thought concludes—most logically, if their premise be granted—to a prohibition against the procedure.

"Those who defend the . . . procedure deny the . . . principle which would allow bodily mutilation only for the total good of the patient himself. They maintain that the law of fraternal love—whereby one may do for another whatever one may legitimately do for self—can also be invoked in justification of certain organic transplants. Their reasons, though weighty, are not altogether conclusive theologically; but neither are the contrary arguments submitted by the opposition," Father Lynch said.

Where does this theological deadlock leave the conscientious physician—in this case, the Roman Catholic physician?

"On the supposition that proper consent is obtained, it leaves him entirely free to follow in practice, if he so chooses, the opinion which grants him the greater liberty of medical action," Father Lynch said. "No theologian could legitimately accuse of moral wrongdoing the physician who involves himself professionally in organic transplantation with due regard for those precau-

tions which sound medical sense would prescribe for that procedure.

"Or, to put it more positively, the doctor, who in medical prudence seeks to preserve human life by means of organic transplantation can merit no less theologically than he does scientifically," Father Lynch said.

In coming weeks, the Medicine and Religion section of *JAMA* will discuss such topics as the relationship of psychiatry and religious counseling in caring for the hospitalized patient, and the role of physicians and clergymen in maintaining the patient's privacy while giving him maximum care. Physicians and clergymen of various religious faiths will discuss these questions.

The AMA's Board of Trustees established a Committee on Medicine and Religion in 1963. Under the direction of the Rev. Paul B. McCleave, subcommittees have been set up in medical societies in every state.

"The primary purpose was to create a climate in which doctors and their clergymen colleagues—ministers, priests, and rabbis—could work together most effectively," a *JAMA* editorial said. "At the bedside and in conferences, they are trying seriously to explore their mutual role in treating the whole man as they deal with his physical, mental, and emotional disorders. Scores of dialogues among physicians and between physicians and the clergy are taking place."

"Hopefully, physicians engaged in all of the many facets of American medicine will be stimulated to send in questions pertaining to this fascinating field," said Paul S. Rhoads, MD, chairman of the AMA Committee on Medicine and Religion.

Physicians' queries should be based upon specific clinical situations or social problems, and details should be limited to nine or ten sentences. Queries should be sent to Alfred Soffer, MD, 535 N Dearborn St, Chicago, Ill 60610.

From an AMA news release, April 1967.

"Just what the Doctor ordered!"

An Ideal Week-end Vacation Paradise

Facilities for complete rest and relaxation for you or your patients

Great Oak CLUB

Great Oak is a wonderful haven located on beautiful Chesapeake Bay on Maryland's fabulous Eastern Shore. Just a pleasant drive from Baltimore or Washington, over the Bay Bridge. Every facility for comfort, sport and relaxation . . . beautiful lodging, sumptuous dining . . . challenging 18 hole golf course, yachting, swimming, skeet and trap shooting—hunting in season . . . plus a complete program of social activities.

Open the year 'round . . . an ideal second club for the family, for vacationing or week-end fun.

MEMBERSHIPS START AS LOW AS $60.00 ANNUALLY

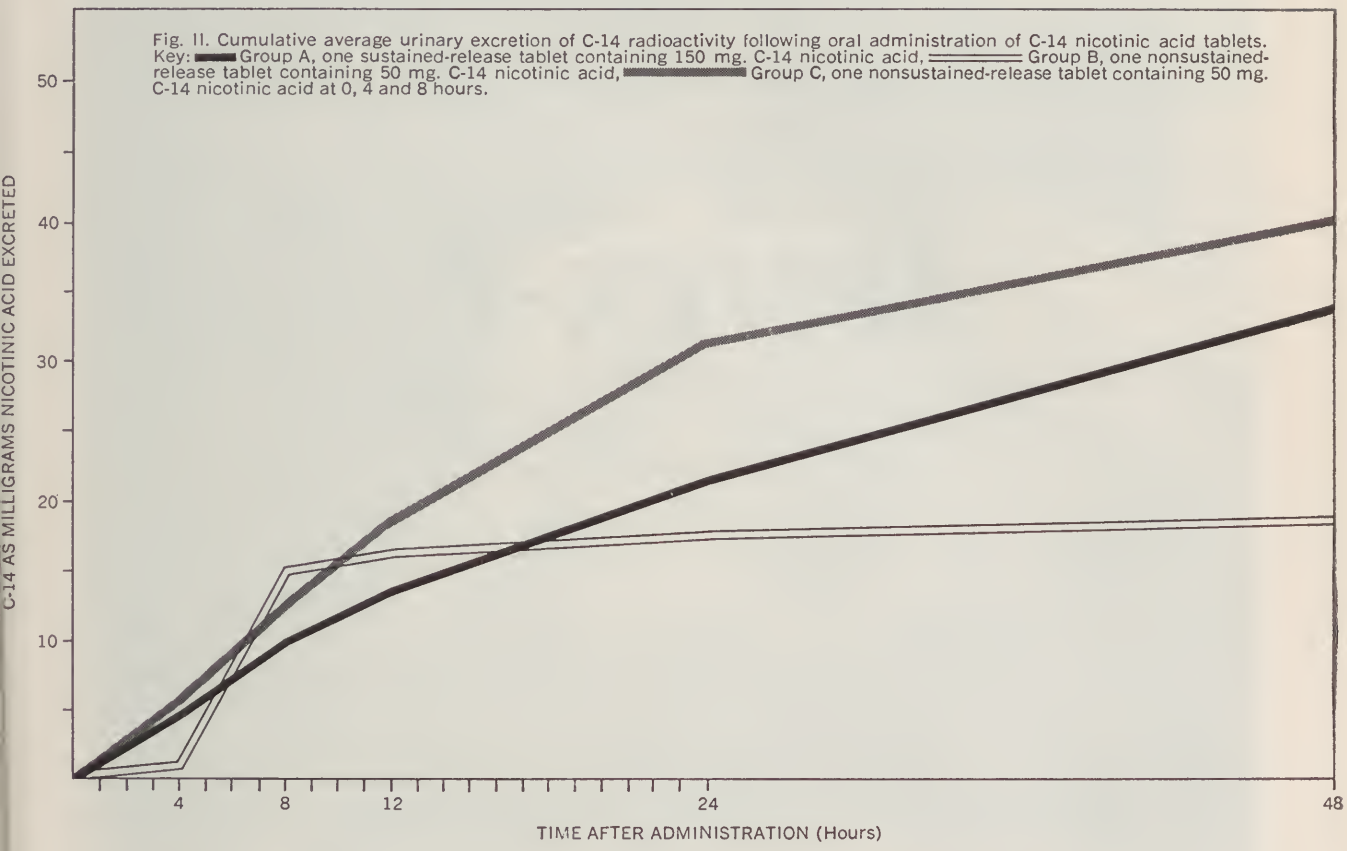
Sustained circulatory, respiratory and cerebral stimulation for the

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

ged and debilitated

ess confused and moody. Personal care, memory, motional stability, social attention improve. Fatigue, pathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will ermit your patients to enjoy the benefits of time-rolonged nicotinic acid/pentylenetetrazol therapy, t an economical price. Dosage is only one tablet every 2 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

Geroniazol® TT

nicotinic acid 150 mg., pentylenetetrazol 300 mg.
Tempotrol® Time Controlled Tablet

Don't let monilia cut broad-spectrum therapy short...

start with Tetrex-F®

tetracycline phosphate complex-nystatin

Use of broad-spectrum antibiotics can cause fungal overgrowth in the alimentary tract... and give rise to symptoms so troublesome that therapy must be prematurely stopped. Tetrex-F (tetracycline phosphate complex-nystatin) helps you circumvent this problem.

The nystatin can prevent overgrowth of monilia; the phosphate complex delivers tetracycline to the blood rapidly. Side effects are infrequent.

High-Risk Patients

Tetrex-F (tetracycline phosphate complex-nystatin) is especially useful in patients most susceptible to fungal overgrowth during tetracycline therapy: (1) the elderly or debilitated, (2) young children, (3) the diabetic, (4) those on long-term tetracycline therapy, (5) those on steroid therapy, (6) those who have had moniliasis before, and (7) pregnant patients with a history of monilial vaginitis.

When you start with economical Tetrex-F (tetracycline phosphate complex-nystatin), you can complete the full course of broad-spectrum therapy with less chance of losing control elsewhere. A good start for a healthy finish.

PRESCRIBING INFORMATION. For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfections may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule q.i.d. Continue for 10 days in Beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals. *Supplied:* Capsules, bottles of 16 and 100. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin. For Oral Suspension, 125 mg. tetracycline and 125,000 u. nystatin/5 ml., 60 ml. bottles.

Night Leg Cramps... Frequent Bedfellow
In Diabetes,[1] Arthritis,[2] and Peripheral Vascular Disorders[2]

now... specific therapy for night leg cramps

QUINAMM™

Consistently effective, QUINAMM provided complete relief in 94% of 200 patients studied, many of whom were severe cases refractory to other medication.[3] Your prescription for one tablet at bedtime often controls painful night cramps with the initial dose . . . helps restore restful sleep.

QUINAMM Prescribing Information: Composition: Each white, beveled, compressed tablet contains: Quinine Sulfate 4 grains (250 mg.) and Aminophylline 3 grains (200 mg.). **Precautions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastraintestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Contraindication:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets. **Caution:** Federal law prohibits dispensing without prescription.

BUSINESS SESSIONS

ANNUAL MEETING
April 19, 1967

MINUTES

The 256th meeting, first of the 169th Annual Session of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland, was held at The Alcazar, Baltimore, Maryland, at 9:40 AM, Wednesday, April 19, 1967, the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance; an asterisk indicates an alternate delegate:

Doctors: Manning W. Alden, Council; Robert G. Angle, Montgomery County; Timothy D. Baker, Baltimore City; John G. Ball, Montgomery County; Edward M. Barczak, Baltimore City; Richard D. Bauer, Council; Paul F. Guerin, MD, Baltimore City; Harry McB. Beck, Baltimore City; M. McKendree Boyer Past-President; Henry A. Briele, Council; Wendell J. Burkett, Kent County; Robert vanL. Campbell, Council; Douglas G. Carroll, Baltimore City; *Katherine A. Chapman, Montgomery County; H. Douglas Cooper, Wicomico County; Ernest I. Cornbrooks, Jr., Baltimore City; *Kenneth Cruze, Montgomery County; William B. Culwell, Carroll County; Worth B. Daniels, Baltimore City; Henry V. Davis, Cecil County; Melvin B. Davis, Baltimore County; John D. DeHoff, Baltimore City; DeWitt E. DeLawter, Montgomery County; J. Sheldon Eastland, Council; William Carl Ebeling, Council; Emanuel S. Ellison, Baltimore City; Robert W. Farr, Council; Vincent J. Fiocco, Jr., Carroll County; Whitmer B. Firor, Past-President; Russell S. Fisher, Council; Harold H. Gist, Washington County; William B. Hagan, Council; Louis E. Harmon, Baltimore City; John S. Haught, Prince George's County; William G. Helfrich, Baltimore City; Thomas F. Herbert, Howard County; Philip W. Heuman, Harford County; James P. Jarboe, St. Mary's County; Frederick M. Johnson, Charles County; Ferd E. Kadan, Baltimore City; James R. Karns, Baltimore City; Fayne A. Kayser, Council; Lauriston L. Keown, Baltimore City; Robert C. Kimberly, Council; Howard F. Kinnamon, Past-President; Louis Krause, Council; *John I. F. Knud-Hansen, Talbot County; Edward L. J. Krieg, Baltimore County; Henry P. Laughlin, Council; C. Rodney Layton, Queen Anne's County; Herbert H. Leighton, Garrett County; Charles H. Ligon, Montgomery County; *James McCarter, Dorchester County; William J. Mclafferty, Baltimore City; George S. Malouf, Prince George's County; Karl F. Mech, Council; B. Martin Middleton, Council; John E. Miller, Baltimore City; Donald W. Mintzer, Baltimore City; Frank K. Morris, Board of Medical Examiners; G. Allen Moulton, Jr., Allegany County; Frederick E. Musser, Prince George's County; Clayton Norton, Anne Arundel County; Richard Norment, III, Council; Charles F. O'Donnell, Council; Hilary T. O'Herlihy, Anne Arundel County; William A. Pillsbury, Council; *Carolyn S. Pincock, Montgomery County; Harold B. Plummer, Caroline County; Frank E. Poole, Wicomico County; J. Emmett Queen, Council; C. G. Rawley, Somerset County; Belden R. Reap, Montgomery County; J. Morris Reese, Council; Guy M. Reeser, Talbot County; Thomas Reid, Frederick County; Paul F. Richardson, Baltimore City; *James A. Roberts, Montgomery County; Raymond C. V. Robinson, Baltimore City; Donald J. Roop, Council; Salvador Rossello, Baltimore City; *Peter Santucci, Montgomery County; John F. Schaefer, Council; Emmanuel Schimunek, Baltimore City; Simons, Allegany County; Thaddeus C. Siwinski, Baltimore County; R. Kennedy Skipton, Prince George's County; Omar D. Sprecher, Jr., Washington County; Martin E. Strobel, Baltimore County; E. L. Suarez-Murias, Baltimore City; Thomas E. Van Metre, Jr., Baltimore City; Merton T. Waite, Anne Arundel County; Emerson C. Walden, Baltimore City; Hugh W. Ward, Calvert County; William H. F. Warthen, Past-President; J. Arthur Weinberg, Council; William C. Weintraub, Prince George's County; Lawrence R. Wharton, Jr., Baltimore City; Daniel Wilfson, Jr., Baltimore City; Charles H. Williams, Baltimore County; Eldridge H. Wolff, Council; Donald O. Wood, Baltimore County; Charles E. Wright, Frederick County; John D. Young, Jr., Baltimore City; Raymond M. Yow, Council.

Present also for the meeting were staff personnel.

The president made several announcements concerning the transaction of business at the meeting and for the information of the delegates.

MINUTES

The minutes of the September 9, 1966, session having been approved by the Executive Committee and having been distributed to all delegates were presented to the House for information.

GUEST INTRODUCED

Richard E. Flood, MD, President of the West Virginia Medical Scoeity, was introduced to the House.

NECROLOGY

After the Secretary read the following names of deceased menbers, the House of Delegates members rose in observance of a moment's silence in respect for their deceased colleagues:

Anne Arundel County

Johnson, Theodore H.	June 24, 1966

Baltimore City

Baggot, Bartus T.	June 13, 1966
Beck, Nathaniel M.	September 1, 1966

TREASURER'S REPORT

The Treasurer then presented his report for the year 1966, which had been distributed. The Auditor's report was approved by unanimous consent.

TREASURER'S SUPPLEMENTAL REPORT

The Teasurer then presented a supplemental report outlining the receipt by the Faculty as remainderman of funds from the Walter R. Steiner Estate; as well as an additional contribution to the Hundley Memorial Lecture Fund from Mrs. J. Mason Hundley, Jr.

EMERITUS MEMBERSHIP

On motion of the Chairman of the Council, the following members who had received the recommendation of the Council, were elected to Emeritus Membership:

Prince George's County—H. Wayne Glickfield, MD

Washington County—Philip J. Hirshman, MD

REGIONAL MEDICAL PROGRAM FOR HEART DISEASE, CANCER AND STROKE

Thomas B. Turner, MD, Dean of The Johns Hopkins Medical School and newly-appointed coordinator of the Regional Medical Program for Heart Disease, Cancer and Stroke, was introduced to the House and spoke briefly on the concepts involved in the program and its formation and operation in the near future.

EDUCATIONAL FUND APPROPRIATION

Dr. Heldrich was by unanimous consent granted leave to present the report of the Committee on Postgraduate Education, Preventive Medicine and Public Health in the absence of its chairman. On behalf of the Chairman, the following motion was adopted unanimously:

Resolved, That the sum of $15,600 be allocated from the Educational Fund of the Faculty for the continuation of the Medic Network for the period from July 1967 to July 1968.

NOMINATING COMMITTEE REPORT

Dr. Campbell, Nominating Committee Chairman, presented the following slate:

President-elect
- Arthur G. Siwinski, Baltimore (President-elect 1967-68; President 1968-69)

First Vice-president
- Henry A. Briele, Salisbury

Second Vice-president
- Wolcott, L. Etienne, College Park

Third Vice-president
- George O. Eaton, Baltimore

Secretary
- William A. Pillsbury, Timonium

Treasurer
- Karl F. Mech, Baltimore

Councilors
- John M. Dennis, Baltimore, Central District (1971)
- Harry M. Robinson, Jr. Baltimore, Central District (1971)
- Donald J. Roop, Baltimore, Central District (1971)
- Raymond M. Yow, Salisbury, Eastern District (1971)
- J. Parran Jarboe, La Plata, Southern District (1971)

Delegate to American Medical Association
- J. Sheldon Eastland, Baltimore (Jan. 1, 1968-Dec. 31, 1970)

Alternate Delegate to American Medical Association
- Robert C. Kimberly, Baltimore (Jan. 1, 1968-Dec. 31, 1970)

Committee on Program and Arrangements
- John B. De Hoff, Baltimore (1972)

Library and History Committee
- Robert B. Goldstein, Baltimore (1973)

Finney Fund Committee
- Richard W. TeLinde, Baltimore (1973)

Board of Medical Examiners
John H. Hornbaker, Hagerstown (June 1967-June 1971)
Frank K. Morris, Baltimore (June 1967-June 1971)

The floor was opened to further nominations for these offices and there being none, nominations were closed by general consent. The election is to be held at the second meeting of the session, Friday, April 21, 1967, at the Faculty Building. The nominees for the Board of Medical Examiners are to be elected at the General Session, Thursday, 12:15 PM, April 20, 1967, at The Alcazar.

PRESIDENT-ELECT OF AMA

Milford O. Rouse, MD, President-elect of the AMA, was introduced to the House and presented greetings from the American Medical Association.

FIFTY-YEAR PIN PRESENTATION

The President, on behalf of the Faculty, then presented Fifty-Year pins to these members who were able to be present at this session:
Theodore H. Morrison, MD
George McLean, MD

BYLAWS COMMITTEE REPORT

Dr. O'Donnell, Bylaws Committee Chairman, on its behalf, moved the adoption of the following Bylaw amendments which, after debate, were adopted in each case by more than the required two-thirds vote:

Amend Article I, Section 1, by adding: "Membership in a component society shall carry with it membership in the appropriate class of membership in the Faculty."

Amend Article II, Section 4, by striking out the word "active" before the word "members."

Amend Article III, Section 4, by striking out the second sentence and inserting: "Any member whose dues are unpaid by March 1 each year shall be deemed to be not in good standing and shall forfeit all rights in the Faculty and its components, and shall not be reinstated until after the Annual Meeting and all arrearages are paid. If the member's dues are not paid up by December 31 of that year he shall be dropped from the roll of members."

Amend Article VII, Section 2, Clause 9, by substituting for it the following: "Appoint an Editor of the *Maryland State Medical Journal* for a term of three years or until his successor is appointed."

Amend Article XII, Section 2, by striking out "After consideration of the merits of the case."

INFORMATION COMMITTEE REPORTS

The following reports were distributed in writing for the information of the meeting and an opportunity was afforded at this time to raise any questions:

Report of the Delegates to the American Medical Association—Robert vL. Campbell, MD, J. Sheldon Eastland, MD, Russell S. Fisher, MD, December, 1966, Clinical Meeting
Secretary—William A. Pillsbury, MD
Board of Medical Examiners—Frank K. Morris, MD, Secretary
Executive Secretary—Mr. John Sargeant
Library and History Committee and Finney Fund Committee—Louis Krause, MD, and D. C. W. Finney, MD
Curator—Edwin David Weinberg, MD
Committee on Program and Arrangements—James B. Brooks, MD
American Medical Education and Research Foundation Committee—William S. Stone, MD
Committee on Contractual Arrangements—Belden R. Reap, MD
Economics Committee—Paul F. Guerin, MD
Editorial Board, *Maryland State Medical Journal*—C. Thomas Flotte, MD
Committee on Emotional Health—Augusto J. Esquibel, MD
Fee Schedule Committee—William G. Speed, III, MD
Finance Committee—Karl F. Mech, MD
Legslative Committee—Martin Middleton, MD
Liaison Committee—William L. Stewart, MD
Maryland Medical Service, Board of Trustees—J. Sheldon Eastland, MD, President
Med-Chi Insurance Trust—Paul F. Guerin, MD
Mediation Committee—Wolcott L. Etienne, MD
Medical Emergency Disaster Service Committee—Charles J. Savarese, MD
Medicolegal Committee—Howard F. Kinnamon, MD
Membership Committee—Nathan E. Needle, MD
Occupational Health Committee—John R. Davis, MD
Policy and Planning Committee—Eldridge H. Wolff, MD
Public Relations Committee—Manning W. Alden, MD
Representatives on the Medical Advisory Committee of the Red Cross Blood Bank Program.

LEGISLATIVE COMMITTEE COMMENDATION

Dr. Mech moved, "That the Legislative Committee and, in particular, its chairman, Dr. Middleton, be commended for the outstanding work done at the General Assembly session in Annapolis during 1967 and that the House also express commendation to the Executive Secretary for the fine work in this area." The House unanimously adopted such a commendation.

ADJOURNMENT

There being no further business, the House adjourned at 10:45 AM.

WILLIAM A. PILLSBURY, MD, Secretary

ELECTION OF THE BOARD OF MEDICAL EXAMINERS OF MARYLAND

A general meeting of the Medical and Chirurgical Faculty was held on Thursday, April 20, 1967, at 12:15 PM at The Alcazar, Cathedral and Madison Streets, Baltimore, for the purpose of electing two members of the Board of Medical Examiners of Maryland.

The President, J. Morris Reese, MD, presided and called the meeting to order.

The names of the two nominees were presented to the General Meeting, as follows:

John H. Hornbaker, MD (June, 1967-June, 1971)
Frank K. Morris, MD (June, 1967-June, 1971)

Nominations from the floor were requested. There being none, the Chairman declared nominations closed.

Elections took place by acclamation, and the Secretary, William A. Pillsbury, MD, was instructed to cast one ballot for those nominated.

There being no further business, the meeting adjourned at 12:30 PM.

WILLIAM A. PILLSBURY, MD, Secretary

MINUTES

The 257th meeting, second of the 169th Annual Session, of the House of Delgates of the Medical and Chirurgical Faculty of the State of Maryland, was held at the Faculty Building, 1211 Cathedral Street, Baltimore, Maryland, at 2:10 PM, Friday, April 21, 1967, the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance; an asterisk indicates an alternate delegate:

Doctors: Manning W. Alden, Council; Robert G. Angle, Montgomery County; Timothy D. Baker, Baltimore City; John G. Ball, Montgomery County; Richard D. Bauer, Council; *Philip J. Bean, St. Mary's County; Donald W. Benson, Baltimore City; M. McKendree Boyer, Past-President; Henry A. Briele, Council; Read N. Calvert, Montgomery County; Robert vanL. Campbell, Council; Douglas G. Carroll, Baltimore City; Robert G. Chambers, Baltimore City; *Katherine A. Chapman, Montgomery County; Henry V. Chase, Council; H. Douglas Cooper, Wicomico County; *Kenneth Cruze, Montgomery County; William B. Culwell, Carroll County; Henry V. Davis, Cecil County; Melvin B. Davis, Baltimore County; John B. DeHoff, Baltimore City; DeWitt E. DeLawter, Montgomery County; Everett S. Diggs, Council; J. Sheldon Eastland, Council; William Carl Ebeling, Council; Emanuel S. Ellison, Baltimore City; Robert W. Farr, Council; James McC. Finney, Hartford County; Vincent J. Fiocco, Jr., Carroll County; Russell S. Fisher, Council; *William E. Gilmore, Baltimore City; *Wilmer K. Gallager, Jr., Baltimore County; Harold H. Gist, Washington County; William B. Hagan, Council; William G. Helfrich, Baltimore City; Thomas F. Herbert, Howard County; James R. Karns, Baltimore City; Lauriston L. Keown, Baltimore City; Bender B. Kneisley, Past-President; Edward L. J. Krieg, Baltimore County; C. Rodney Layton, Queen Anne's County; Herbert H. Leighton, Garrett County; *Leon R. Levitsky, Prince George's County; Charles H. Ligon, Montgomery County; *James McCarter, Dorchester County; William J. McClafferty, Baltimore City; Karl F. Mech, Council; B. Martin Middleton, Council; Donald W. Mintzer, Baltimore City; Frank K. Morris, Board of Medical Examiners; G. Allen Moulton, Jr., Allegany County; Clayton Norton, Anne Arundel County; Charles F. O'Donnell, Council; Hilary T. O'Herlihy, Anne Arundel County; William A. Pillsbury, Jr., Council; Frank E. Poole, Wicomico County; J. Emmett Queen, Council; Belden R. Reap, Sr., Montgomery County; J. Morris Reese, Council; Guy M. Reeser, Jr., Talbot County; Thomas Reid, Frederick County; Paul F. Richardson, Baltimore City; *James A. Roberts, Montgomery County; Raymond C. V. Robinson, Baltimore City; Donald J. Roop, Council; Edwin Ruzicka, Talbot County; John F. Schaefer, Council; Emmanuel Schimunek, Baltimore City; Thaddeus C. Siwinski, Baltimore County; *Gordon M. Smith, Montgomery County; Aaron C. Sollod, Baltimore City; Omar D. Sprecher, Jr., Washington County; E. L. Suarez-Murias, Baltimore City; *Frank J. Townsend, Jr., Worcester County; Aaron H. Traum, Montgomery County; Thomas E. Van Metre, Jr., Baltimore City; Merton T. Waite, Anne Arundel County; Emerson C. Walden, Baltimore City; Hugh W. Ward, Calvert County; J. Arthur Weinberg, Council; Lawrence R. Wharton, Jr., Baltimore City; Daniel Wilfson, Jr., Baltimore City; Charles H. Williams, Baltimore County; Eldridge H. Wolff, Council; Donald O. Wood, Baltimore County; Charles E. Wright, Frederick County; John D. Young, Jr., Baltimore City; Raymond M. Yow, Council.

Present also for the meeting were staff personnel.

The President made several announcements regarding the transaction of business at the meeting and for information of the delegates.

ELECTION OF OFFICERS

There being no candidates nominated from the floor and there being only one candidate for each of the positions to be filled by unanimous consent the ballot was dispensed with. The following were then elected by voice vote:

President-elect
Arthur G. Siwinski, Baltimore (President-elect 1967-68; President 1968-69)
First Vice-president
Henry A. Briele, Salisbury
Second Vice-president
Wolcott, L. Etienne, College Park
Third Vice-president
George O. Eaton, Baltimore
Secretary
William A. Pillsbury, Timonium
Treasurer
Karl F. Mech, Baltimore
Councilors
John M. Dennis, Baltimore, Central District (1971)
Harry M. Robinson, Jr., Baltimore, Central District (1971)
Donald J. Roop, Baltimore, Central District (1971)
Raymond M. Yow, Salisbury, Eastern District (1971)
J. Parran Jarboe, La Plata, Southern District (1971)
Delegate to American Medical Association
J. Sheldon Eastland, Baltimore (Jan. 1, 1968-Dec. 31, 1970)
Alternate Delegate to American Medical Association
Robert C. Kimberly, Baltimore (Jan. 1, 1968-Dec. 31, 1970)
Committee on Program and Arrangements
John B. De Hoff, Baltimore (1972)
Library and History Committee
Robert B. Goldstein, Baltimore (1973)
Finney Fund Committee
Richard W. TeLinde, Baltimore (1973)

TREASURER'S SUPPLEMENTAL REPORT

Dr. Mech, Faculty Treasurer, was granted permission to announce that an additional sum had been added to the George M. Boyer, MD, Lecture Fund during 1966, and he wished to apprise the House of this fact. He also introduced Mr. Joseph Harrison who acts as Office Manager and Assistant to the Executive Secretary for financial affairs.

INTRODUCTION OF GUESTS

The President introduced J. Everett McClenahan, MD, president of the Pennsylvania Medical Society and Richard E. Flood, MD president of the West Virginia Medical Society.

REFERENCE COMMITTEE REPORT

Dr. Diggs, on behalf of the Reference Committee, reported to the House with respect to Resolution 1A/67, and recommended that it NOT be adopted.

RESOLUTION 1A/67 REJECTED

The House on division vote of 34 in the affirmative and 42 in the negative, rejected Resolution 1A/67, which read as follows:

Whereas, Maryland Medical Service, Incorporated, indicates in its Participating Physicians, Manual, at page 26 (Rev. 2-66) that benefits will be available to its subscribers for diagnostic x-ray services only when such services are performed by physicians conforming to certain criteria established by Maryland Medical Service, Incorporated; and

Whereas, The proper practice of medicine requires the exercise of all of a physician's skills and qualifications; and

Whereas, The condoning of such regulation of medical practice by economic means may lead to further propagation of such restrictions, which are contrary to the best interest of the patient; and

Whereas, Such restrictions are not imposed upon Maryland physicians by licensure; now, therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland condemns any attempt by any insurance company to determine for its subscribers which duly licensed physician is qualified to perform what medical procedure and requests that all insurance carriers doing business in this State amend their regulations accordingly.

RESOLUTION 2A/67 REJECTED

Dr. Diggs, on behalf of the Reference Committee, recommended that Resolution 2A/67 NOT be adopted. The House rejected Resolution 2A/67, which read as follows:

Whereas, The goal of the medical profession, i.e. to obtain the highest possible standard of health and the greatest improvement of medical practice for the public's benefit, may finally be won through enabling the patient to have his own chosen doctor treat him at any institution he chooses (including hospitals), within the state limits; and

Whereas, This type of private practice of medicine is the objective of our Medical and Chirurgical Faculty; and

Whereas, Corporate Private practice of medicine is not permitted in Maryland; and

Whereas, Corporate control, intervention or denial in the private practice of medicine is not in the best interest of or for the benefit of the public's health and welfare; and

Whereas, Our laws regarding the public's health and welfare should be more definitive in this regard; and

Whereas, The medical profession being the only one having intimate and detailed knowledge of the requirements, standards and qualifications of the profession to practice medicine for the public's health and welfare; and

Whereas, The State authorizes only its Board of Medical Examiners in cooperation with the Medical and Chirurgical Faculty and the profession, to qualify, license, regulate and control the practice of medicine throughout Maryland; now, therefore, be it

Resolved, That the Legislature authorize only the State Board of Medical Examiners to be so constituted as to enable it to thoroughly accomplish its purpose and fully assume its sole activity and responsibility, and thereto enact the following:

"There shall be a Maryland State Board of Medical Examiners composed of at least eight (8) active members and it shall have such powers, duties, officers and meetings as are provided from time to time by law. This Board shall be so constituted as to qualify and license not only new members of the profession, but also be assisted in determining the qualifications of members in the Specialties by corresponding Specialists in their respective fields, with the advice and approval of the entire profession in the state.

"The Maryland State Board of Medical Examiners shall be elected by a majority vote of the general voting membership of the Medical and Chirurgical Faculty of Maryland and other eligible doctors in good standing in the state, voting by secret ballot through the mail.

"One-fourth of the members of the Board of Medical Examiners shall be nominated one month before the annual election of officers and delegates by the nominating committee of the House of Delegates; and, additional nominations may be made at a corresponding time by physicians in good standing at component society meetings, from the floor. These nominations shall be circulated to the entire general voting membership of the Medical and Chirurgical Faculty and be available to all physicians in good standing in the State; and, election of the members of the Board of Medical Examiners (as well as delegates and other officers) shall be by secret ballot through the mail. The elected Board members shall serve for a term of four years, or until their successors are elected and qualified, beginning on the first day of June following their election, or as provided by law.

"The State Board of Medical Examiners and its Qualifying and Disqualifying Boards shall be so constituted and after due process of consultation, with the advice and assistance of the Medical and Chirurgical Faculty; and, in compliance with parliamentary procedure and statutory laws and medical ethics, shall have the sole and complete authority and responsibility to qualify, disqualify, license, control and regulate the entire Practice of Medicine, Surgery and the Specialties, everywhere and anywhere in the State of Maryland; and, no other bodies, including individuals, hospitals or other corporations, groups, or branches of Government, shall have authority and responsibility to qualify, disqualify, license, control, regulate, deny, interfere with or intervene in the above, directly or indirectly, without specific definitive legislation to that effect, as noted at present relative to the Health Commissioners.

"The state and its components shall not be contractual parties with or give tax supported financial or subsidized aid in any form to any hospital, institution or other corporation, or group participating in medical practice which denies the State Board of Examiners' properly qualified and licensed doctors in good standing, the use of their beds and facilities for their private practice of medicine.

"If financial support or subsidy, including a tax-free status, is granted to such a body; and, it in turn in its contracts with hospitals or other institutions, bodies or groups, permits discrimination against doctors in good standing and refuses them the right to practice on their private patients by denying them access to the beds and facilities; or, requires of the doctors signed applications to abide by the hospital or corporate Bylaws and control of the practice of medicine; state contracts, financial support, subsidy or tax-free status shall be cancelled."

RESOLUTION 3A/67 REJECTED

Dr. Diggs, on behalf of the Reference Committee, recommended that Resolution 3A/67 NOT be adopted. The House rejected Resolution 3A/67 which read as follows:

Whereas, Medicaid extends full benefits to our indigent people in Maryland; and

Whereas, The best care of the growing infant and child can be given by the family physician or pediatrician, who can watch the child in its good and bad days, and develop a personal relationship with the child and the family which will enable him to treat the child better if sickness develops; and

Whereas, It seems that the so-called well baby clinics, which specialize in administering immunizations and observing growth of the normal child, have no more justification and no further part to play although the contributions of these clinics in the past, when indigent mothers had difficulty obtaining services of private physicians, were outstanding; now, therefore, be it

Resolved, That the Medical and Chirurgical Faculty go on record favoring closure of all well baby clinics and transfer of their patients to private physicians.

RESOLUTION 4A/67 TABLED

Dr. Diggs, on behalf of the Reference Committee, recommended that Resolution 4A/67 be adopted. On motion of Dr. Vail Robinson the House voted that Resolution 4A/67 BE LAID ON THE TABLE. It read as follows:

Whereas, The progressive development of individuals and communities requires freedom from infringements against life, liberty and pursuit of happiness; and

Whereas, To assure freedom from such infringements, governments and governing bodies, with the consent of the governed, properly enact laws, rules and regulations; and

Whereas, Disrespect to law and order, and disobedience of properly enacted laws, rules and regulations leads to demoralization of individuals and deterioration of civilized communities; now, therefore be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland hereby reaffirms its wholehearted support of all properly enacted laws, rules and regulations, and encourages its members to respect and obey them, demonstrating to their fellow-citizens, particularly the youthful, an example of obedience to the letter and spirit of the laws of the land; and be it further

Resolved, That the members of the Medical and Chirurgical Faculty of the State of Maryland, individually and collectively, hereby state, that whenever any law, rule or regulation comes to their attention as being probably improper or probably not conducive to the progressive development of citizens or communities, it is their intent to bring about correction of such impropriety through the democratic processes which represent the proud heritage of American citizens, but to obey such directives until they are properly changed.

RESOLUTION 5A/67 ADOPTED AS AMENDED

Dr. Diggs, on behalf of the Reference Committee, recommended that Resolution 5A/67 be adopted as altered by the Committee with the consent of the sponsor. The House, after debate and further amendment, adopted Resolution 5A/67, as follows:

Whereas, The Medical and Chirurgical Faculty of the State of Maryland has shown, its deep continuing concern with the maintenance of high standards of medical practice, thus ensuring public confidence in the medical profession; and therefore be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland take the initiative and reiterate again the Faculty's offer of assistance to the State Health Department in the maintenance of high standards of medical parctice in the provision of medical services through Maryland's Title 19 program of medical assistance.

TITLE 19 RESOLUTION

Dr. Mech was granted leave by a 2/3 vote under Article VI, Section 4, of the Bylaws to introduce the following motion which was unanimously adopted by the House:

That a telegram be despatched today to the Governor of Maryland, affirming physician support of the Title 19 Medical Care Program, but expressing grave concern over apparent inadequate budget appropriations for successful and complete operation of Title 19 Program. And that copies be sent to the Senate President and House Speaker.

RECOGNITION OF MR. WALTER N. KIRKMAN

Dr. Mech then requested recognition by the House that Mr. Walter N. Kirkman was not able to be present at this session, the first one missed by him in many years, because of illness. The House recognized this and expressed its concern over the illness.

ADJOURNMENT

There being no further business, the President made several announcements, following which he introduced to the House of Delegates the new President, Richard D. Bauer, MD, who assumed the Chair.

After comments and acceptance remarks, the new President by unanimous consent declared the House adjourned *sine die,* at 3:00 PM.

WILLIAM A. PILLSBURY, MD, Secretary

REPORTS

To The House of Delegates

April, 1967

All recommendations in **bold type.**

COUNCIL

Mr. President and Members of the House of Delegates:

Both the Council and the Executive Committee met in lengthy sessions on a regular basis during the past year. All of these meetings were summarized in the *Maryland State Medical Journal* for the information of all members.

Physicians' Defense was ratified for some 33 cases during the past year. There is a continued rise in the number of physicians being sued and more and more of these suits are resulting in substantial verdicts or settlements. To cope with this, an Ad Hoc Committee is being formed to prepare an educational program for Faculty members.

The Council received funds from the publishers of books of Henry P. Laughlin, MD, as well as, an additional sum of $1,500 from M. McKendree Boyer, MD, to be added to the George M. Boyer, MD Lecture Fund.

The Council highlights for the year included:

1. Continued meetings with the Executive Committee of the Hospital Council for discussion of mutual problems.
2. Made certain recommendations to the Governor for various appointments to boards, commissions, councils, and agencies.
3. Designated representatives to an Arbitration Committee for the Edward W. McCready Memorial Hospital, Crisfield, Md.
4. Received a portrait of the late Edgar B. Friedenwald, MD, from his son.
5. Spent many hours hearing charges against Leonard Flax, MD, and reached a decision on the matter which has been appealed to the Judicial Council of the AMA.
6. Discussed various provisions of the Title 19 program with health department representatives; and also with The Johns Hopkins Hospital representatives.
7. Discussed, approved, and considered various recommendations from committees.

Emeritus membership is recommended for the following:

Philip J. Hirshman, MD, Washington County

Respectfully submitted,
Russell S. Fisher, MD, Chairman

SECRETARY

Mr. President and Members of the House of Delegates:

During the past year, the steady increase in the amount of correspondence handled has continued. In addition, the Faculty now handles the dues billing for all component societies, remitting to them the dues collected on their behalf. Dues of the AMA are also remitted to Chicago. Membership in the AMA totalled 2,434 for the year 1966.

During the past year, staffing was provided for all committee and subcommittee meetings. Minutes were written for these sessions, and sent out together with meeting notices and other material. Complete records of all these meetings are available at the Faculty office and provide continuity and background for new chairmen as they take office. In 1966 a total of 415 meetings was held in the Faculty building, in addition to the regular medical examinations held by the Board of Medical Examiners.

Respectfully submitted,
William A. Pillsbury, MD

EXECUTIVE SECRETARY

Mr. President and Members of the House of Delegates:

The work results of the office staff are reflected in the various committee reports, as well as the smooth functioning of the office tasks.

Hopefully, all inquiries received are answered promptly, courteously, and with complete information. It is assumed that this occurs, as nothing to the contrary has been reported to me.

Several employee changes took place during the year. This has resulted in additional work loads for some of our staff. In addition, the tremendous changes that are taking place in medicine today have forced additional duties and responsibilities on us.

Additional calls for attendance at meetings, both intra- and inter-professional, have placed an unduly heavy load on time.

In closing, I may state that I look forward to many more years of happy association with the Faculty; and also express appreciation to the devoted and loyal staff members who make my work that much easier.

Respectfully submitted.
John Sargeant

AMERICAN MEDICAL ASSOCIATION EDUCATION AND RESEARCH FOUNDATION COMMITTEE

Mr. President and Members of the House of Delegates:

In 1966, Maryland physicians gave $9,510.00 to medical education through the AMA-ERF. A check was formally presented at the AMA clinical meeting in Las Vegas by Russell S. Fisher, MD, Maryland delegate to the AMA.

From the national total collected in 1966, the University of Maryland School of Medicine receives $15,678.69 and The Johns Hopkins University School of Medicine receives $9,517.64. As has been the custom, the checks will be presented to the deans of the respective medical schools at the Presidential Dinner.

Respectfully submitted,
William S. Stone, MD, Chairman
Newland E. Day, MD
Abraham Genecin, MD
William B. Gunther, MD
Bender B. Kneisley, MD
J. Douglass Shepperd, MD
Vernon M. Smith, MD
Thomas B. Turner, MD

BOARD OF MEDICAL EXAMINERS

Mr. President and Members of the House of Delegates:

Examinations given during the year show the following results:

Applications received for examination		625
Second year students examined	116	
Postponed, withdrawn or did not appear	89	
Failed to complete	2	
Re-examined after license to meet requirements of other states	1	
Not eligible for license		208
Examined in second part of exam	114	
Complete examination	193	
Re-examined	110	
Eligible for license		417
Passed—American Graduates	145	
Passed—Foreign Graduates	168	
Failed—American Graduates	11	
Failed—Foreign Graduates	93	417
The American schools which had failures are as follows:		
Howard Univ.	5	
Johns Hopkins	3	
Univ. of Maryland	1	
Stritch Medical School	1	
Univ. of Washington	1	
Licenses issued after examination	417	
Licenses issued by endorsement of other states' licenses	163	
Licenses issued by endorsement of National Board Certificate	244	
Total licenses issued	824	
Licenses revoked or suspended	0	
License restored	1	
Licentiates certified to other states	263	
Copies of licenses issued	29	
American graduates examined and re-examined	150	
Foreign graduates examined and re-examined	267	
Foreign graduates approved for examination	169	
Written inquiries from foreign graduates (approx.)	584	
Office interviews with foreign graduates (approx.)	275	
Telephone inquiries from foreign graduates (approx.)	1,600	
Telephone inquiries concerning registration of physicians	2,500	
Written inquiries concerning registration of physicians (approx.)	500	
6/1/63-6/1/66 Registration certificates issued to 5/30/66	11,084	
1966-69 Registration certificates issued to 12/31/66	8,380	

Hearings

Ulysses G. Bourne, MD, was charged with having violated Federal Law by selling pep pills. After considering the testimony, the Board decided to take no further action, and considered the case closed.

The license of Bennett A. Robin, MD, was revoked in 1965. He appealed, and the appeal was withdrawn on May 1, 1966. His Maryland medical license was restored on August 1, 1966.

Reprimanded

Ralph F. Young, MD, was notified that the Board of Medical Examiners of Maryland have relieved him of further responsibility to the Board in connection with the hearing on revocation and the case is now closed.

Carlos Arrabal, MD, was reprimanded for dispensing drugs illegally on which charges he was placed on probation without verdict. He has been reprimanded by this Board and is reporting periodically to the Executive Committee at three month intervals to give an account of his professional activities and moral character.

Yuen K. Yuan, MD, is still reporting to the Executive Committee to give an account of his professional activities.

John Richard Smith, MD, was notified that he would no longer be required to report to the Executive Committee to give an account of his professional activities.

Rent

As noted in the Summary of Activities January 1, 1966 to March 1, 1966, the rent for Osler Hall was increased from $80.00 to $125.00 beginning January 1, 1967.

Senate Bill 143 was passed empowering the Board of Medical Examiners of Maryland to provide for suspension or placing physicians on probation.

Sixty-Second Annual Congress of Medical Education and Licensure

Doctors Walter C. Merkel, Vernon H. Norwood, and Frank K. Morris representing the Board attended the Congress held in Chicago February 5 to 8, 1966.

Notification of Hearing

The Medical and Chirurgical Faculty will be notified of the date of hearing for restoration of a Maryland medical license.

Third Triennial Registration

The third Triennial Registration began June 1, 1966, known as the "C" registration.

Respectfully submitted,

FRANK K. MORRIS, MD, Secretary
JOHN H. HORNBAKER, MD
KARL F. MECH, MD
WALTER C. MERKEL, MD
WILBER R. ELLIS, JR., MD
VERNON H. NORWOOD, MD
ELMER G. LINHARDT, MD
WILLIAM L. STEWART, MD

BYLAWS COMMITTEE

Mr. President and Members of the House of Delegates:

The Bylaws Committee has had one meeting to consider Bylaws changes. These are presented herewith for action by the House of Delegates:

Amend Article I, Section 1, by adding: "Membership in a component society shall carry with it membership in the appropriate class of membership in the Faculty."

OLD

Section 1. All medical societies of the Maryland counties and Baltimore City chartered by the Faculty shall constitute the component societies of the Faculty.

NEW

(CAPS portion to be added)

Section 1. All medical societies of the Maryland counties and Baltimore City chartered by the Faculty shall constitute the component societies of the Faculty. MEMBERSHIP IN A COMPONENT SOCIETY SHALL CARRY WITH IT MEMBERSHIP IN THE APPROPRIATE CLASS OF MEMBERSHIP IN THE FACULTY.

Explanation: Because this question of compulsory membership in the Faculty is being raised continually, and despite various legal and parliamentary rulings on it, it is felt that this should be in the Bylaws so as to ensure there is no misunderstanding on this point.

Amend Article II, Section 4, by striking out the word "active" before the word "members."

OLD

(*Italicized portions to be deleted*)

Section 4. EMERITUS MEMBERS shall consist of those *active* members who, upon the request of their component societies and recommendation by the Council, shall be so designated by majority vote of the House of Delegates. They shall be (1) members no longer engaged in the practice of medicine, either in private practice, public health, administration, teaching or any other activity where their knowledge of medicine earns them an income; or (2) members whose health is such that their ability to carry on active practice has become greatly limited. They shall have the rights accruing to associate members. They shall not be entitled to physicians' defense unless the alleged malpractice occurred during their tenure as active members.

NEW

Section 4. EMERITUS MEMBERS shall consist of those members who, upon the request of their component societies and recommendation by the Council, shall be so designated by majority vote of the House of Delegates. They shall be (1) members no longer engaged in the practice of medicine, either in private practice, public health, administration, teaching or any other activity where their knowledge of medicine earns them an income; or (2) members whose health is such that their ability to carry on active practice has become greatly limited. They shall have the rights accruing to associate members. They shall not be entitled to physicians' defense unless the alleged malpractice occurred during their tenure as active members.

Explanation: No provision exists for making Associate Members Emeritus Members of the Faculty. This amendment will provide for this.

Amend Article III, Section 4, by striking out the second sentence and inserting: "Any member whose dues are unpaid by March 1 each year shall be deemed to be not in good standing and shall forfeit all rights in the Faculty and its components, and shall not be reinstated until after the Annual Meeting and all arrearages are paid. If the member's dues are not paid up by December 31 of that year he shall be dropped from the roll of members."

OLD

(*Italicized portions to be deleted*)

Section 4. Any component society failing to comply with Section 1 of this Article by March 1 each year may be suspended and forfeit all rights in the Faculty. *Any member whose dues are unpaid by March 1 each year shall be deemed suspended and forfeit all rights in the Faculty and shall not be reinstated until after the Annual Meeting and all arrearages are paid.*

NEW

(CAPS portion to be added)

Section 4. Any component society failing to comply with Section 1 of this Article by March 1 each year may be suspended and forfeit all rights in the Faculty. ANY MEMBER WHOSE DUES ARE UNPAID BY MARCH 1 EACH YEAR SHALL BE DEEMED TO BE NOT IN GOOD STANDING AND SHALL FORFEIT ALL RIGHTS IN THE FACULTY AND ITS COMPONENTS, AND SHALL NOT BE REINSTATED UNTIL AFTER THE ANNUAL MEETING AND ALL ARREARAGES ARE PAID. IF THE MEMBER'S DUES ARE NOT PAID BY DECEMBER 31 OF THAT YEAR HE SHALL BE DROPPED FROM THE ROLL OF MEMBERS.

Explanation: Again, the current procedure is as outlined in the new, proposed Bylaws. Because it should be clearly spelled out as to what rights and benefits a member has; and because it should be clear to the staff as to what procedure is to be followed, this amendment is proposed for adoption.

Amend Article VII, Section 2, Clause 9, by substituting for it the following: "Appoint an Editor of the *Maryland State Medical Journal* for a term of three years or until his successor is appointed."

OLD

(*Italicized portions to be deleted*)

Section 2. . . . (9) appoint an Editor and Business Manager of the Maryland State Medical Journal;

NEW

(CAPS portion to be added)

SECTION 2. . . . (9) APPOINT AN EDITOR OF THE *MARYLAND STATE MEDICAL JOURNAL* FOR A TERM OF THREE YEARS OR UNTIL HIS SUCCESSOR IS APPOINTED.

Explanation: Because the functions of the Business Manager are carried out by the accounting department of the Faculty; and because all Faculty appointments to offices carry a term with them, the Bylaws Committee recommends adoption of this amendment.

Amend Article XII, Section 2, by striking out "After consideration of the merits of the case,".

OLD (*Italicized portions to be deleted*)	*NEW*
Section 2. *After consideration of the merits of the case,* on a majority vote, the Council may authorize physicians' defense and the matter shall be referred to an attorney-at-law retained by the Council for a term of one year.	Section 2. On a majority vote, the Council may authorize physicians' defense and the matter shall be referred to an attorney-at-law retained by the Council for a term of one year.

Explanation: Because the Council is not in the position of making an adequate judgment of "the merits of the case," and because the current procedure followed does not, in fact, do this, the Bylaws Committee recommends the adoption of this amendment to bring the Bylaws into accord with the procedure followed.

Respectfully submitted,
Charles F. O'Donnell, MD, Chairman
Edmond J. McDonnell, MD
B. O. Thomas, Jr., MD
Raymond M. Yow, MD

CONTRACTUAL ARRANGEMENTS COMMITTEE

Mr. President and Members of the House of Delegates:

The Committee on Contracutal Arrangements has held only two formal meetings since it was organized in early 1966. One was for the purpose of surveying the various specialty groups and ascertaining the problems, if any, within those groups.

The other meeting was held to report to committee members progress being made in the elimination of payment for professional services from the Blue Cross contract and transfer of such payment to the Blue Shield contract. Several meetings were held with the Faculty's committee chairman acting as a catalyst in bringing together all interested parties to discuss this problem. Representatives of the Hospital Council, Blue Cross, Blue Shield, Pathologists, Radiologists, and others were all in attendance.

These meetings proved fruitful and, at this time, we believe served a useful purpose. It is hoped that the end result will be a satisfactory solution of this entire matter.

Respectfully submitted,
Belden R. Reap, MD, LLB, Chairman
Robert Z. Berry, MD
Stanley J. Bociek, MD
Donald H. Dembo, MD
Leonard J. Gallant, MD
Paul F. Guerin, MD
Theodore Kardash, MD
John G. Lyons, MD
Elliott Michelson, MD
William A. Niermann, MD
William B. Settle, MD
Albert Shapiro, MD
Charles E. Silberstein, MD
Henry H. Startzman, Jr., MD
Henry B. Wilson, MD

CURATOR

Mr. President and Members of the House of Delegates:

In accordance with a long-standing resolution of the House of Delegates, additional portrait restoration took place during the past year. The sum of $500.00 is budgeted on an annual basis for this purpose. Eventually, the Faculty's collection of portraits will be in first-class condition.

Several items of interest have been added to the Faculty's collection during 1966. Among these are additional gifts of material on the Laurel Sanitarium and a photograph of the graduating class, as well as a certificate and diploma, of the late Jesse C. Coggins, MD, presented by Mrs. Coggins, to whom we again express our appreciation. A portrait of Edgar B. Friedenwald, MD, was received from his son, Lt. Col. Aaron Friedenwald. Mrs. J. Mason Hundley, Jr., presented the Faculty with one of her late husband's "prized possessions"—an autographed photograph of Marion Sims, MD, and the book, "The Story of My Life" by Dr. Sims.

At the suggestion of Henry V. Chase, MD, Mrs. Mary Ann Sappington and Mrs. L. J. Call, Jr., presented the Faculty with a reproduction of a portrait of Francis Brown Sappington, MD, one of the founders of Med-Chi.

Several reprints of articles written by William J. Todd, MD, were received from his daughter, Mrs. Richard B. Webb and a gift of old instruments, etc., belonging to William Kelso White, MD, was donated by Mrs. White.

We wish to thank those members and non-members for their kindness in donating material of historical importance to our collection of memorabilia.

The Heart Association of Maryland had an attractive window display during the Flower Mart in Baltimore City this past year. The theme of the Mart was "Historic Baltimore" and much interest was created by the stethoscopes, lottery tickets, large medicine chest, case of instruments, gas lantern used in X-ray dark room, and an apothecary cabinet borrowed from the Faculty.

A medicine chest, saddle bags with medicine and a turnkey were borrowed by the Baltimore City Health Department for use to create a set—a doctor's office in the 1800's—for display on one of the TV shows of "Your Family Doctor."

Mrs. Elmer G. Linhardt borrowed the Dennis Claude diploma, Ehrich's Self Retaining Speculum, and a syringe owned by Upton Scott, MD, one of the Faculty founders, for an exhibit which she arranged at the American Society of Abdominal Surgeons in Chicago.

Respectfully submitted,
E. David Weinberg, MD, Curator

DELEGATES TO THE AMERICAN MEDICAL ASSOCIATION

Mr. President and Members of the House of Delegates:

Your three Delegates and the Senior Alternate Delegate to the American Medical Association's House of Delegates attended the 1966 Clinical Session held in Las Vegas from November 27-30, 1966, at which many items of interest were discussed. The following information is reported to the House for its information. Individual items have been referred to the appropriate Faculty Committees and Subcommittees for whatever action is deemed fit by them.

Education for family practice, billing and certification procedures under Public Law 89-97, proposed revisions of the Selective Service System, payments for professional services, compensation for house officers, and use of the terms "ethical" and "unethical" were among the major subjects acted upon by the House of Delegates at the American Medical Association's 20th Clinical Convention held November 27-30 in Las Vegas, Nevada.

Dr. Charles L. Hudson, AMA President, told the Monday opening session of the House that the need to improve existing services and establish new services for the total population should be a "top priority" of the medical profession. He proposed that the AMA and the state and county medical societies launch a continuing program, under predominantly private auspices, for all persons of whatever age, race, creed, or color, and he emphasized that it is "among the needy and formerly indigent that I feel we must show interest, initiative, and enterprise."

At the Wednesday session Dr. Robert Mayo Tenery of Waxahachie, Texas, general surgeon and past president of the Texas Medical Association, was elected to fill the unexpired term of the late Dr. William A. Hyland, ending June, 1969, on the Council on Constitution and Bylaws.

Final registration reached a grand total of 11,226, which was a record high for an AMA Clinical Convention, and that included 4,574 physicians, which was the third highest physician registration at a Clinical Convention.

Education for Family Practice

Calling it "a document of major importance on a subject of vital significance to the health care of the American public," the House of Delegates endorsed the recommendations of the Ad Hoc Committee on Education for Family Practice and authorized the Council on Medical Education to develop and initiate plans for their implementation. The long report contained the following recommendations:

"A. Major efforts should be instituted promptly to encourage the development of new programs for the education of large numbers of family physicians for the future, as described in the body of this report. The educational programs should relate to all levels of medical education, including premedical preparation, medical school education, internship and residency training, and continuing medical education. Keynotes should be excellence comparable to programs in other specialties and flexibility to permit the design of programs which will meet the needs and interests of individual physicians.

"B. Medical schools and teaching hospitals should be urged to explore the possibility of developing models of family practice, in cooperation with the practicing profession.

"C. New sources of financial assistance should be developed for the support of family practice teaching programs. Substantial funds should be made available for all aspects of the programs, including the conduct of the educational program, the recruitment and training of full-time faculty, the development of facilities and models of family practice, and the conduct of research in patient care and community medicine.

"D. Recognition and status equivalent to other medical specialties should be given to family practice. An appropriate system of specialty certification should be provided for those who have completed approved educational programs and have demonstrated their competence as family physicians. The graduate program (i.e., internship-residency program) should be an integrated whole, evaluated for accreditation by one body rather than two.

"E. Careful attention should be given to other factors which should make the environment for family practice more favorable and serve as incentives to medical students and young physicians to enter this field.

"F. Careful study should be made of the effect of premedical programs and the admission procedures, curricula and student evaluation policies of medical schools upon the production of family physicians."

Delegates and other interested AMA members also attended an open hearing Tuesday morning on the report of the Citizens Commission on Graduate Medical Education, which is similar in many respects to the report of the Ad Hoc Committee on Education for Family Practice. The Commission report is still under study by the AMA Board of Trustees and Council on Medical Education. The House of Delegates urged every physician and medical society to study the report (commonly called the "Millis Report"), to evaluate it, and to present comments and critique to the Board prior to the next session of the House.

Public Law 89-97

The House adopted a resolution urging that the American Medical Association advise the Department of Health, Education, and Welfare that the present requirements for certification and recertification have proven highly objectionable, unnecessary, and do not contribute to the quality of medical care.

It also recommended that the American Medical Association endeavor to bring about repeal of those portions of PL 89-97 in which the requirement for physician certification of medical necessity appears.

The resolution concluded by suggesting that the fiscal intermediaries and the American Hospital Association be advised that AMA will be available to assist in the development of appropriate amendments to this legislation. The purpose of this consultation would be to discuss the complexities of the present requirement and to invite participation in the development of amendments to the law which will be professionally acceptable and administratively workable.

The House also adopted a resolution declaring that the AMA strongly support amendment of the Social Security Act, including Title XIX, to permit payments without assignments for medical care of the patient.

The House rejected three resolutions and one report defining usual, customary, and reasonable charges. Instead, it adopted a resolution which said that the definitions of the words "usual," "customary," and "reasonable" be considered, within the fundamental framework of individual determination, the responsibility of the constituent state medical societies, with the understanding that the advice and counsel of the AMA be made available to those states requesting such assistance.

Selective Service Proposals

The House adopted a report seeking federal legislation to establish a National Commission on Health Resources and Medical Manpower. The commission would revise the "doctor draft" system and establish physician alloca-

tion priorities to maintain a proper balance of health personnel in civilian and government service.

The report, prepared by the Council on National Security, cited three basic flaws in the Selective Service System as it pertains to the selection of physicians for military service: 1) There is no medical group directing the allocation of physicians; 2) There is no medical group directing the priorities to be used for calling physicians to active duty; 3) There is a need for a stronger medical voice within the Department of Defense.

The proposed commission would be appointed by the President with consent of the Senate. It would replace the Health Resources Advisory Committee and the National Advisory Committee to Selective Service.

Prescribing of Drugs

The House adopted a report by the Board of Trustees reaffirming the position of the AMA regarding the prescribing of drugs. The report states:

"The present policy of the American Medical Association is that physicians should be free to prescribe drugs generically or by brand name for *all* of their patients, whether they are paying, Medicare, or indigent patients—the primary consideration being the best interests of the patient. Medical considerations must be paramount in the selection of drugs. In addition, the physician also has an obligation to be mindful of the economic consequences of the treatment he prescribes."

Choice of a Laboratory

The House adopted a report of the Judicial Council which answered questions which have been raised about laboratory services. The report stated:

"Medical considerations, not cost, must be paramount when the physician chooses a laboratory. The physician who disregards quality as the primary criterion or who chooses a laboratory because it provides him with low cost laboratory services on which he charges the patient a profit, is derelict in not acting in the best interests of his patient. However, if reliable quality laboratory services are available at lower cost, the *patient* should have the benefit of the savings."

Statement on Chiropractic

On recommendation of the Board of Trustees, the House adopted a policy statement submitted by the Committee on Quackery. The statement notes "the position of the medical profession that chiropractic is an unscientific cult whose practitioners lack the necessary training and background to diagnose and treat human disease" and pointed out that "decisions by the nation's highest courts [justify] the medical profession's educational program of alerting the nation to the public health threat posed by the cult of chiropractic."

Statement on Alcoholism

The House reaffirmed the 1956 policy statement on admission of alcoholics to general hospitals. The statement urged hospital administrators and medical staffs to look upon alcoholism as a medical problem and to admit patients who are alcoholics to their hospitals for treatment, with such admissions being made after due examination, investigation, and consideration of the individual patient. The House, in Las Vegas, recommended more adequate implementation of the 1956 statement and urged that "insurance companies and prepayment plans be encouraged to remove unrealistic limitations on the extent of coverage afforded for the treatment of alcoholism."

Payments for Professional Services

To clarify AMA policies as they now exist, the House adopted the following eight-point statement regarding payment for professional medical services:

"1. It is proper for the physician to establish the fee which he charges to any patient for the professional service rendered, with recognition of the fact that a duly constituted committee of his peers may appropriately review and pass upon the equity and justice of his charge.

"2. It is proper for third party agencies to make payment of professional medical fees in behalf of patients, with recognition of the fact that the service of the physician has been to the patient and the liability for payment rests primarily with the patient or his family.

"3. It is proper for a physician to work cooperatively with other physicians in a team approach to the provision of medical service, with recognition of the fact that each cooperating physician is entitled to compensation according to the value of his services, and that the charges attributable to each physician's service shall be made clearly known to the patient.

"4. It is proper for a physician who provides personal supervision and direction for a physician-in-training to charge for the professional medical service rendered.

"5. A physician should not enter into a contract or agreement with a hospital whereby the hospital acts as the agent for a physician unless it is with the consent of the physician and of the medical staff. The physician and the medical staff, as principals, should not approve any contract whose terms or conditions are inconsistent with the Principles of Medical Ethics and established policy of the American Medical Association.

"6. Physicians, collectively in hospitals, may properly establish special medical staff funds, wholly under their own control, which they may support as they see fit and disburse as they may agree.

"7. Fees for professional medical services are properly paid only to the responsible physicians and may not be appropriated by any other person or agency.

"8. The physician is the sole arbiter as to the ways in which he may dispose of his professional income, without duress, consistent with the laws of the land and the Principles of Medical Ethics of this Association."

Compensation for House Officers

The House approved the first four sections of a joint report by the Council on Medical Education and Council on Medical Service. Those sections provided new guidelines on the utilization of private patients in teaching programs; recommended principles to govern the assignment of professional responsibility of house officers for the care of paying patients; presented interpretations of the 1961 statements by the House concerning remuneration of house officers and the increasing responsibility of the medical profession for the development of appropriate methods of financial support for interns and residents, and recommended a statement to guide medical staffs in the development of additional funds to supplement, if necessary, those from hospital sources.

The House then modified or added the final four sections as follows:

E. The presently published provisions for payment under Part A, Title 18, Public Law 89-97 for services rendered to beneficiaries by interns and residents, and under Part B, Title 18, Public Law 89-97 for services rendered by attending physicians supervising interns and residents, are compatible with the organization and administration of programs of graduate medical education according to the standards of the American Medical Association. The principles embodied in these provisions should uniformly apply to regulations governing all other third party medical care plans.

F. It is recommended that sources and amount of compensation for house officers should be determined by local agreement and implemented in accordance with state laws and the ethical principles and policy positions of the American Medical Association.

G. The above principles should be widely publicized so that they may be understood and implemented in good faith by all concerned.

H. The broad and complex nature of the problems in the financial areas is recognized, and continued studies and reports thereon by the Council on Medical Service are encouraged. These should include staff compensation, methods of fund collection, control and disposition, and other pertinent and related matters.

Use of the Terms "Ethical" and "Unethical"

The Judicial Council, which had been asked to comment on use of the terms "ethical" and "unethical," submitted the following report which was adopted by the House:

"Historically, the term 'ethical' has been used in opinions and reports of the Judicial Council and in resolutions adopted by the House of Delegates to refer to matters involving (1) moral principles or practices; (2) customs and usages of the medical profession; and (3) matters of policy not necessarily involving issues of morality in the practice of medicine. The term 'unethical' has been used to refer to conduct which fails to conform to these professional standards, customs, and usages, or policies, as interpreted by the American Medical Association.

"Unethical conduct involving *moral principles,* values and duties calls for disciplinary action such as censure, suspension, or expulsion from medical society membership.

"Failure to conform to the *customs and usages* of the medical profession may call for disciplinary action depending upon the particular circumstances involved, local attitudes, and how the conduct in question may reflect upon the dignity of and respect for the medical profession.

"In matters strictly of a policy nature, a physician who disagrees with the position of the American Medical Association is entitled to freedom and protection in his point of view."

Other Actions

In considering 63 resolutions, 22 Board reports and a wide variety of additional reports and materials from councils and committees, the House of Delegates also:

Approved establishment of a new *Committee on Continuing Medical Education* but also urged that lines of authority be clearly defined by the Board of Trustees in consultation with the Council on Medical Education in order to avoid duplication of responsibilities already assigned to the Council;

Instructed AMA members of the Joint Commission on Accreditation of Hospitals to express grave concern regarding the accreditation of hospitals in which *laboratories* are directed by non-physicians or physicians not adequately qualified in laboratory medicine;

Passed two resolutions opposing the *"dual fee"* practice of determining the rate of payment for a physician's services solely on the basis of his type of practice;

Approved a Board report recommending that *Social Security* laws be amended so that physicians entering the program for the first time may obtain earlier eligibility and improved benefits;

Recognized the increasing importance of *medical society review committees,* reaffirmed the guidelines published in the November 29, 1965, issue of JAMA and endorsed additional principles recommended by the Council on Medical Service;

Urged continuing, vigorous effort to dissuade local officials from demanding that physicians sign civil rights *compliance statements* that are not required by law or by federal directives;

Recommended that state medical societies seek the passage of state legislation which would provide a physician who serves on a *utilization review committee immunity* from litigation arising from the activities of such committees;

Asked that the Board of Trustees direct the Council on Legislative Activities to continue to pursue with committees of Congress the need for amending the *Self-Employed Individuals Tax Act* to provide self-employed individuals with opportunities for deferring current earnings and taxes comparable to opportunities presently enjoyed by employed individuals;

Requested the Bureau of the Budget to modify the cost accounting system of *Veterans' Hospitals* to permit comparison with cost accounting in community hospitals to the end that economy, efficiency, and patient care can be properly assessed in Veterans' Hospitals;

Reaffirmed its support of the principle that every ethical licensed doctor of medicine who needs and desires them should have *staff privileges,* commensurate with his training and skill, in at least one accredited community hospital;

Recommended that each *hospital* should have at least one voting doctor of medicine member on its *Governing Board* who, preferably, should either be appointed or elected by the hospital medical staff from its membership;

Pointed out that there is a definite need for utilization committees and declared that *tax supported hospitals* and private hospitals should be governed by the same utilization standards;

Approved Board recommendations that "the AMA support the need for a significant improvement in the income of the *registered nurse*" and that "the AMA continue to support in principle all current nationally approved educational programs for nurses";

Agreed with the Board that the Council on Postgraduate Programs be renamed as the *Council on Scientific Assembly* and that its functions be redefined to enable concentration on AMA scientific meetings;

Adopted a resolution that the AMA take measures to insure the attention of medical societies to the need for appropriate utilization of *retired physicians and inactive nurses;*

Passed a resolution on the determination of *elderly applicants'* eligibility for automobile liability insurance and driver licensure which said that "although physicians are willing to examine applicants and determine whether or not the applicant meets specified physical standards for automobile liability insurance or for licenses to operate motor vehicles, the determination of what standards should be required or whether the driver is insurable and should be licensed to drive is the responsibility of the insurance companies concerned and of the state agencies issuing licenses, respectively";

Rescinded Resolution 104 which had been adopted by the House in June, 1966;

Endorsed the principle of *free choice* of physician and medical facility under Title XIX of Public Law 89-97;

Urged that the AMA continue to promote constructive legislation improving *existing governmental health plans* and continue to offer constructive advice;

Authorized the Board of Trustees to continue the *AMA Members Disability Program* beyond August 31, 1967; make every effort to continue the program with the same premium-benefit structure; clarify the existing program, and, if necessary, renegotiate a revised program which will be financially sound and will provide the best possible benefits and protection for present and future participants;

Approved a Board recommendation that no special section of *The AMA NEWS* be set aside for county society communications, but that news of county society activities continue to be an important part of *The AMA NEWS;*

Agreed with the Board that, effective January 1, 1967, the AMA should discontinue paying for the rental of the *TWX equipment* in state medical society offices;

Recommended that *driver education* should be an integral part of the secondary school curriculum and be offered to all students;

Approved a Council on Medical Service report providing guidelines for collaboration of physician, social worker, and lawyer in helping the *unmarried mother* and her child, and;

Referred to the Board, for consideration and appropriate implementation, a resolution urging the AMA to expand its programs and studies in the field of *crime prevention.*

Awards and Presentations

At the Monday opening session Dr. Milford O. Rouse, AMA president-elect and former speaker of the House, was presented with a mounted gavel in appreciation of his many years of service to the House and the Association.

Contributions totaling more than $500,000 were presented on Monday to the American Medical Association Education and Research Foundation. They were as follows: Merck Sharp and Dohme, $100,000; California Medical Association, $207,985; Illinois State Medical Society, $185,000; Utah Medical Association, $12,957.50; Medical and Chirurgical Faculty of Maryland, $9,110, and American Urological Association, $1,000.

Glen W. Geelhoed of Ann Arbor, a medical student at the University of Michigan, was announced on Tuesday as first-place winner in the Norman A. Welch, MD, Medical Ethics Essay Contest sponsored by the AMA Judicial Council. At the same session the delegates heard an address by Dr. Malcom E. Phelps, field director of the AMA Volunteer Physicians for Vietnam, who said that the American physician is making a "tremendous impression" on the South Vietnamese people.

Respectfully submitted,
Robert vanL. Campbell, MD
J. Sheldon Eastland, MD
Russell S. Fisher, MD
William B. Hagan, MD, Senior Alternate

ECONOMICS COMMITTEE

Mr. President and Members of the House of Delegates:

The Health Insurance Review Subcommittee of the Economics Committee met four times during the year and heard fourteen new cases of fee disagreement between major medical insurance carriers; eight reviews of settled cases; and two complaints registered by physicians against insurance carriers.

It was decided at the first session of the Subcommittee in the new year that as new inquiries are received at the Faculty office, surgical cases will be referred to a surgical member and medical cases to a medical member for advice. This information is then circulated to other members of the Subcommittee for comments with consensus transmitted to the insurance carrier.

It was also agreed, inasmuch as there are no psychiatrists on the Subcommittee, that in future cases involving psychiatric treatment, Jonas R. Rappeport, MD, would be asked to join the meeting for consultation.

As a result of study of a summary of cases handled by this Subcommittee since 1963, it was decided that representatives of the Health Insurance Council should be invited to a future meeting, along with representatives of the Maryland Medical Service, to discuss procedures used by carriers in arriving at their conclusions as to proper fees. The group feels that it provides an important service to the insurance industry in acting as arbiter and that in turn, the carriers should be reminded that they have an equal obligation to cooperate with the medical profession by not using harassing tactics.

Since 1963, a total of 31 cases had been handled by this Subcommittee with Aetna Life and Casualty and Maryland Hospital Services, Inc., leading in the number submitted by the eleven carriers. Medical Service of D.C. had the third highest number of cases submitted.

Respectfully submitted,

COMMITTEE ON EMOTIONAL HEALTH

Mr. President and Members of the House of Delegates:

The main areas of interest of the Committee centered on legislation, residency training in general hospital psychiatry, community mental health, and educational programs.

In the field of legislation, success was noted in the passage of the Patient/Psychiatrist Privileged Communication Bill, which was signed by the Governor on the last day bills which had been passed by the 1966 State Legislature could be signed.

On the other hand, the Committee recommended that the statement in the Reportable Disease law up before the 1967 Legislature relating to mental conditions be changed so as to delete the reporting by state mental hospitals of

all admissions and discharges. It was felt this involved a lot of work and would not cut down in any appreciable manner the number of traffic accidents. This statement was deleted from the proposed bill. In relation to this same legislation proposed by the Subcommittee on Traffic Safety (making certain physical and mental conditions reportable by physicians to the Medical Advisory Board of the Department of Motor Vehicles), motions were passed which would also delete the statement "any known, chronic, active alcoholic" since it was felt: (1) this would be medically undefinable; (2) laws already exist relating to this problem; and (3) treatment of such patients would be hindered.

The Committee further recommended that any person adjudicated incompetent be reported to the Department of Motor Vehicles by the Court or attorney, not by a physician, since "this is not a medical decision."

Finally, the Committee urged the Traffic Safety Subcommittee to consider more fully a more specific and definable reportable condition than implied in the phrase, "severe impairment of judgment."

A report was submitted on the training of psychiatric residents in general hospitals with no general agreement as to whether this is properly in the aegis of the Department of Mental Hygiene. It was suggested that in training the personnel at State Hospitals in general hospital psychiatry, the MEDIC system, as well as special visual aids and tape recordings, be used.

The Committee endorsed a proposal that some form of self-administered psychiatric test be made available at the Health Fair to be held at the Civic Center next year. This would be a good means of impressing the public with the need for concern with mental as well as physical health.

Consideration was given to the suggestion from the AMA that regional mental health conferences be held rather than national conferences. After discussion, the opinion was that regional conferences would not provide as much valuable information as national conferences, and therefore, the Committee voted against the suggestion.

No definitive action was taken on the need for transportation to hospitals of the mentally ill. This is, and has been, a constant problem in the state to which no feasible solution has yet been discovered.

The Committee also considered means of encouraging members of the Maryland Psychiatric Association not now members of the Medical and Chirurgical Faculty to join the latter. No action has yet been taken in this area.

No change in the policy of the Board of Medical Examiners for reciprocity licensing of foreign medical students was effected, the present procedure of hearing only special cases in which a doctor has a great deal of training being heard individually remaining in effect.

FEE SCHEDULE COMMITTEE

Mr. President and Members of the House of Delegates:

A great deal of time during the past year has been devoted to the concept of Usual, Customary, and Reasonable Fees to be paid physicians under various governmental programs. This principle is most important and it is hard to make the individuals responsible for such payment realize that physicians and the medical profession have been subsidizing such programs for many years.

After considerable discussion in this area with appropriate officials of state agencies it has been resolved with the Division of Vocational Rehabilitation, State Department of Education. Progress has also been made in the areas of discussions with the Workmen's Compensation Commission, as well as, the State Health Department.

Despite the recommendations of the State Health Department, a figure has been included in the 1968 fiscal budget for the Medical Care program that does not provide sufficient funds for payment on the basis of Usual, Customary, and Reasonable Fees. It is hoped that the funds included can be retained without reduction by the Legislature. Even if this is done, there will, in all probability, be a need for a supplemental State appropriation toward the close of the 1968 fiscal year.

Discussions have also been entered into with the State Health Department in connection with the lateness of payments and the arbitrary actions on the part of the Health Department in rejecting physicians' completed payment forms for medical care cases.

In June, 1966, the Committee requested permission from the Council to renegotiate the Dependents' Medical Care Program contract on the basis of Usual, Customary, and Reasonable Fees. After a meeting with representatives of the U. S. Armed Forces, and an abortive attempt to resolve how this would be administered, the Fee Schedule Committee recommended that this contract not be renegotiated and that Blue Shield be the fiscal intermediary for payment of physicians or patients under this program. This was approved by the Council in March, 1967.

An attempt was made to determine a definition of the term "reasonable," and this is still under study in the Committee.

During the year, various fees have been amended to conform with changing conditions. Additions and deletions to the Fee Guide have also been made. The most pressing objective of the Committee, at this time, however, is the principle that has been established by the House of Delegates. This is that all payments to physicians not be tied to schedules as such, but be on the basis of their Usual, Customary, and Reasonable Fees.

FINANCE COMMITTEE

Mr. President and Members of the House of Delegates:

The Finance Committee, which is commissioned to assist the treasurer in fulfilling his responsibilities, met in 1966 along with legal counsel to consider several matters of interest.

On advice of legal counsel, it was determined that the restriction on selling securities should be removed, and that securities may again be sold and purchased as recommended by T. Rowe Price, investment counselors.

The possibility of creating a Med-Chi Foundation was investigated and it was moved unanimously to table indefinitely such a concept. It was pointed out that such a foundation would have no tax benefits, inasmuch as the Faculty is already an Internal Revenue Service-approved non-profit organization for library facilities contributions, and that there is no specific, demonstrated need for such a foundation otherwise.

After discussion, the Finance Committee agreed that there should be no set policy for accepting contributions by donation or bequest, or for establishing special funds. Each proposal will be considered individually.

One such fund accepted was the assignment of royalty payments and other contributions as stated in the proposal of Henry P. Laughlin, MD, with certain provisos and recommendations.

Raymond C. V. Robinson, MD

LEGISLATIVE COMMITTEE

Mr. President and Members of the House of Delegates:

The 1967 Legislative year has been one of the most active in the history of the Faculty. With a newly reapportioned legislature and most of the membership of the House and the Senate new, we have had to embark on an educational program to ensure that the medical profession is recognized as being the protectors of the public's health.

Careful scrutiny of all bills reveals that some 61 bills in the House and 44 bills in the Senate had some medical connotation. Everything from Chiropractic, Osteopathic, Abortion, Podiatry, and countless other health and health-related matters were considered.

In addition to the specific legislative matters and bills involved with this session of the legislature, it was necessary to actively participate in budget hearings in connection with the medical care program to ensure that funds for operation of this program remained intact.

An expression of thanks goes to all the physicians who so willingly gave of their time and efforts to appear before special and regular Committee Hearings in Annapolis. Without their assistance the successful prosecution of our task would have been impossible.

A summary of the most important bills in both the House and Senate is as follows:

HOUSE BILLS

House Bill 15.—Redefining the legal definition of sanity.

House Bill 19.—Change in the Nurses Practice Act to provide for stronger educational requirements; and to prohibit any but licensed persons from calling themselves "nurse."

House Bill 38.—Requiring physical testing of driving ability of drivers over 65 years of age; and requiring eye examinations for all drivers on occasion of license renewals.

House Bill 70.—Making it obligatory that all school bus operators have an initial physical examination and biennially thereafter.

House Bill 73.—Implied Consent law to provide for testing by blood alcohol level only.

House Bill 78.—Providing that non-profit institutions may not plead as a defense to a tort action the fact that it is non-profit.

House Bill 147.—Providing that certain records kept by the Department of Motor Vehicles shall be confidential as regards request for information from insurance carriers.

House Bill 187.—Making it a felony to sell or dispense amphetamines or barbiturates without a prescription, except by physicians, manufacturers in the regular course of practicing their profession or business.

House Bill 188.—Making it illegal to operate a motor vehicle while under the influence of amphetamines or barbiturates.

House Bill 189.—Creating the offense of selling, peddling, or dispensing amphetamines or barbiturates to minors.

House Bill 215.—Creating a Board of Dispensing Opticians, and authorizing certification of same.

House Bill 221.—Allowing Osteopaths to practice medicine and surgery.

House Bill 228.—Making it unlawful for persons under 18 to purchase "certain harmful substances" when not accompanied by parent or adult (fingernail polish, airplane glue, etc.).

House Bill 260.—Prohibiting inclusion of subrogation clauses as to medical payments in automobile liability policies.

House Bill 262.—Requiring attachment of anti-air pollution devices to exhaust systems of all new buildings and new improvements to buildings from which substances causing air pollution are exhausted.

House Bill 265.—Changing the compensation paid to members of Medical Advisory Board to Department of Motor Vehicles.

House Bill 272.—Creating additional nursing scholarships.

House Bill 276.—Providing for clarification of the present abortion law and providing that such abortions must be performed in a duly licensed hospital.

House Bill 338.—Requiring the Air Pollution Control Council to publish rules and regulations setting forth criteria for approval of motor vehicle pollution control devices.

House Bill 339.—Requiring mufflers adequate to prevent discharge of excessive fumes into ambient air.

House Bill 347.—Requiring warning to be placed on labels of certain drugs when consumption of alcoholic beverages may be harmful to health, and providing for penalty against physician who does not do so.

House Bill 359.—Requiring public and private agencies to furnish to the DMV names of persons receiving benefits, services, exemptions, or treatment as blind or nearly blind persons and authorizing cancellation of drivers' licenses of such persons.

House Bill 387.—Amending the law requiring certain injuries in Anne Arundel County to be added to the list where such must be reported to police.

House Bill 443.—Increasing beer tax, with such additional revenue to be allocated to the Department of Mental Hygiene to help defray the cost of treating alcoholics.

House Bill 449.—Authorizing Charles County to issue bonds for construction and equipping a non-profit nursing home.

House Bill 455.—Providing for a representative of the Maryland Nursing Home Association to be added to the Governors' Commission on Problems of the Aging.

House Bill 456.—Increasing the membership of the State Board of Health and Mental Hygiene by adding a representative of the propriety nursing homes in the State.

House Bill 473.—Establishing standards for "loss of hearing" in occupational compensation cases.

House Bill 506.—Implied Consent legislation—see similar bills in Senate and House.

House Bill 515.—Creating a Council on Hospital Affairs and giving it broad authority over hospital and health activities.

House Bill 531.—Adding chiropractors to the list for whom payment for services will be provided under the Medical Care program.

House Bill 537.—Requiring seat belts in all school buses.

House Bill 538.—Providing that individuals, physicians, and hospitals report certain diseases or conditions to the Medical Advisory Board, Department of Motor Vehicles.

House Bill 539.—Changing the visual acuity standards for motor vehicle licenses.

House Bill 541.—Providing that commercial insurance carriers may compensate chiropractors for services rendered.

House Bill 547.—Changing educational requirements for chiropractic licensure.

House Bill 572.—Providing for inspection without warrant of premises where dogs are bought, sold, traded or bred; exempting scientific or research premises.

House Bill 595.—Establishing a certification requirement for hearing aid dealers and setting up an Advisory Council for same.

House Bill 691.—Providing for hospital services or medical treatment of minors without parental consent when they believe themselves to have, or do have venereal disease; or believe themselves to be, or are pregnant.

House Bill 712.—Providing for regulation of pharmacies and defining "pharmacy."

House Bill 736.—Redefining the definition of Physical Therapy.

House Bill 743.—Excluding the Sheriff of Baltimore County from the responsibility of ensuring physicians are registered in the County Clerk's office.

House Bill 746.—Requiring the State Board of Health and Mental Hygiene to supply psychiatric examination and treatment for emotionally disturbed students.

House Bill 747.—Providing the school system to perform psychological testing of children when indicated.

House Bill 765.—Requiring notification of Department of Motor Vehicles of drivers convicted of driving under the influence of narcotics.

House Bill 766.—Changing provision for licensing of physicians by making reciprocity mandatory instead of permissive.

House Bill 796.—Repealing bond authorization of $3,000,000 for Baltimore City to build a central health and morgue building.

House Bill 874.—Establishing a provision for Physical Therapist apprentices.

House Bill 901.—Transferring the functions of the Air Pollution Control Council to the State Department of Health.

House Bill 935.—Requiring members of volunteer ambulance and rescue squads to complete Red Cross or First Aid courses in order to be exempt from prosecution under the Good Samaritan Law.

House Bill 945.—Establishing a licensing law for ambulances.

House Bill 947.—Revising laws on emergency admissions of mentally ill persons to mental health facilities.

House Bill 955.—Providing for extension of deadline for construction of outpatient buildings at University of Maryland Medical School.

House Bill 957.—Repeal of Charles County bond authorization for erection of a new hospital.

House Bill 962.—Permitting State Board of Health and Mental Hygiene to appoint staff and exempting them from the provisions of the Standard Salary Board.

House Bill 1034.—Clarifying certain exemptions under barbital and hypnotic drug laws.

House Bill 1037.—Restricting the subrogation rights of insurance carriers and hospital and medical service corporation.

House Bill 1051.—Providing for a premarital STS.

House Bill 1068.—Providing that physical examinations for work permits for minors may be performed by any licensed physician.

House Bill 1070.—Changing the composition of the State Board of Health and Mental Hygiene by adding the Commissioner of Health and the Commissioner of Mental Hygiene and having them designated as Chairman and Vice-Chairman by the Governor; and changing the responsibilities of the Board.

House Bill 1103.—Providing for a change in the dental laws.

HOUSE RESOLUTIONS

No. 48.—Proposing Study Group to consider problem of alcoholism in Maryland and make recommendations as to possible solutions.

No. 75.—Requesting Department of Health to investigate question of standards set for mobile vendors of "soft ice cream" and "snowballs" in State.

No. 79.—Relating to improprieties of certain insurance companies providing hospital insurance to persons 65 and older.

SENATE BILLS

Senate Bill 21.—This bill would permit the Mental Hygiene Commissioner to designate any psychiatrist in the Department of Mental Hygiene to conduct sanity examinations authorized by law.

Senate Bill 75.—Revision of the Dental Laws, providing for notification by dentists of address changes, among other things.

Senate Bill 105.—Implied Consent law; providing for the taking of an alcohol test or face license revocation.

Senate Bill 127.—Restricting the sale, possession, manufacture or use of LSD, unless by physicians in the case of scientific use or research.

Senate Bill 130.—Increasing the number of medical school scholarships from 10 to 20, with such scholarships being repaid by practice in areas declared to be in need of a physician.

Senate Bill 134.—Implied Consent (See Senate Bill 105).

Senate Bill 181.—Exempting physicians to whom patients may be referred for laboratory tests from permit requirements; also to exempt hospital laboratories from the same requirement if supervised by a physician.

Senate Bill 197.—Providing for nursing scholarships.

Senate Bill 203.—Permitting Osteopaths to practice medicine and surgery.

Senate Bill 283.—Defining the term "pharmacy" and authorizing issuance of rules and regulations.

Senate Bill 284.—Specifying what type of advertising may be done by a Pharmacy.

Senate Bill 290.—Amending the definition of Podiatry.

Senate Bill 315.—Providing for examinations of minors without parental consent who have or suspect they have venereal disease or are or suspect themselves to be pregnant.

Senate Bill 325.—Implied Consent law (See Senate Bill 105).

Senate Bill 342.—Providing for inspection without a warrant of premises on which 25 or more dogs are kept—exempts scientific or research premises.

Senate Bill 354.—Abolishing the Air Pollution Advisory Council and transferring these responsibilities to the State Department of Health.

Senate Bill 357.—Changing the compensation of members of Board of Physical Therapy Examiners.

Senate Bill 359.—Work permits for minors, removing legal requirement that they be issued only by "designated physicians," and substituting the issuing authority as the county school superintendent; after physical examination by a duly licensed physician.

Senate Bill 363.—Establishing a Governor's inter-departmental Commission and Advisory Council on Handicapped.

Senate Bill 381.—Increasing the tax on alcoholic beverages, revenue from which would be used to establish an Alcoholics' Rehabilitation Fund to be administered by Commissioner of Mental Hygiene.

Senate Bill 390.—Increasing the state debt and loan fund for non-profit hospitals.

Senate Bill 391.—Abolishing Advisory Council on Hospital Licensing and Advisory Council on Hospital Construction; and establishing an Advisory Council on Medical Facilities Construction and Licensing.

Senate Bill 410.—Providing for state subdivisions to pay 20% of hospital costs for medical care program patients from their subdivision.

Senate Bill 457.—Amending the law to exclude from *any* school in Maryland any worker with communicable tuberculosis.

Senate Bill 458.—Establishing authority for licensing users of ionizing radiation.

Senate Bill 459.—Amending the Laboratory law to permit advertising by any laboratory.

Senate Bill 474.—Permitting hospitals to notify parents to have infant tested for PKU after discharge from hospital, if such has not been done while infant was in hospital.

Senate Bill 482.—Amending the law to provide for $20,000,000 additional loan funds for voluntary, non-profit hospitals.

Senate Bill 486.—Amending the medical care law to provide for payment for Optometrists' services.

Senate Bill 508.—Repealing law that provided for bond authorization of $3,000,000 for a Central Health and Morgue Building in Baltimore City.

Senate Bill 512.—Amending the Chiropractic Law to provide for licensure without examination, if certified by the National Chiropractic Examining Board.

Senate Bill 513.—Allowing Chiropractors to be compensated under commercial insurance policies.

Senate Bill 565.—Providing for emergency admission of persons to mental health facilities.

Senate Bill 577.—Including pharmacy services in non-profit health service plans.

Senate Bill 596.—Authorizing the Department of Motor Vehicles to undertake a study of emergency medical facilities in Maryland.

Senate Bill 601.—Authorizing the Department of Motor Vehicles to establish minimum physical and mental standards for motor vehicle operators.

Senate Bill 602.—Authorizing the Department of Motor Vehicles to define physical or mental disorders that may prevent a person from exercising reasonable control over a motor vehicle, and requiring reporting of such by physicians.

Senate Bill 603.—Providing for a medical examination of a motor vehicle operator who has two convictions of drunken driving.

Senate Bill 665.—Establishing a center and hospital for psychiatric research.

Senate Bill 673.—Providing an alternative method by which the Department of Mental Hygiene may investigate and determine the financial conditions and eligibility of patients.

Senate Bill 675.—Changing the abortion law by defining when abortions may be performed legally (more restrictive.)

Senate Bill 676.—Providing that abortions may be performed only when the patient has been a resident of Maryland for one year prior to the abortion.

Senate Bill 677.—Creating the position of Deputy Commissioner of Mental Hygiene.

Senate Bill 694.—Defining child care centers and providing procedure for 50% of the cost of reimbursement by State of hospitals operating child care centers.

SENATE RESOLUTIONS

No. 8.—Requested implementation of law providing that narcotic addicts may be committed to an institution or hospital for treatment rather than sentenced to jail.

JOINT RESOLUTIONS

Senate 10.—Requested State Board of Health and Mental Hygiene to make a study of the feasibility of establishing requirements for food handlers' permits.

Senate 36.—Requested Legislative Council to consider feasibility of combining the Departments of Health, Welfare, and Mental Health into one department.

Senate 32 and House 34.—Requested Governor to appoint Commission to study guardianship problem posed by mentally retarded and handicapped and State's role therein.

Senate 55.—Urged Governor to request from Legislature in supplemental budget, $433,000 to complete funds necessary to build proposed new Medical Examiner's Facility in Baltimore City.

House 3.—Requested Governor to establish coordinating committee of State agencies concerned with education and rehabilitation of handicapped children in Maryland.

House 4.—Requested Governor to appoint Commission to continue and extend the work of 1966 Governor's Commission to Study Education Needs of Handicapped Children.

House 14.—Requested Governor to appoint Commission to study establishment of recreational centers for persons discharged or on leave or paroled from mental institutions.

House 45.—Requested Governor to appoint Study Group to examine feasibility of establishing subsidies for interns and residents in hospitals in Maryland to relieve shortage of interns and residents.

House 67.—Promote awareness of objectives and findings of Workshop and Rehabilitation Facility Planning currently conducted by Division of Vocational Rehabilitation of State Department of Education in cooperation with other State and community rehabilitation oriented organizations.

Respectfully submitted,
B. Martin Middleton, MD, Chairman
Benjamin S. Crosby, Jr., DDS
I. Rivers Hanson, MD
Karl F. Mech, MD
Belden R. Reap, MD, LLB

LIAISON COMMITTEE

Mr. President and Members of the House of Delegates:

Two meetings of the full Committee were held during the past year, in addition to which the Subcommittee on Pharmacy held two lengthy sessions.

In connection with liaison with state agencies concerning the shortage of general practitioners, it was announced that ten Senatorial Scholarships had been awarded for 1966-67 from twenty-two applications. The State Health Department in conjunction with the Medical and Chirurgical Faculty will determine the areas of need in the State, where these scholarship winners will be designated to practice as a condition of their awards.

It was also announced that a compendium of laws, rules, and regulations with which physicians must comply has been compiled and distributed to the membership.

Physical examinations for school bus drivers were under study with the Faculty expressing concern over certain areas of the form required by the State Superintendent of Transportation.

Other matters which came up for discussion included work permits for minors; drug discounts for Medical Care patients; nurses' responsibility in dispensing drugs and also interpreting EKGs in coronary care units; screening and revising of all State Health Department, insurance, and laboratory forms; as well as the communicable disease reporting form.

The Pharmacy Liaison Subcommittee voted to adopt a formal position in opposition to the compulsory use of generic drugs in any federal or state medical care program, and also resolved to recommend to the Liaison Committee that it oppose any attempt to establish a formulary system for any medical care program in Maryland.

In connection with volume discounting, the Subcommittee then voted: 1) that the Pharmaceutical Manufacturers Association be contacted with a view to striving for continued reduction in drug prices, and that as more and more third party payments for drug expenses occur, continued pressures will be exerted for the reduction of drug prices; 2) to bring to the attention of the Occupational Health Committee that many industrial clinics are either intentionally or unintentionally providing drugs at wholesale cost to employees which may be in violation of the State's drug laws; 3) to refer to the Liaison Committee the question of whether or not the Faculty should adopt a position on the matter of volume discounts offered to the State Health Department in operation of Medical Care programs.

The new chairman of the Medicine and Religion Subcommittee attended a workshop conference in Chicago from which much information was gained.

Both the Faculty and the Maryland Pharmaceutical Association went on record as being opposed to the abolition of the Council on Medical Care of the State.

Respectfully submitted,
William L. Stewart, MD, Chairman
Aris T. Allen, MD
Melvin N. Borden, MD
Robert E. Farber, MD
Paul F. Guerin, MD
Claude D. Hill, MD
Elmer N. Hoffman, DDS

H. Leonard Warres, MD

PHARMACY LIAISON SUBCOMMITTEE: Melvin N. Borden, MD, Chairman; John F. Schaefer, MD, Edgard P. Williamson, MD, Mr. Nathan I. Gruz, Mr. Wilford H. Gluckstern, Mr. Victor H. Morgenroth, Jr., Mr. Morris R. Yaffe.

SUBCOMMITTEE ON RADIOLOGY SERVICES: H. Leonard Warres, MD, Chairman

SUBCOMMITTEE ON MEDICINE AND RELIGION: Donald W. Mintzer, MD, Chairman; James G. Arnold, MD, Frederick D. Dove, Jr., MD, I. Bradshaw Higgins, MD, Harry L. Knipp, MD, Louis Krause, MD, Karl F. Mech, MD, Sidney J. Venable, MD, Frederick J. Vollmer, MD, Joseph B. Workman, MD.

LIBRARY AND HISTORY COMMITTEE
FINNEY FUND COMMITTEE

Mr. President and Members of the House of Delegates:

During 1966 several projects were considered by the Library Committee, namely the engagement of a library consultant who is a specialist in rare book collections, and, the possibility of securing a construction grant for an addition to the present building. This would increase the library stack capacity, provide a rare book room and history of medicine section, and include a museum. As of the end of the year Mr. Lee Ash, New Haven, Connecticut, had been secured to visit the library in January to make a preliminary survey of the collection and estimate the cost of completing the job.

In May Mrs. Gloria Miller resigned to take a position with Baetjer Memorial Library at The Johns Hopkins Hospital. Since that time we employed a librarian from the Baltimore City School System, Miss Sarah Katzoff, as cataloger during the summer, and Mrs. Raquel Cabanilla from Manila, cataloger, during the fall. Mrs. Vera Anderson started as part-time clerical assistant in May. The position of assistant librarian remains unfilled.

The staff situation at year's end was as follows: One professional librarian; one clerical assistant, part-time, working three days a week, two part-time student assistants, and a maid who also assists with shelving and processing books and journals. One professional librarian is available for substitute and "extra" work on a very limited basis. The final analysis shows one full time librarian and the remainder of the staff part-time.

As many visits to county meetings have been made as time, weather, and staff permitted. It is hoped that these can be increased when the staff is back to normal. Books are taken to the meetings for charge-out and requests for special subjects, bibliographies, and books are received for subsequent filling.

The library became the recipient of an additional source of income for books and journals from the estate of Walter Ralph Steiner, MD, on the death of Amy L. Steiner, his sister and sole remaining beneficiary of his trust. This generous bequest will enable the library to purchase a considerable number of publications not now in our collection.

The usual outside activities of the library continued with the two-day regional meeting of the Medical Library Association in Baltimore in October, featuring courses in continuing education and prominent guest speakers from this area as well as Virginia and D.C. Mrs. Sanford attended the Advisory Council of Special Libraries Association Meeting in Albuquerque, representing the SLA Baltimore Chapter, the annual meeting of SLA in Minneapolis and the annual meeting of the Medical Library Association in Boston.

The library received the sum of $800 for a duplicate set of the Surgeon General's Catalogue during the year from Swets and Zeitlinger, Berwyn, Pa.

Statistics for the year 1966 are as follows:

Circulation	
Books	1,641
Journals	3,723
Vertical File (Pamphlets)	200
Total	5,564
Gifts (Books & Journals)	933
Xeroxing (pages)	6,311
Bibliographies	170
Volumes added:	
Journals	374
Books	430
Total volumes	804
Total volumes	93,136
Attendance	2,441

Richard V. Hauver, MD
John P. Haberlin, MD

MARYLAND MEDICAL SERVICE, INC.
BOARD OF TRUSTEES

Mr. President and Members of the House of Delegates:

Substantial increases in all areas of the Plan's operations were realized in 1966, along with the assumption of major new responsibilities in the administration of the Medicare program.

Despite the loss of some 32,000 members through the cancellation of a large group of employees of the State of Maryland, whose coverage was awarded to a commercial insurance company, enrollment increased by more than 56,400 (6.3%) during the year. At the end of the year, total membership of 946,000 was equivalent to 80.5% of that of our companion Blue Cross Plan. Group enrollment accounted for 80% of our membership, and there was heavy shifting from standard to special coverage and from Plan A to Plan B throughout the year. Much of the increase in direct enrollment was concentrated in the Blue Shield 65 program which was purchased heavily by Medicare-eligible Marylanders last spring.

Financially, the Plan operated on just about a break-even basis, experiencing a small underwriting gain of $40,000 (0.2%) during the year, as compared with a loss of over $226,000 (1.4%) in 1965. Earned subscription income reached a new high of $18,500,000 in 1966, up about $1.7 million from 1965. Incurred claims also reached a new high, $16.7 million, about $1,000,000 more than in the previous year. Operating expenses during the year rose from 35.2¢ to 36.2¢ per contract per month, an increase of 2.7%.

The volume of processed claims increased steadily in 1966, over 400,000 having been paid in the twelve-month period for an average of about 7,900 per week. Of these, 191,673 were of a surgical nature (with 119,673 having been provided in physicians' offices or hospital outpatient departments), 47,288 were medical in nature, 13,524 obstetrical, 51,653 anesthesiological, 32,175 pathological, and 57,953 radiological. Professional anesthesiology was provided in 61.6% of the inpatient surgical and obstetrical cases, and of the 10,863 consultations covered, 33.3% were of the multisystem nature.

During 1966, the number of participating physicians rose to 3,450 from 3,338 at the beginning of the year. This represents 92% of the physicians who provided services to Maryland Blue Shield subscribers during the year.

A reasonable and customary fees program was developed and filed with the Insurance Department in 1966, and although formal approval had not been received at year's end, it is our understanding that only some minor adjustments in contract language need to be worked out. The sale of this program in coming years should fill a growing need among our large group accounts and should receive enthusiastic acceptance by Maryland physicians.

Undoubtedly, our most time-consuming activity during the year was planning for and beginning the administration of the Medicare Part B program. After a relatively slow beginning, claims activity under this program mushroomed in the last three months of the year. At the end of the year claims were being received at the rate of 1,000 per day and, despite a doubling in staff and a great deal of overtime work, a substantial backlog had built up. By mid-February we had succeeded in reversing the trend, however, and as of this writing, a major reduction in the claims inventory has been accomplished. By early Spring, an average claims payment cycle of about three weeks should be established.

In closing, I wish to express my appreciation for the advice and counsel of the Blue Shield Board of Trustees and the members of the Reference and Appeals and Medical Relations Committees, all of whom have been most faithful in carrying out their responsibilities. To the staff of Blue Shield, who have given so unstintingly of their skills and time, much of it personal, are extended the thanks of all the Trustees.

Respectfully submitted,
J. Sheldon Eastland, MD, President
Maryland Medical Service, Inc.

MARYLAND STATE MEDICAL JOURNAL

Mr. President and Members of the House of Delegates:

The financial report for 1966 is as follows:

Cash income received from Journal advertising, subscriptions, and other sources	$86,660.89
Cost of publishing Journal, including salaries, etc., (exclusive of light, heat, office space)	$93,106.61
Expenses over income	$ 6,445.72

The figure shown is not a true deficit, however, as the cost of publishing the transactions of the House of Delegates and the Membership Directory are charged to the Journal. In addition, the Journal office turned over to the library many books sent for review. In any event, the financial picture of the Journal has improved over last year as the deficit for 1966 is approximately half of what it was in 1965. This is due, for the most part, to an increase in advertising over the past year.

During 1966, George H. Yeager, MD, resigned as editor of the Journal. Dr. Yeager had served as editor since the inception of the Journal and it was with sincere regret that his resignation was accepted. Mrs. Doris E. Fletcher, who had been managing editor for a number of years, also resigned, to accept another position.

Richard L. Masland, MD, and Moses Paulson, MD, accepted positions on the editorial board replacing Henry P. Laughlin, MD, and Louis R. Schoolman, MD, whose terms had expired. Our appreciation is extended to Drs. Laughlin and Schoolman for their valuable assistance in the past.

Although several personnel changes have taken place during the past year, there is no anticipated change in the editorial policy of the Journal.

In the past there had been a backlog of manuscripts, but this is no longer true. In fact, there is an acute shortage of scientific papers available for publication. Papers presented at several medical society meetings have been transcribed for use in the Journal and letters have been sent to many physicians and hospitals asking that they consider submitting material for publication. It is the desire of the editor and the editorial board to enlist the support of the members of the House of Delegates in assisting us to secure manuscripts for the Journal.

Respectfully submitted,
C. Thomas Flotte, MD, Editor
Alice W. Kellogg, Managing Editor
Editorial Board:
Leon W. Berube, MD
Houston S. Everett, MD
E. T. Lisansky, MD
Richard L. Masland, MD
Moses Paulson, MD
Edward C. H. Schmidt, MD

MEDIATION COMMITTEE

Mr. President and Members of the House of Delegates:

The Mediation Committee has met almost monthly during the past year. The number of questions raised by members, organizations and others continues to increase.

An Ethics Seminar was held on October 15, 1966, at which attendance was not all that could be desired. The proceedings were published in a subsequent issue of the Maryland State Medical Journal.

The most serious matter to come before this Committee during the year was a physician who was involved in obtaining "kickbacks" from a dispensing optician. This is in violation of Federal Trade Commission Rule #7. Once this was brought to the attention of the physician concerned, the practice was halted and on a recent check it was learned that it has not been resumed.

In appropriate cases, matters were referred to the Board of Medical Examiners for its consideration.

The Committee is in accord with the proposed changes in the Medical Practice Act, to provide for a Commission on Medical Discipline and specifying certain acts that would be unethical or illegal if committed by physicians.

A list of cases handled by Component Societies and those handled on a state level because the physician was a non-member of the component or by referral from a local level is depicted in the following chart.

	Mediation Cases 1966 Total	Cases for Complainant	Cases for Defendant	Cases Pending at 12/31/66	Cases Settled Mutually	No Action	Cases referred to Components	Referred to Board Medical Examiners	Reprimanded

MED-CHI INSURANCE TRUST

Mr. President and Members of the House of Delegates:

The Med-Chi Insurance Trustees have met almost every month since the Trust was organized in 1965 in an effort to increase the scope and efficiency of existing programs and to study the feasibility of new programs. Several of these meetings were attended by representatives of insurance companies, as well as, subscribers with insurance problems. The Trust now administers the following programs: (1) Health and Accident Insurance; (2) Major Medical and Accidental Death Insurance; (3) Blue Cross and Blue Shield; (4) Business Expense Disability Insurance; and (5) Life Insurance. As a result of a poll of members of the Medical and Chirurgical Faculty, additional types of programs are being investigated including liability insurance and a retirement program.

Beginning January 1, 1968, there will be a liberalization of regulations concerning tax free pension contributions for self employed individuals. By request of the Council, the Trustees are investigating various types of retirement plans and intend to initiate a retirement program prior to the expiration of this year.

All administrative functions for these programs are now centralized in the Trust office located in the Faculty building. This has resulted in an increased efficiency in the management of the programs, as well as, an increased convenience to subscribers or potential subscribers in obtaining information about insurance matters.

As each new program is developed, as far as possible, the following general policies will be followed:

(1) Bills for premiums, claims processing, processing of new applications, and the distribution of promotional material will be handled by the Central office.
(2) A written agreement will be obtained with each insurance company requiring an annual report to the Board of Trustees as well as specifications relative to the adjustment of premiums in relation to the experience of the program.
(3) Each new program will be reviewed by a consulting actuary in an effort to promote only financially sound and economical programs for the members of the Faculty.

We trust that these policies will result in a broad spectrum of good programs efficiently administered and enthusiastically supported by the membership.

Respectfully submitted,
Paul F. Guerin, MD, Chairman

MEDICAL ADVISORY COMMITTEE OF THE RED CROSS BLOOD BANK PROGRAM

Mr. President and Members of the House of Delegates:

The Baltimore Regional Blood Program of the American Red Cross operates as one of 55 blood centers throughout the country under the United States License No. 190 of the National Institutes of Health. It is a national voluntary blood donor service which produces one-half of the blood used in the United States. The Baltimore program was established in December 1958, to supplement the collections of the 32 hospital blood banks operating in the Baltimore area. The Red Cross now provides more than 44% of the whole blood used by these hospitals. In addition, the program is rapidly approaching a total supply of certain important blood derivatives.

The Baltimore Regional Chapter Program is and has been the largest single program in the Baltimore area and is the community's most significant voluntary donor program. It contributes more than any agency or group of agencies toward an adequate community supply of blood.

More than 800,000 individuals are protected by the Baltimore Regional Program, and this number continues to grow. Both group and individual plans of coverage are offered, making it possible for anyone in the community to participate and receive protection. The Red Cross has concentrated its efforts on the group donor coverage with only limited emphasis on the individual coverage. At the present time the total blood needs of the Baltimore area are estimated at approximately 72 thousand units per year.

The Baltimore program was originally established to supplement the hospital blood banks' supply by replacing the blood used for Red Cross eligibles. However, with the introduction of the revolving credit system, sufficient flexibility has been developed so that the Red Cross now distributes blood in advance of credits, which is used by the hospitals as needed for any patient. Accordingly, when the Red Cross advances blood to a hospital, it is considered the property of that hospital to be used as needed with the understanding that the hospital take steps to balance the credits used by Red Cross eligibles with the total amount advanced to the hospital.

The Red Cross does not transfuse any blood. It is the aim of the Red Cross, in partnership with the hospital blood banks, to obtain the total amount of blood needed.

The Red Cross also assists hospitals in supplying blood, as available, for community needs, including lifesaving emergencies, blood for leukemia and hemophilia patients, and blood for indigents.

All Red Cross blood which is not distributed for transfusion is processed into important derivatives. From December 1, 1958 to December 1, 1966, the 32 participating hospitals received the following:

191,456—units refrigerated whole blood
876—units serum albumin (5%)
4,644—units fresh frozen plasma
795—20 cc units serum albumin
3,643—100 cc units serum albumin
3,491—units gamma globulin
345—units fibrinogen
1,664—units packed red cells
37,576—units gamma globulin were also distributed through the Maryland State Department of Health.

Of the 191,456 units of refrigerated whole blood, 19,711 units were donated to the hospitals to assist those blood indigents who could not replace their own blood or were not able to shoulder the financial burden. From the PULSE refrigerator an additional 8,076 units were rushed to the hospitals to help save the lives of 1,742 patients who needed blood because of an unexpected bleeding emergency.

Tandearil®
oxyphenbutazone

Tandearil in Painful Shoulder

Therapeutic Effects: Stiffness and pain may diminish within 2 days, and full mobility may be restored within a week. These effects are obtained with oxyphenbutazone alone or combined with physiotherapy or local hormonal injections. The drug is usually well tolerated and does not affect pituitary-adrenal function or immune response.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with great caution in the first trimester of pregnancy.

Precautions: Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should be closely supervised and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage. Make regular blood counts. Discontinue the drug and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The most common are nausea, edema and drug rash. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, or a generalized allergic reaction may occur and require withdrawal of medication. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Painful Shoulder: 600 mg. daily in divided doses for 2 to 3 days; 300 mg. daily thereafter. Usual duration of therapy: 2 to 7 days.

Availability: Tablets of 100 mg. 6562-VI(B)R

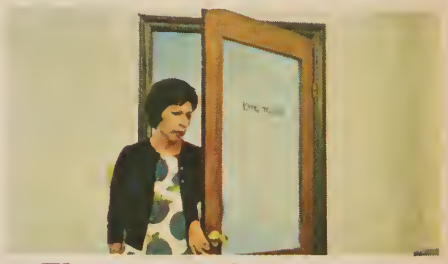
Why these 7 patients with moderate to severe anxiety may respond better to Mellaril

1. The agitated patient.
Anxiety—particularly that beyond the range of minor tranquilizers—frequently is expressed as gross motor restlessness, fidgetiness and purposeless movements, and may erupt into aggressive behavior. Mellaril is almost a specific for those patients whose anxiety follows such a pattern.

The psychosomatic patient.
The family physician is rarely given the agnostic luxury of a classic, textbook "anxiety state." Most often he must probe for anxiety masked by dysfunctional disorder—or which exacerbates a somatic problem. Double-blind evaluations have demonstrated that Mellaril can be a significant adjunct in the treatment of such patients.

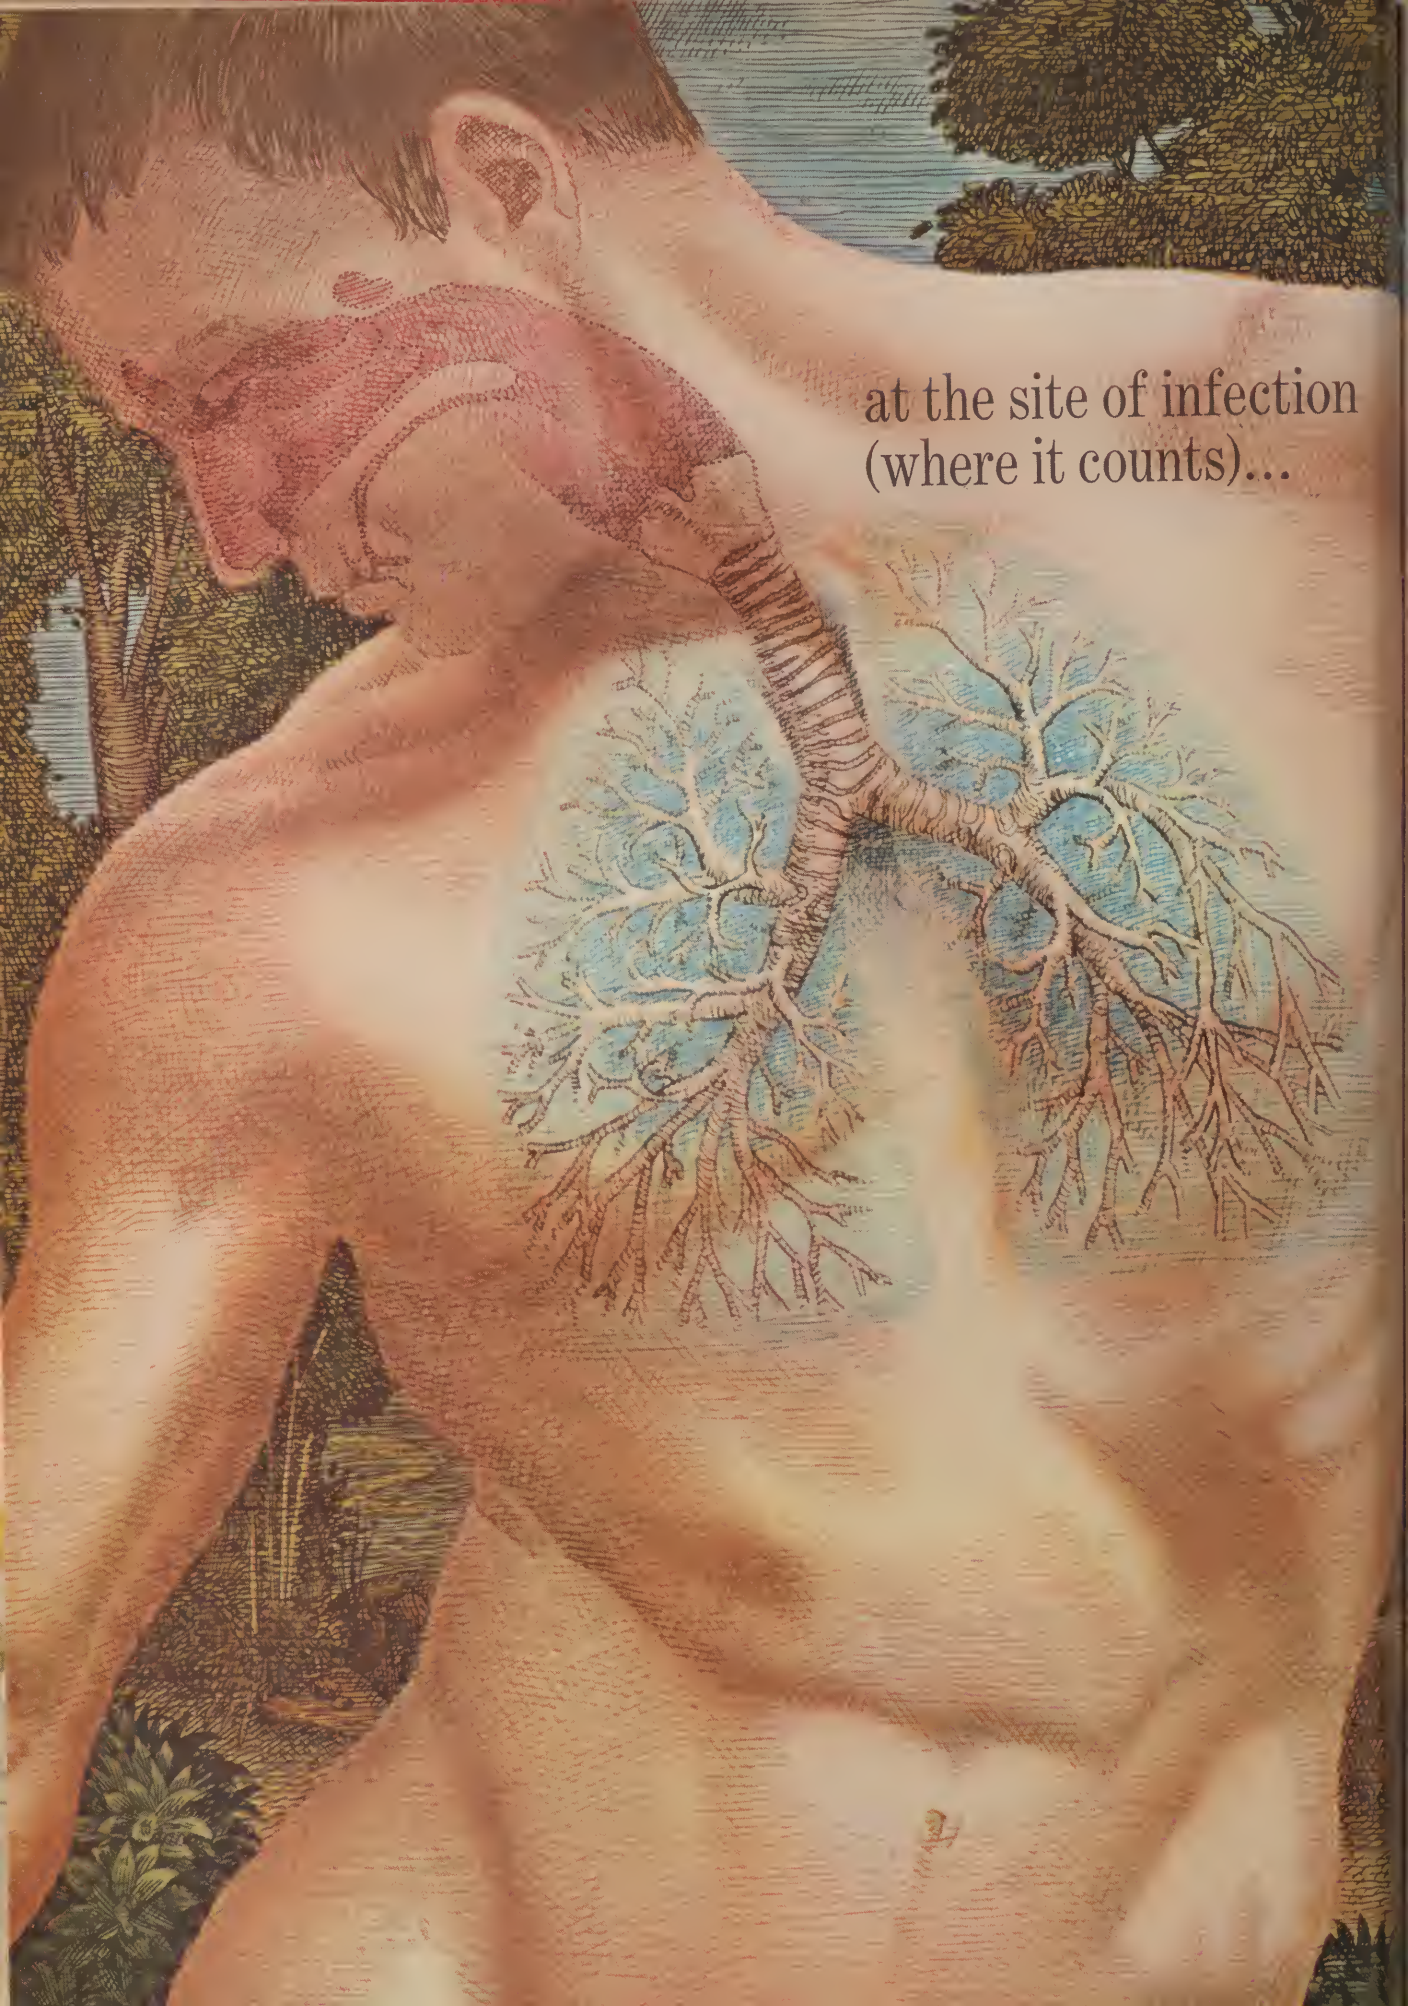
The patient under situational stress.
Mellaril helps the patient deal with stress of everyday life. Nonhabituating, it can be given for extended periods of time. It does not "separate" patient from practical problems or pressures, does not induce euphoria or fuzziness which can compromise the ability to cope with reality. Rather, it helps the patient move more competently in his daily world by eliminating useless tension, by allowing him to conserve emotional resources and energies, and to direct them against the problems really worth worrying about.



4. The menopausal patient.
The woman who sees change of life as the end of useful life requires support from both family and family physician. Whether the psychological impact of menopause is directly related to hormonal changes, or merely coincidental, is debatable, but estrogenic therapy is frequently inadequate. Mellaril is a useful aid for these patients and, alone, or in combination with reduced estrogen dosage, will help ease the menopausal misery.

5. The previously hospitalized psychiatric patient.
Such a patient may still require the type of medication he has been accustomed to, but because he is no longer in a controlled setting the acceptable level of adverse reactions must be lower. In such circumstances Mellaril is perhaps the drug of choice.

6. The agitated geriatric.
Tranquilizer therapy in the elderly patient always involves special (or at least accentuated) problems: the possibility of drug-induced ataxia, hypotension or depression, for example, assumes an additional significance. These reactions have rarely been observed in geriatric patients treated with Mellaril.



7. The constantly returning patient.
The anxiety patient who has not responded to a minor tranquilizer is not very likely to benefit from your minor tranquilizer of second choice. A major tranquilizer, such as Mellaril, may be indicated in such patients.

Contraindications: Severely depressed or comatose states from any cause, and in association with or following MAO inhibitors; severe hypertensive or hypotensive heart disease.
Precautions: Hypersensitivity reactions (e.g., leukopenia, agranulocytosis) and convulsive seizures are infrequent. Pigmentary retinopathy has been observed where doses in excess of those recommended were used for long periods of time. May potentiate central nervous system depressants, atropine, and phosphorus insecticides. Where complete mental alertness is required, administer the drug cautiously and increase dosage gradually. In addition, orthostatic hypotension (especially in female patients) has been observed. Epinephrine should be avoided in treatment of drug-induced hypotension.
Side Effects: Pseudoparkinsonism and other extrapyramidal disorders are infrequent; drowsiness, especially in high doses early in treatment, may occur; nocturnal confusion, dryness of the mouth, nasal stuffiness, headache, peripheral edema, lactation, galactorrhea, and inhibition of ejaculation are noted on occasion; photosensitivity and other allergic skin reactions may occur but are extremely rare.
Before prescribing, see package insert for full product information.

in moderate to severe anxiety, 25 mg. t.i.d.

Mellaril®
(thioridazine)

SANDOZ

at the site of infection
(where it counts)...

Ilosone® provides more antibacterial activity than any other oral erythromycin

Acid stable, better absorbed ... Ilosone produces faster, higher, more prolonged blood levels, even in the presence of food[1-3]

Because it is the most active form of oral erythromycin, Ilosone can help assure consistently greater antibacterial activity at the site of infection. Ilosone produces peak antibacterial blood levels two to four times those of other erythromycin preparations.[1,2] Not only are these levels attained earlier, but they are maintained for much longer periods. Even the presence of food does not seem to affect the activity of Ilosone.[1,3]

In the treatment of patients with bacterial infections susceptible to erythromycin, Ilosone has compiled an excellent therapeutic record. Since it exerts its greatest activity against gram-positive organisms, it is particularly useful in common respiratory and soft-tissue bacterial infections. Ilosone kills—not merely inhibits—streptococci, pneumococci, and more strains of staphylococci than any other macrolide antibiotic. This bactericidal action, coupled with the high antibacterial levels attained, makes Ilosone especially valuable in patients with low host resistance, such as infants, debilitated individuals, and diabetics.

Ilosone has shown no cross-resistance with penicillin and may be effective against organisms that have become resistant to that agent. Despite its high antibacterial activity, Ilosone has demonstrated a low incidence of side reactions. Blood dyscrasias, ototoxicity, and tooth staining have not been observed. Infrequent cases of drug idiosyncrasy, manifested by a cholestatic jaundice, have occurred, but there have been no known definite residual effects.

700121

Ilosone®
Erythromycin Estolate

Lilly

(See next page for prescribing information.)

Ilosone®/the most active oral form of erythromycin

Description: Ilosone is the most active form of oral erythromycin that has been developed. Because it is stable in acid, well absorbed, and excreted in lesser amounts in the bile, it provides faster, higher, and longer-lasting levels of antibacterial activity (ABA) in the serum, even when taken with food, than do comparable doses of erythromycin.

Indications: Ilosone is indicated in infections caused by microorganisms sensitive to its action (especially staphylococci, hemolytic streptococci, and pneumococci). The drug is therefore useful in a high proportion of bacterial diseases encountered in clinical practice and particularly in the treatment of bacterial infections of the upper and lower respiratory tract and soft tissues.

In the treatment of acute bacterial pharyngitis and tonsillitis, this antibiotic has promptly eradicated the bacteria (streptococci) and has produced a parallel prompt clinical improvement. There have been no group A beta-hemolytic streptococci resistant to this preparation. In beta-hemolytic streptococcus infections, treatment should be maintained for ten days to prevent the development of rheumatic fever or glomerulonephritis.

Erythromycin estolate has proved to be very effective in pneumococcus pneumonia and in acute bronchitis with pneumococci on culture. Bronchopneumonia and otitis media in children have responded well to its use.

The antibiotic has been used very successfully in staphylococcus infections. Good therapeutic results have been obtained in soft-tissue infections, abscesses, cellulitis, carbuncles, wound infections, and furunculosis.

In serious staphylococcus infections, erythromycin preparations should be used only in combination therapy with other antimicrobial agents. As is the case with any treatment regimen used in these severe conditions, surgical procedures should be performed when indicated, and large dosages of the antimicrobial agents should be employed. In this fashion, Ilosone has been effective in staphylococcus pneumonia, osteomyelitis, septicemia, empyema, and meningitis.

Multiple 500-mg. doses of the drug have been useful in gonorrhea and syphilis. Since penicillin is the drug of choice for the treatment of syphilis and gonorrhea, erythromycin estolate should be employed for these infections only in patients with a history of penicillin allergy. Also, other infections due to susceptible bacteria in patients known to be hypersensitive to penicillin or other antibiotics may be considered for treatment with Ilosone.

Contraindications: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

Side-Effects: Data obtained from seven years' use of propionyl erythromycin ester and erythromycin estolate (Ilosone) indicate that hepatic dysfunction with or without clinical jaundice may occur during or following courses of therapy with the drug.

Changes in liver function tests in such cases have been indicative of intrahepatic cholestasis. The symptoms appear to be the result of a form of sensitization. The initial symptoms have appeared in some cases after a few days of treatment but generally have followed one or two weeks of continuous therapy or several courses of the drug. Symptoms reappear promptly if the drug is readministered to sensitive patients, usually within forty-eight hours. Eosinophilia was noted in peripheral blood counts. The findings readily subsided without apparent residual effects when treatment was discontinued. Recovery was delayed in one reported instance. The physician indicated in this case that either drug-induced jaundice or viral hepatitis may have been responsible for the findings.

In one clinical study involving ninety-three patients treated with the antibiotic, three cases of jaundice were observed and an additional eleven cases developed some changes in liver function tests. Three of the patients had abnormal liver function tests a second time on readministration of the drug.

Even though it is assumed that not all cases of jaundice have been reported, it seems clear that the number is small compared with the amount of drug that has been used. Reported cases have included persons in whom there had been administered other drugs known to be associated at times with hepatic side-effects and cases in which the presence of viral hepatitis or other disease may have been responsible for the findings. In some of the cases, associated gastro-intestinal symptoms simulated the colic of biliary tract disease. In other instances, clinical symptoms and results of liver function tests resembled findings in extrahepatic obstructive jaundice. It appears that the occurrence of jaundice after administration of Ilosone is infrequent, but further investigations are being made to estimate its incidence more accurately.

In those cases mentioned above in which jaundice appeared to be definitely related to use of the drug, laboratory findings w characterized by increased direct-reacting bilirubin, eleva alkaline phosphatase levels, negative or weakly positive cepha flocculation and thymol turbidity tests, elevated serum gluta oxalacetic transaminase levels, peripheral eosinophilia, and n mal cholecystograms.

Individual idiosyncrasy seems evident since jaundice has b been reported in other patients taking prolonged courses of medication. Patients with chronic infection have been given 1 to 2 Gm. of the drug daily for periods of two to six months, a patients with rheumatic fever have taken prophylactic doses 0.5 Gm. daily for two years without difficulty. In one group 144 patients who received the drug daily for two years, no ja dice was noted. It was of interest that members of six of the patients' families, who were not taking the drug, had episod of jaundice during the study period.

Transaminase and serum alkaline phosphatase levels we determined in a group of fifty-four adults and children who to 250 mg. of Ilosone daily for an average of sixteen months a rheumatic fever prophylaxis. The results were compared wi those of a similar group of forty-four patients who received pe icillin. There were no cases of jaundice in either group. Elevati of SGPT and serum alkaline phosphatase levels during the cour of treatment was observed in one patient treated with Ilosone and in two patients treated with penicillin. Seven other patien in the group receiving Ilosone and four others in the penicil group showed elevations in one of the tests at some time durin administration of the drugs.

Very satisfactory therapeutic results, without toxicity, we reported in 102 pediatric patients who received short-term (te day) courses of Ilosone in the treatment of streptococcus inf tions. Results of liver function tests in these patients were co parable to those in a similar control group who had receiv penicillin.

Gastro-intestinal disturbances not associated with hepatic fects are observed in a small proportion of individuals as a res of a local stimulating effect of the medication on the alimenta tract; however, the normal intestinal gram-negative bacter flora is not appreciably altered by erythromycin drugs.

Although allergic manifestations are uncommon with the of erythromycin, there have been occasional reports of urtica skin eruptions, and, on rare occasions, anaphylaxis.

Administration and Dosage: Ilosone is administered orally.

Ilosone Pulvules®
Ilosone Chewable Tablets
Ilosone Drops
Ilosone, 125, for Oral Suspension

For infants and for children under twenty-five pounds of b weight, the usual dosage is 5 mg. per pound every six hours; f children twenty-five to fifty pounds, 125 mg. every six hou (Tablets Ilosone Chewable should be chewed or crushed a swallowed with water.)

For adults and for children over fifty pounds, the usual do of Ilosone is 250 mg. every six hours.

For severe infections, these dosages may be doubled.

When larger doses are indicated, parenteral erythrom therapy should be considered.

In the treatment of syphilis, the recommended total dosag 20 to 30 Gm. given in divided doses for a period of ten to fif days. Close follow-up of the patient is necessary since eryt mycin drugs have not had adequate evaluation in all stage syphilis. Examinations of spinal fluid are recommended as p of the follow-up therapy.

For gonorrhea, 500 mg. four times a day for four days recommended. In the treatment of gonorrhea, patients wi suspected lesion of syphilis should have a dark-field examina before receiving antibiotics, and monthly serologic tests sh be made for a period of three months.

How Supplied: Pulvules Ilosone, Capsules, N.F., 125 and 25 (equivalent to base), in bottles of 24 and 100.

Tablets Ilosone Chewable, N.F., 125 mg. (equivalent to ba in bottles of 50.

Ilosone Drops, 5 mg. (equivalent to base) per drop, in 1 size packages, with dropper calibrated at 25 and 50 mg.

Ilosone, 125, for Oral Suspension, N.F., 125 mg. (equiva to base) per 5-cc. teaspoonful, in 60 and 150-cc.-size pack

Eli Lilly and Company, Indianapolis, Indiana 46206.

The original agreement provided for the later development of a Lifesaving Emergency Blood Donor Corps, which would concentrate on enrolling persons of rare types and groups to further assist the hospital blood banks in meeting the general community needs. At a meeting of the Medical Advisory Steering Committee, November 13, 1963, it was considered highly desirable that the Red Cross should take steps to further expand its program to include the emergency donor corps. By so doing, the Red Cross established a separate blood inventory which is reserved for cases certified by the attending physician as being lifesaving emergencies. To make this program successful, the close cooperation of pathologists, blood technicians, and hospital administrators is essential. An effective control was established. The hospital technician is required to secure special authorization from the attending physician, which he submits in writing (within 72 hours) for review by the selected members of the Medical Advisory Committee. Replacements to the pool are made from special evening donations from members of PULSE (Public Unit for Life Saving Emergencies).

To establish the PULSE donor corps, the Red Cross Recruitment Committee and staff visited the existing blood assurance groups to enlist the support of management and the cooperation of their groups to obtain individual pledges to give blood on call. The Red Cross also invited the general public to join the emergency corps. The active support of the Baltimore Metropolitan Coordinating Blood Council, the Association of Commerce, the AFL-CIO Labor Council, and other appropriate organizations was sought. The PULSE donor corps was properly publicized to stimulate group and individual participation. All donors who are not already covered receive assurance of blood replacement for themselves and their families. The emphasis is placed on community service.

A special group of Red Cross volunteers was organized to assist in scheduling the appointments for the evening PULSE donations. All bloods collected are drawn by certified registered nurses under the supervision of a licensed physician, in accordance with the medical standards of the National Institutes of Health.

The PULSE program requires the continuing cooperation and support extended by civic leaders, the medical and hospital authorities, and the donors who are concerned with the blood needs of our community.

Respectfully submitted,
Everett S. Diggs, MD
C. Thomas Flotte, MD
Carroll L. Spurling, MD
Gerald A. Galvin, MD

MEDICAL EMERGENCY DISASTER SERVICES COMMITTEE

Mr. President and Members of the House of Delegates:

Members of the Committee attended the first annual Metropolitan Area Professions Disaster Training Seminar held September 29, 30, and October 1, 1966 in Washington, D.C. The agenda included talks by people experienced in the field on disaster training, panel discussions, movies and an actual disaster drill. The Chairman of this Committee acted as moderator for the afternoon session of the first day. Plans are presently being made for the second annual Seminar and this Committee Chairman is participating in those plans.

The Maryland Plan for Emergency Management of Resources has been approved by the Office of Emergency Planning. A copy is on file in the Faculty office. A certificate of appreciation has been received for the Chairman's participation on behalf of the MEDS Committee, signed by Director of Emergency Planning in the Executive Office of the President of the United States. A letter of appreciation was also received from Governor Tawes.

As a result of House Joint Resolution 62 approved at the 1966 session of the legislature, it was understood that a course for ambulance drivers would be added to the curriculum at the University of Maryland. However, no further details have been received.

Edward L. J. Krieg, MD, a member of the Committee, conducted two disaster drills during the past year. The first was held in November, 1966 with the cooperation of the State Health Department. A 100 bed station was set up, simulated wounded were brought in and relayed to the proper treatment areas. Radio communication was established with disaster spots, one at Montebello State Hospital and another north of the Baltimore City line. About 50 to 75 nurses, doctors, and nuns from Bon Secours, St. Agnes, St. Joseph, Women's and Union Memorial Hospitals participated. The public was invited.

A surprise drill was held in January 1967 at St. Agnes Hospital in which high school students from Cardinal Gibbons participated. The Operating Room Supervisor spent several weeks in teaching them how to simulate every kind of injury or illness. Within ten minutes of notification the entire disaster plan was put into effect and all simulated patients were put into proper treatment areas. Within two hours, the entire drill was completed and was followed by a critique held with the entire staff.

The Chairman will represent the Faculty at a Conference on Emergency Medical Services in Chicago, sponsored by the American Medical Association, on April 6, 7, 1967.

Respectfully submitted,
Charles J. Savarese, Jr., MD, Chairman
Frank E. Brumback, MD
Raymond M. Cunningham, MD
E. Roderick Shipley, MD
R. Lane Wroth, MD
Edward L. J. Krieg, MD
Kirk Moore, MD
William J. Peeples, MD
Robert J. Wilder, MD

MEDICOLEGAL COMMITTEE

Mr. President and Members of the House of Delegates:

The Medicolegal Committee and its various subcommittees held frequent sessions during the year, which were designed to achieve greater understanding and cooperation between the medical and legal professions.

Amendments to the Medicolegal Code of Cooperation were approved both by the Bar Associations and the Faculty's House of Delegates, with further study to be given certain amendments. Other topics discussed and referred to the proper subcommittees included symposia, status of proposed legislation, expert witnesses, and the necessity for specialist consultants in hospitals over weekends.

The Symposia Management Subcommittee held a symposium in December titled "Medical Tests Exposed in Court." Subject matter included laboratory test interpretation, the significance of results to the physician, clinical testing for patients involving the heart, lungs, brain, etc., and interpretation of EKGs, EEGs, etc.

The Subcommittee on Court Procedures studied in detail a plan recently adopted in Nevada by the Washoe County Medical Society and Bar Association, one of the few such plans in the country in which a panel meets periodically to consider requests submitted by an attorney and client in cases involving alleged professional negligence. Opinion of most in the discussion was that physicians would be willing to serve on such a panel if its findings were binding on both parties. It was also the consensus that if the decision of the panel was that the claimant probably had a good case, an expert witness from the medical profession should be supplied. Additional information on the workability of the scheme was to be sought for a report to the full Medicolegal Committee.

The Subcommittee on Interprofessional Relations held a lengthy discussion of policy on the possible reduction of fees in Workmen's Compensation cases as proposed by an attorney. The latter, a member of a committee on the Workmen's Compensation Commission group, had questioned whether doctors were entitled to "usual and customary" fees rather than the scheduled fees presently allowed when other groups were foregoing certain rights.

In rebuttal, it was submitted that attorneys practicing in the Workmen's Compensation field suffer no fee hardship, and that doctors should be compensated at their usual, customary, and reasonable rates.

Some twenty-six cases involving disputes or inquiries between doctors and lawyers were brought before this Subcommittee at its several meetings.

A report was given on a meeting of the American Medical Association and the American Bar Association referring mainly to patient referrals.

Respectfully submitted,
Howard F. Kinnamon, MD, Chairman
Conrad Acton, MD
James G. Arnold, Jr., MD
Russell S. Fisher, MD

J. Elliot Levi, MD
F. Ford Loker, MD
Belden R. Reap, MD, LLB
Edwin R. Ruzicka, MD
William G. Speed, 3rd, MD
John F. Strahan, MD

INTERPROFESSIONAL RELATIONS SUBCOMMITTEE: Russell S. Fisher, MD, Robert W. Johnson, 3rd, MD, Belden R. Reap, MD, LLB, William G. Speed, 3rd, MD.

SUBCOMMITTEE ON COURT PROCEDURES: Conrad Acton, MD, John F. Strahan, MD, F. Ford Loker, MD.

SYMPOSIA MANAGEMENT SUBCOMMITTEE: James G. Arnold, Jr., MD, J. Elliot Levi, MD, Edwin R. Ruzicka, MD.

MEMBERSHIP COMMITTEE

Mr. President and Members of the House of Delegates:

The Membership Committee appropriately continued to discuss guidelines for attracting new members. As a point of information, the question was discussed of what percentage of licensed physicians in the State are covered by the membership rolls of 3,502 Active and 327 Associate and Affiliates (as of May, 1966). This matter will be better determined when Baltimore City completes its compilation of membership figures.

It was recommended to the Executive Committee, after lengthy discussion, that conditions of physician's defense for Associate members remain as presently spelled out in the Bylaws: i.e. available to Associate as well as Active members. This was felt to be a strong factor in attracting and retaining Associate members.

The membership booklet to be given new members is to be revised and up-dated, and will be included with the Compendium on Rules and Regulations of the State for Physicians as presentations to new members.

Under other discussions of recruitment of new members, an effort was initiated to interest more psychiatrists in taking an active part in the activities of the Faculty through membership.

Respectfully submitted,

OCCUPATIONAL HEALTH COMMITTEE

Mr. President and Members of the House of Delegates:

The Occupational Health Committee at its several meetings discussed the status of a group known as Executive Health Examiners, whose ethics had been questioned. This group, which conducts physical examinations for executives in some 300 cities in the United States, had run into difficulties with other state medical groups bringing about unanswered questions about the group's activities in Maryland. Further information was sought from New York and Washington, D.C. to determine the Examiners' status at this time.

This Committee was asked to consider the selection of a nominee for the Governor's Award to a Physician For Promotion of Employment of the Physically Handicapped, for 1967.

A State Public Health Nursing Consultant in Occupational Health presented a lengthy program on Industrial Nursing Responsibilities. Concern for the one-nurse unit was expressed since these nurses do not get the direct physician supervision considered necessary. It was reported that industry is presently using licensed practical nurses and first aid people to replace or supplement the nursing personnel. A registry of nurses has been set up so that available nurses for relief work can be contacted. Since 1960, the number of industrial nurses in Maryland has risen to more than 200 from 148. This Committee is to receive for its comment and advice, an industrial nurses' manual being compiled.

Respectfully submitted,
John R. Davis, MD, Chairman
Samuel N. Bacon, Jr., MD
Timothy D. Baker, MD
William F. Cox, III, MD

POLICY AND PLANNING COMMITTEE

Mr. President and Members of the House of Delegates:

The Policy and Planning Committee has concerned itself with many topics having to do with the varied aspects of its province such as unity in the profession and the collection of biographic data on physician members of the Faculty.

One aspect of the Committee's interest was studied by the "Ad Hoc Committee to Consider Changes in the Medical Practice Act." This Committee was formed to strengthen and modernize the Medical Practice Act in general and to establish improved means by which the profession might be able to discipline its members for acts of unethical or unprofessional conduct. Its action along these lines was reported to the parent body, the Policy and Planning Committee.

The final draft of the changes in the Medical Practice Act was submitted to the Deans of the two medical schools, the Chief Medical Examiner, and the President of the Board of Medical Examiners for their perusal. The final draft is to be presented to the Council for approval, and will then go to the House of Delegates.

This Ad Hoc Committee, headed by John M. Dennis, MD, has proposed that a body other than the Board of Medical Examiners be established and charged with the responsibility for disciplining all physicians in the State, guilty of unethical or unprofessional conduct. This State body would consist of the following Medical and Chirurgical Faculty officers: the President, the President-elect, and the immediate Past President; the Dean of The Johns Hopkins University School of Medicine; the Dean of the University of Maryland School of Medicine; the Chief Medical Examiner of Maryland; and two practicing physicians appointed by the Governor from a list submitted by the Faculty.

The Policy and Planning Committee also heard from the Library Committee in connection with grants from the federal government for construction and expansion of services. It was moved that this library activity should be pursued and funds from any source (including government sources) should be considered so long as acceptance of such funds does not in anyway jeopardize our position or status.

Relative to the need of Maryland communities for additional physicians, it was resolved that this Committee should recommend to the Council that a committee be formed to visit the Deans of the medical schools to remind them that there is a continuing shortage of family physicians in Maryland and ask permission to address students of all classes to discuss with them the various aspects of family practice.

Respectfully submitted,

AD HOC COMMITTEE TO CONSIDER CHANGES IN THE MEDICAL PRACTICE ACT: John M. Dennis, MD, Chairman, Lewis P. Gundry, MD, Karl F. Mech, MD, William A. Pillsbury, MD.

COMMITTEE ON POSTGRADUATE EDUCATION, PREVENTIVE MEDICINE, AND PUBLIC HEALTH

Mr. President and Members of the House of Delegates:

Although this large Committee has many Subcommittees, it is totally unlike the old woman in the shoe who had so many children she didn't know what to do. It is because of its multiple offspring that the parent body can obtain information on many problems, coordinate it, and pass on recommendations.

No action was taken by the Faculty Council on the Committee's recommendation that the Regional Medical Center (Heart, Stroke, and Cancer) program be approved. It was felt that there was no need for action on an already existing government program. The Council did, however, approve the recommendation that the Regional Medical Center be allowed to use the MEDIC network for an appropriate charge.

The *Subcommittee on Aging* recommended that endorsement be given to community sponsored nursing home facilities in all communities in Maryland where need is demonstrated for extended care facilities, nursing home care, and for custodial or domiciliary care. It was further moved that the Aging Subcommittee recommend that each local Commission on Aging stimulate activity in programming community sponsored nursing homes.

The *Subcommittee on Alcoholism* has been extremely active during the year, including discussions of conclusions reached by the Ad Hoc Committee on the Detoxification Center. A representative of the Alcoholism Subcommittee appeared in Annapolis during the current session of the Legislature in support of the budget for the Department of Mental Hygiene for funds to increase services for alcoholics. Several other bills were introduced in the State Legislature concerning alcoholism; one involved increasing the tax on beer to provide funds for alcoholic treatment facilities, and another to increase the tax on liquor for the same purpose.

Among the educational ventures engaged in by the Subcommittee was the distribution of some 77,000 pamphlets on the subject of alcoholism to the component societies for circulation to the high schools in their area. Prince George's County alone requested some 66,000 such pamphlets.

Other areas of discussion included the treatment of alcoholism in tuberculosis hospitals; in penal institutions; in industry; and transportation of the alcoholic to care facilities. A motion was sent to, and approved by, Council suggesting that staffs at the State Tuberculosis hospitals receive training in the treatment of the alcoholic/tubercular patient. No definitive actions were taken on the other items discussed.

The Subcommittee continued to encourage the allocation of beds in general hospitals for the treatment of alcoholics.

The *Subcommittee on Cancer* considered the establishment of a central cancer registry and good response was obtained to a canvass of the general hospitals in the State concerning such a registry. There are presently only a small number of hospitals with active cancer registries, but response to the canvass indicated that a majority of those in Maryland would be willing to cooperate. To be effective and accurate, such a registry would require a clerk for every 400 beds. Once the hospitals set up a registry, a carbon copy of the data collected could be sent to the central registry and coded for future use. While not of immediate value, its future value in observing trends in cancer could be most helpful.

The *Subcommittee on Child Welfare* has taken the lead in the campaign to designate May 21, 1967, as "End Measles Menace Sunday." This campaign is being sponsored by the Medical and Chirurgical Faculty, the State Health Department, local health departments, and the Maryland Jaycees. The Faculty allocated an amount of up to $15,000 from its Educational Fund for publicity purposes and will also underwrite other expenses. The condition for underwriting these expenses is that all components must use the vaccine provided by the Federal Government free for pre-school children and at a reduced cost for those of school age. A contribution of $1.00 for each immunization will be requested and will be used by the Faculty to defray the expenses, with any surplus to be kept in a special fund controlled by the Faculty and to be used for future immunization campaigns.

A booklet has been printed and distributed to the physicians of Maryland giving information on the child abuse law, which the Subcommittee was instrumental in formulating.

The *Subcommittee on Chronic Respiratory Diseases* has shown great interest in the subject of air pollution and has been vocal in support of the bill before the State Legislature to disband the present air pollution control council and replace it with an air quality control division of the State Health Department. It is particularly essential that a physician in the active practice of treating chest diseases be appointed to the State Board of Health and Mental Hygiene's Advisory Council since none has been represented there. There is such a physician now on the Baltimore City commission surveying means of air quality control.

Reports were submitted to this Subcommittee on such air pollution reduction agents as attachments in new automobiles to reduce the amount of sulphur dioxide expelled, and a new type of incinerator constructed to reduce the amount of fumes caused by burning of rubbish in Baltimore City.

The Subcommittee has attempted to locate funds from several sources for the establishment of a special facility at the Bolton Hill Nursing Home for the treatment of emphysema patients. This has not met with success. Contact will be made, however, to determine if facilities of the type necessary will be available at the new Good Samaritan Hospital being constructed.

The Subcommittee also discussed and approved the establishment of a clinic for ambulatory chronic respiratory disease patients to be operated by the Maryland General Hospital. This was endorsed by the Faculty Council.

The *Subcommittee on Continuing Medical Education,* which is charged with the operation of the MEDIC network, met as a whole twice during the past year. Three smaller groups were appointed to investigate separate areas of operation of the network. One will devise programs for the practicing physician; one will explore the possibility of broadening the programs to include presentations of particular interest to house staffs; and the third will investigate the potential uses of the network for the future.

For the coming year, programming will remain essentially the same, except that the Friday noon programs will all be produced from one of the community hospitals other than The Johns Hopkins or University Hospitals. However, the faculties of the latter two have expressed willingness to participate by giving lectures from the community hospitals. It is hoped that by this means the participation by each hospital in the network will be expanded. The Grand Rounds presentations will continue and additional programs will be added as plans are completed.

Other than scientific programs, the MEDIC network has been used by physicians for contacting the Faculty office to discuss matters with the accounting department, the administrative staff, and to borrow books from the library. Meetings have been held via the network by several medical and paramedical groups. As the availability of this type communication becomes more widely known, it is anticipated that many more physicians in the counties of Maryland will avail themselves of this fast and inexpensive means of contacting the Faculty offices in Baltimore.

Future plans for the network also include "spot announcements" to be broadcast prior to regularly scheduled programs to keep the physicians of the State informed of Faculty activities. In this way, information can be transmitted throughout the State simultaneously and without the delay and expense of mailings.

At this time the outlook is pessimistic for the possibility of using the Maryland Educational-Cultural Television network because of the lack of "prime-time" available for the relatively small physician audience.

While the Subcommittee realizes that MEDIC may not be the very best solution to the problem of making postgraduate programs available to all physicians in Maryland, it does eliminate the two hurdles of time and distance. Much discussion has been held as to the best time for program presentations, but as there is no optimum time at which all physicians could attend presentations, it was agreed that the Friday noon conferences will be continued. Tapes of all programs are made, however, and are available, with slides and printed material, for the use of any physician or group of physicians. These may be borrowed by contacting the Faculty office.

Although the MEDIC network has increased in usefulness to the physicians in Maryland, there still remains much that can be done. The Subcommittee was in agreement that the adaptability of the network is only now being explored and that its fullest potential may not be realized for several years.

The network now includes 30 hospital locations, a growth of 18 new hospitals from the beginning of the network in October 1965 when it included only 12 hospitals.

The Committee on Postgraduate Education, Preventive Medicine, and Public Health, therefore, recommends that the House of Delegates allocate from the Faculty's Educational Fund an amount of up to $15,600 for the continuation of the MEDIC network for the period from July 1967 to July 1968. These funds to be used for the actual transmission cost incurred by the network and the rental of the equipment at the Medical and Chirurgical Faculty office. This figure is based on the present monthly cost projected for a twelve month period.

The funds previously allotted ($25,000), have supported the operation of the network since its inception in October 1965 with enough remaining to continue operation through June 1967, a period of 21 months.

Appreciation is expressed to the administrators of each of the participating hospitals for their cooperation, and to the MEDIC representative at each hospital on whom falls the burden of detail work involved in presenting and evaluating the programs. Without the dedicated efforts of all of these persons, MEDIC could not operate successfully.

The *Maternal Welfare Subcommittee* has enlarged its membership and scope of activities during the past year. Among the decisions made was that if the Subcommittee were invited, the meetings would be held in conjunction with component society meetings throughout the State. This would involve either case presentations or presentations of other educational material. At present two such invitations have been received. In order to ob-

tain more detailed information concerning the maternal deaths occurring throughout the State, it is hoped that one person in each area can be designated to obtain from the physician in charge of the case, the authority to study the case and report to the Subcommittee.

All maternal deaths occurring in the State are reviewed by the Subcommittee. A report of the number of deaths and other pertinent material is shown in Tables I and II.

Future activities of the Subcommittee will include meetings with representatives of the Police Abortion Squad and the study of perinatal deaths in Maryland.

It was also resolved by the Subcommittee that whenever the entire Subcommittee studies a specific case, the physician involved will be invited to attend the meeting.

The Faculty Council, at the request of the Subcommittee approved a statement "That the Medical and Chirurgical Faculty go on record as recognizing the provision of family planning advice serves as an integral part of the practice of medicine, and that it urges the physicians of Maryland to provide such advice and services as are consistent with their own personal and moral convictions and those of their patients."

TABLE I

PROVISIONAL MATERNAL MORTALITY RATES*

	1966 No.	1965	1966 Rate	1965
Baltimore City	11	14	5.7	7.0
Total Counties	9	19	1.7	3.4
Total State of Maryland	20	33	2.8	4.3

*Per 10,000 live births.

The causes of death, by diagnosis, in these obstetric patients are shown in the following table.

GRAND TOTAL	9	11	20

The *Subcommittee on the Medical Aspects of Sports*, a new group, charged with concern for all types of sports activities including professional, collegiate, primary and secondary schools, as well as individual participation, had an interesting first year. For 1966-67, it was agreed that the most urgent need for attention was in the area of secondary school sports in Maryland, and consequently extensive investigation of such athletic programs was undertaken.

It is planned that guidelines for physical examinations for prospective athletes be formulated and distributed to the physicians in Maryland.

A meeting at the Round Table Luncheon during the Faculty Annual Meeting was arranged by this Subcommittee and will be open to all physicians who wish to participate.

The Subcommittee on the Medical Aspects of Sports agreed that, if at all possible, a physician be in attendance at all high school football games played in the State and available by phone for all other contact sports contests.

The *Speakers' Bureau Subcommittee* has not yet been organized, but is charged with compiling a list of speakers and topics of interest to the medical profession and making programs available to the component societies upon request.

The *Traffic Safety Subcommittee* has had an active and stimulating year. A widely attended Traffic Safety Seminar was planned by an Ad Hoc Committee. As a result of this Seminar, held on October 12, 1966, legislation involving visual acuity for drivers, and a reportable disease law was introduced in the 1967 State Legislature. The proceedings from this Seminar were published in the *Maryland State Medical Journal* with reprints available to interested groups.

In trying to coordinate the recommendations as to standards for physical examinations for licensed drivers, considerable study went into the visual acuity requirements. The final recommendation sets forth a minimum corrected visual acuity of 20/40 in one eye. The present standard in Maryland of 20/70 is one of the lowest in the country. It was agreed to accept the recommendation in this respect made by the Maryland Ophthalmological Society.

The Reportable Disease law stirred considerable controversy both within the medical profession and among legislators. Some eleven physical and mental conditions were finally included in the proposed law as reportable to the Medical Advisory Board of the Department of Motor Vehicles. None of these would automatically bring a loss of license, but would mean that records would be reviewed and if there were a question of an individual's ability to drive safely, he would be asked to appear before the Board with consequent recommendations as indicated.

The final disposition of these two bills will be reported in the report of the Legislative Committee to the House of Delegates.

COMMITTEE ON PROGRAM AND ARRANGEMENTS

Mr. President and Members of the House of Delegates:

Arrangements have been completed for the 169th Annual Meeting of the Medical and Chirurgical Faculty to be held at the Alcazar, April 19, 20, 21, 1967. All prominent out-of-State speakers have been obtained for the scientific sessions. As in previous years, there will be the annual Round Table Luncheon, Presidential Dinner, technical and scientific exhibits, and Health Evaluation Tests.

The 168th Annual Meeting in 1966 was most successful with a registration of approximately 1,200, of which 850 were physicians. All technical exhibit space was sold and a favorable rating was received from the Medical Exhibitors Association. An award was given by a pharmaceutical company for the outstanding scientific exhibit. The Committee on Program and Arrangements judged the exhibits, and a member of the Faculty was the co-author of the award winning exhibit. The Health Evaluation Tests were again taken by over 200 physicians, and many previously unknown abnormalities revealed.

The meeting was continued from April 29 to May 4, 1966 aboard ship to and from Bermuda. There were scientific sessions held and medical films shown each day, and these were extremely well attended, with a registration of 650 taken for attendance at the sessions. Because of the complete success of this cruise convention, Council approval has been received for a Caribbean Cruise Convention as part of the 1968 Annual Meeting.

The headquarters hotel for the 1966 Semiannual Meeting was the Diplomat Motor Hotel in Ocean City, Maryland. Facilities proved adequate and accommodations in general were most attractive and comfortable. All reservations were sold for the crab feast and dinner dance, which were held respectively at Phillips Crab House and The Diplomat. The day following the meeting of the Faculty, there were scientific sessions at the Diplomat by the Maryland Chapter of the College of Surgeons, the Maryland Psychiatric Society, and the Maryland Diabetes Association.

Our Committee expresses its appreciation to the Faculty members who have so willingly and ably assisted in making these meetings successful, and to the Faculty staff for its cooperation and untiring efforts in carrying out the many details in connection with the meetings.

Respectfully submitted,
JAMES B. BROOKS, MD, Chairman
THADDEUS E. PROUT, MD
JOSEPH D. B. KING, MD
DEWITT E. DELAWTER, MD
JOSEPH H. SEIPP, JR., DDS

SUBCOMMITTEE ON EXHIBITS: Thaddeus E. Prout, MD, Chairman; Joseph D. B. King, MD, Sheldon Friedman, Richard R. Crane.

PUBLIC RELATIONS COMMITTEE

Mr. President and Members of the House of Delegates:

A wide area of discussion covering many facets of public relations occupied the Public Relations Committee during the past year.

One of the main new fields of interest was career recruitment with the naming of a consultant to the Committee to serve as liaison between the Faculty and medical schools in health careers. His specific assignments were to make the schools aware that career material is available and to find responsible persons in the medical schools to help.

A Speech Training Seminar conducted by Smith Kline and French in October attracted some 50 participants and was judged an excellent seminar. Also successful was the Office Assistants Seminar held in the spring with consideration given to making such regional in nature.

Responsibility by this Committee for MEDIC was dropped, but it was suggested to the Continuing Medical Education Subcommittee, now responsible, that current news notes and tips to doctors might be used over the network as "spot" announcements.

The possibility of establishing a Boy Scout Explorer Medical Post is being explored, and lengthy consideration has been devoted to the possibility of docking the Shipe HOPE in Baltimore some time in the future.

Because of intense interest in the quarterly meetings of executive secretaries of component societies held on a year's trial basis, it was recommended that these be continued on a permanent basis. A similar type of meeting for presidents and secretaries of component societies was also proposed for discussion.

Representatives of the SAMA chapter at the University of Maryland reported on the growing interest in the annual Career Day held at the University of Maryland School of Medicine. Invitations this year went beyond the high school students previously invited and included private school students, as well as college students. It was also reported that an attempt was being made to establish a chapter of SAMA at The Johns Hopkins University School of Medicine. They now have members-at-large in the University of Maryland chapter.

Interest was expressed by the Public Relations Committee in the Health Fair sponsored by CICHA during Community Health Week, in 1967, which has been given Faculty Council endorsement.

The Committee also concerned itself at its meetings with news stories, books, etc. which engender controversy involving the medical profession. Good rapport with the news media was endorsed as the best means of countering a bad image of medicine.

Respectfully submitted,
MANNING W. ALDEN, MD, Chairman
DAVID S. CLAYMAN, MD
ROBERT B. GOLDSTEIN MD
CALVIN Y. HADIDIAN, MD
E. RODERICK SHIPLEY, MD
Advisory members:
H. BERTON MCCAULEY, DDS

WILLIAM B. WEGLECKI, MD

REFERENCE COMMITTEE

Mr. President and Members of the House of Delegates:

Your Reference Committee met on Wednesday, March 29, 1967, to consider the five resolutions introduced by four individual members as well as by one component medical society. An unusually large number of persons was in attendance at our meeting and full discussion was entered into by all. As usual, the motions made will be on the resolution itself.

RESOLUTION 1A/67

Submitted on: June 28, 1966

Introduced by: Prince George's County Medical Society

Subject: Condemning Attempts by Insurance Carriers to Determine Qualifications of Physicians; and Requesting That Such Carriers Amend Their Regulations to Prevent This.

Whereas, Maryland Medical Service, Incorporated, indicates in its *Participating Physicians Manual*, at page 26 (Rev. 2-66) that benefits will be available to its subscribers for diagnostic x-ray services only when such services are performed by physicians conforming to certain criteria established by Maryland Medical Service, Incorporated; and

Whereas, The proper practice of medicine requires the exercise of all of a physician's skills and qualifications; and

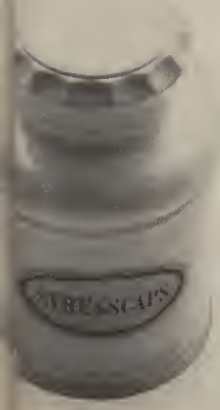
Whereas, The condoning of such regulation of medical practice by economic means may lead to further propagation of such restrictions, which are contrary to the best interests of the patient; and

Whereas, Such restrictions are not imposed upon Maryland physicians by licensure; now, therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland condemns any attempt by any insurance company to determine for its subscribers which duly licensed physician is qualified to perform what medical procedure and requests that all insurance carriers doing business in this State amend their regulations accordingly.

On April 28, 1959, the Council of the Faculty, in consultation with Maryland Medical Service, Inc., (Blue Shield) and the Maryland Radiology Society, took the following action:

1. *Specific Specialty:* The doctor confining his practice to a specific specialty (excluding general surgery, internal medicine and general practice) will be paid for diagnostic X-rays within the confines of such a specialty (example—orthopedics).
2. *General Surgery:* The doctor confining his practice to general surgery will be paid for diagnostic X-rays necessary in emergency traumatic cases.
3. *Internal Medicine:* (a) the doctor confining his practice to general internal medicine will be paid for diagnostic X-rays of the chest; (b) the doctor confining his practice to a *subspecialty of internal medicine*, such as thoracic diseases, joint diseases, or gastroenterological disease, will be paid for diagnostic X-rays within the confines of such a subspecialty.
4. *General Practice:* The doctor in general practice will be paid for diagnostic X-rays necessary in emergency traumatic cases and chest.
5. In rural areas and small communities where a radiologist is not available within approximately ten miles, consideration of payment for diagnostic X-rays will be given on an individual doctor basis. In most instances, this would be only for the diagnostic X-rays necessary in emergency traumatic cases.



ACTION: On motion duly made, seconded and carried, it was voted to approve the provision of Diagnostic X-ray coverage as suggested by the Maryland Medical Service, Inc., as amended by the above policy modifications, under Blue Shield policies only.

On November 18, 1965, the Council reaffirmed that this policy remain in effect. From this background informa-

in chronic illness

B and C vitamins are part of therapy: An imbalance of water-soluble vitamins and chronic illness often go hand in hand. STRESSCAPS capsules, containing therapeutic quantities of vitamins B and C, are formulated to meet the increased metabolic demands of patients with physiologic stress. In chronic illness, as with many stress conditions, STRESSCAPS vitamins are therapy.

Stresscaps®

Stress Formula Vitamins Lederle

FOR PROFESSIONAL
RECOMMENDATION ONLY

Each capsule contains:

Vitamin B_1 (as Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

When the battle with bacteria is in the G. U. tract

Artist's conception of acute infection
showing G.U. pathogens with predominance of *E. coli*.

consider Gantanol (sulfamethoxazole)

For vigorous treatment of G.U. infections before the invaders become entrenched... Gantanol (sulfamethoxazole) offers a comprehensive spectrum of antibacterial effectiveness against most common gram-negative as well as gram-positive invaders. In addition, it provides satisfactory concentrations in the blood and urine with ready diffusion to interstitial fluids for antibacterial activity at foci bacterial invasion.

gh antibacterial activity against *E. coli* and other mmon urinary pathogens... A review of 153 cases of ute G.U. infections reported in the literature shows that 90% responded to Gantanol (sulfamethoxazole), with over one-half of these patients showing excellent relief of symptoms.[1,2] Even in stubborn chronic G.U. infections, almost 60% of 450 patients improved on Gantanol (sulfamethoxazole), including many who had not responded to other antibacterials.[1-6]

Generally uncomplicated therapy enhances the favorable clinical results... Of the total 686 patients from the studies cited,[1-6] only three discontinued therapy because of side effects. Most of the side effects reported (approximately 3%) were mild and included nausea and/or vomiting, skin rash, dizziness, headache, gastritis, generalized uneasiness and itching.[1-6]

---

fore prescribing, please consult complete product ormation, a summary of which follows:

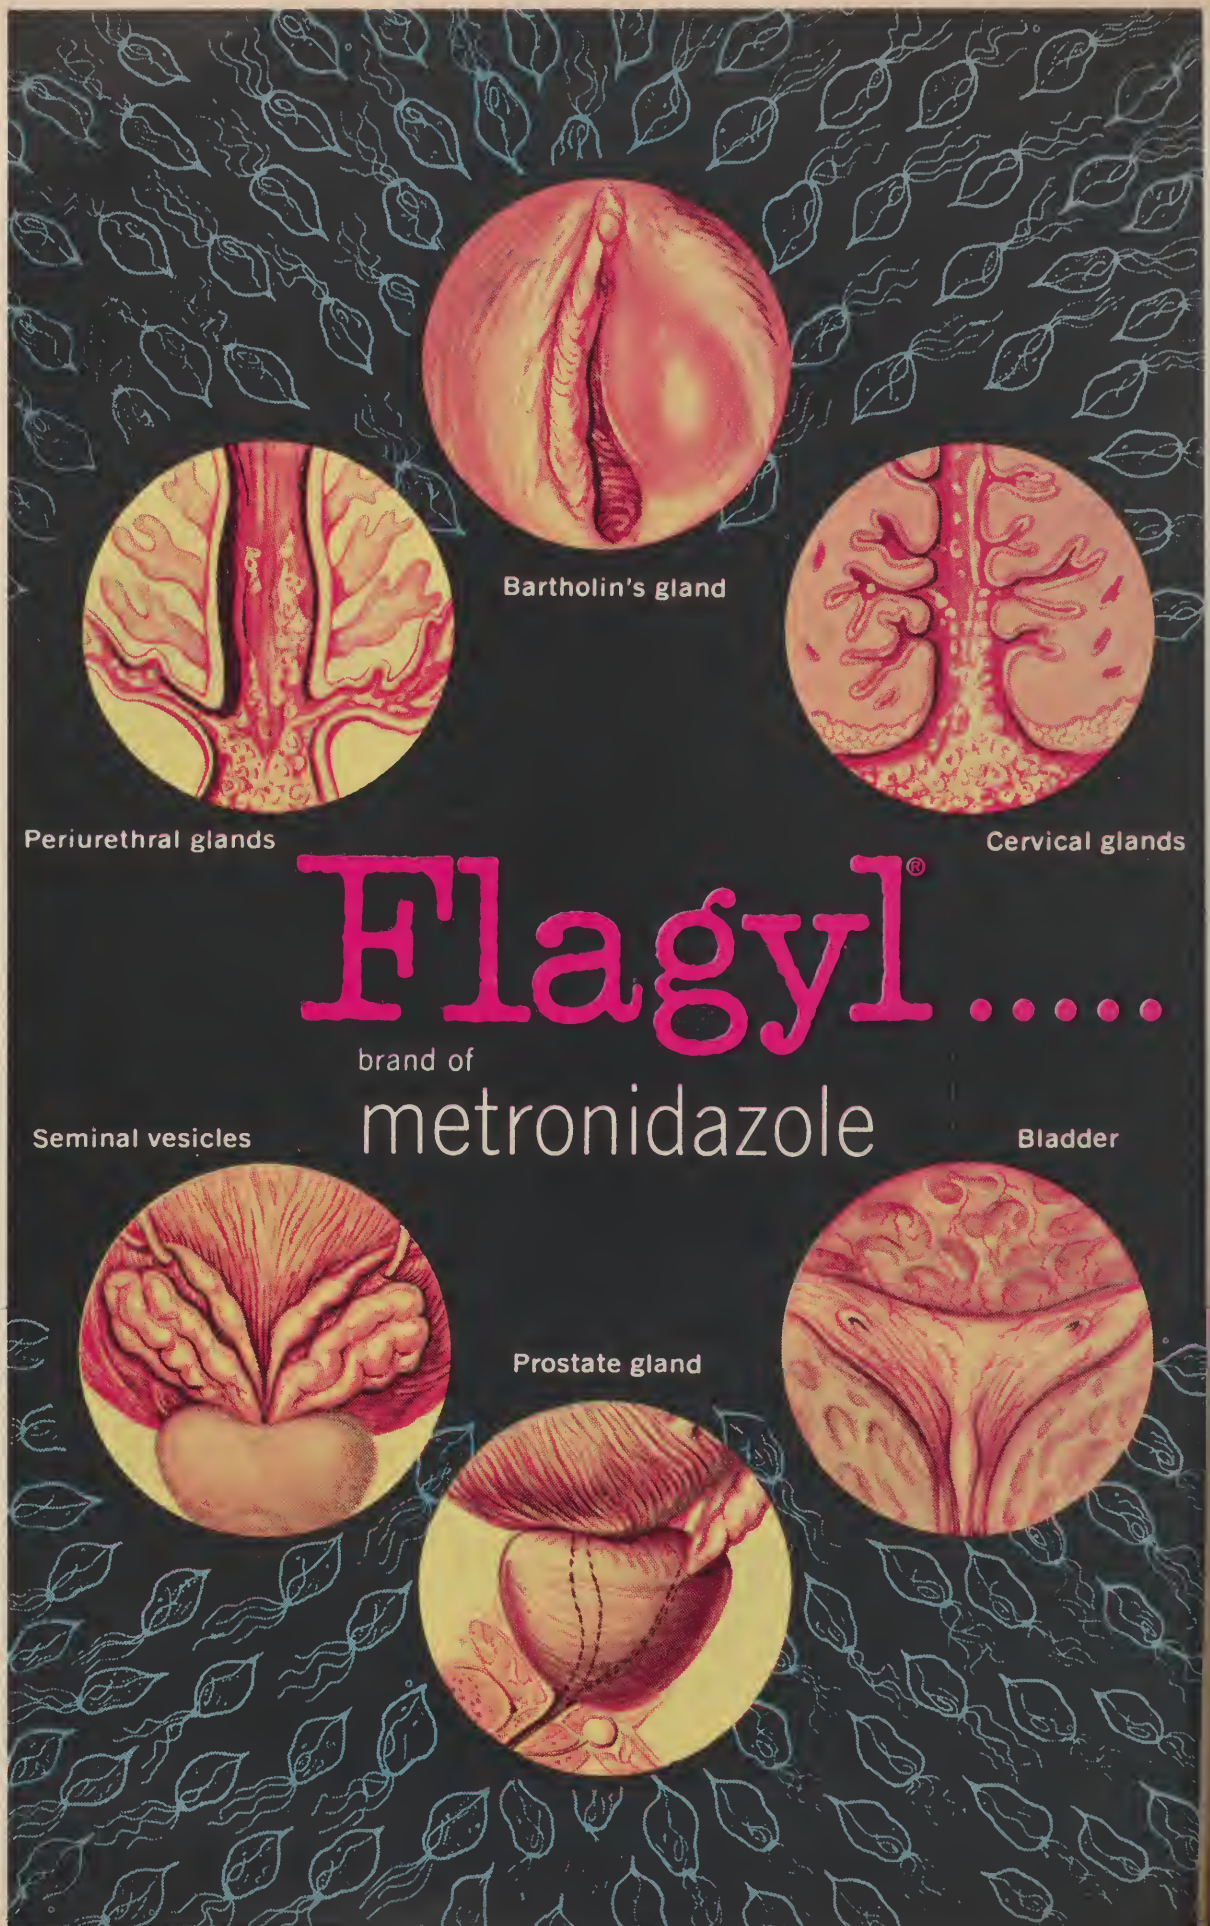
ntraindicated in sulfonamide-sensitive patients, gnant females at term, premature infants, or newn infants during first three months of life.

rnings: Use only after critical appraisal in patients n liver damage, renal damage, urinary obstruction lood dyscrasias. If toxic or hypersensitivity reacs or blood dyscrasias occur, discontinue therapy. In rmittent or prolonged therapy, blood counts and and kidney function tests should be performed.

autions: Observe usual sulfonamide therapy preions, including maintenance of an adequate fluid ke. Use with caution in patients with histories of gies and/or asthma. Patients with impaired renal tion should be followed closely since renal impairt may cause excessive drug accumulation. Occaal failures may occur due to resistant microorgan. Not effective in virus or rickettsial infections.

erse Reactions: Headache, nausea, vomiting, urtia, diarrhea, hepatitis, pancreatitis, blood dyscrason syndrome, injection of the conjunctiva and sclera, petechiae, purpura, hematuria or crystalluria may occur, in which case the dosage should be decreased or the drug withdrawn.

Dosage: Adults—4 tablets initially, then 2 tablets b.i.d. or t.i.d. depending upon severity of infection. Children —1 tablet/20 lbs initially, followed by ½ tablet/20 lbs b.i.d.



How Supplied: Tablets, 0.5 Gm, bottles of 50.

Destroys Trichomonads Wherever They Are

Flagyl seeks out the sites where trichomonads hide. Only a systemic agent can. Flagyl does, selectively and effectively.

Flagyl destroys trichomonads in the inner crypts, glands and cavities of the genitourinary tract in both women and men. Consequently, Flagyl is capable not only of curing trichomoniasis in women but also of preventing reinfection.

Correctly used, with due attention to repeat courses of treatment for resistant, deep-seated invasion and to the presumption of reinfection from male consorts, Flagyl has repeatedly produced up to 100 per cent cure in large series of patients.

When the diagnosis of trichomoniasis is positive, Flagyl is positive.

Dosage and Administration — In *women:* one 250-mg. oral tablet three times daily for ten days. A vaginal insert of 500 mg. is available for local therapy when desired. When used, one vaginal insert should be placed high in the vaginal vault each day for ten days; concurrently two oral tablets should be taken daily.

In *men* in whom trichomonads have been demonstrated: one 250-mg. oral tablet twice daily for ten days.

Contraindications — Pregnancy; disease of the central nervous system; evidence or history of blood dyscrasia.

Precaution—Complete blood cell counts should be made before, during and after therapy, especially if a second course is necessary.

Side Effects—Infrequent and minor side effects include nausea, metallic taste, furry tongue and headache. Other effects, all reported in an incidence of less than 1 per cent, are diarrhea, dizziness, vaginal dryness and burning, dry mouth, rash, urticaria, gastritis, drowsiness, insomnia, pruritus, sore tongue, darkened urine, anorexia, vomiting, epigastric distress, dysuria, depression, vertigo, incoordination, ataxia, abdominal cramping, constipation, stomatitis, numbness of an extremity, joint pains, confusion, irritability, weakness, flushing, cystitis, pelvic pressure, dyspareunia, fever, polyuria, incontinence, decreased libido, nasal congestion, proctitis and pyuria. Elimination of trichomonads may aggravate candidiasis.

SEARLE *Research in the Service of Medicine*

Did Dorothy Larson show you her ankles in private? Now she shows them in public.

Your office examination would have confirmed that Mrs. Larson was up to her knees in edema. Her heart was beginning to fail. And her ankles had disappeared under an inch of salty water.

Along with digitalis, you might have prescribed Hygroton. To get rid of the edema. And to keep it from coming back. And you prescribe Hygroton the same way you usually prescribe digitalis: just once a day.

Tablet for tablet, Hygroton is just about the most effective diuretic going. And it costs a fraction of what Mrs. Larson would have to spend for equivalent therapy with short-acting diuretics.

In fact, Hygroton is an awfully nice way to treat the Mrs. Larsons in your practice. Just tell them you can get their ankles back at half price.

Indications: Hypertension and many types of edema involving retention of salt and water.
Contraindications: Hypersensitivity and most cases of severe renal or hepatic disease.

Warning: With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind.
Precautions: Reduce dosage of concomitant antihypertensive agents by at least one-half. Discontinue if BUN rises or liver dysfunction is aggravated. Electr imbalance and potassium depletion may occur; ta special care in cirrhosis or severe ischemic heart d

patients receiving corticosteroids, ACTH, or digi-
alt restriction is not recommended.
fects: Dizziness, weakness, nausea, vomiting,
ycemia, hyperuricemia, headache, muscle cramps,
postural hypotension, constipation, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin reactions, including urticaria and purpura, epigastric pain, or G.I. symptoms after

Average Dosage: One tablet (100 mg.) with breakfast daily or every other day.
Availability: Tablets of 100 mg. 6524-V(B)
For full details, see prescribing information.

...so you might say Hygroton is good public relations for Mrs. Larson

Because it gets her *out* in public in the first place. At 43, Mrs. Larson worries about appearances and swollen ankles don't help.

But Hygroton's cosmetic effect is only half the story. Hygroton and digitalis therapy helps her get back in the swing of things. Gives her a second wind. Gets rid of the extra pillow she needed for a good night's sleep. Now she even likes to take walks. Just for the fun of it!

When her troubles began, Mrs. Larson thought they were the signs of the change of life. It's a change all right, but one you can treat. And you can count on Hygroton to help keep her in public instead of in the hospital.

See preceding pages for brief summary of prescribing information.

Geigy

Ardsley, New York

tion, it can be seen that little, if any, hardship is being developed by this policy determination.

In testimony heard before the Committee, it was ascertained that Blue Shield would find it extremely difficult to properly police the indiscriminate taking of X-rays.

We are in general agreement that third party carriers should not, on their own, establish criteria for payments of physicians under regulations issued by them. The criteria involved and mentioned in this resolution was developed in cooperation with the Faculty, representing the medical profession. It is not known of any other instance where Insurance Companies have developed such restrictions on their own. If any difficulties arise in this connection, they should be channeled through the Faculty's Mediation Committee.

We see no reason, therefore, to change the established policy in this regard.

Your Reference Committee recommends that this resolution *NOT* be adopted.

RESOLUTION 2A/67

Submitted on: January 9, 1967

Introduced by: M. B. Levin, MD

Subject: Authorizing the State Board of Medical Examiners, in Concert With Specialists, to Determine the Qualifications of Such Specialists; Providing for Election of the Board of Medical Examiners by Mail Ballot; Broadening the Powers of the Board of Medical Examiners to "Control and Regulate the Entire Practice of Medicine . . . in the State of Maryland"; and Making Other Recommendations Relating to Its Operation, Status and Composition; and Providing Certain Things That Are Now Governed By State Law or Regulation.

Whereas, The goal of the medical profession, ie, to obtain the highest possible standard of health and the greatest improvement of medical practice for the public's benefit, may finally be won through enabling the patient to have his own chosen doctor treat him at any institution he chooses (including hospitals), within the State limits; and

Whereas, This type of private practice of medicine is the objective of our Medical and Chirurgical Faculty; and

Whereas, Corporate Private practice of medicine is not permitted in Maryland; and

Whreas, Corporate control, intervention or denial in the private practice of medicine is not in the best interest of or for the benefit of the public's health and welfare; and

Whereas, Our laws regarding the public's health and welfare should be more definitive in this regard; and

Whereas, The medical profession being the only one having intimate and detailed knowledge of the requirements, standards and qualifications of the profession to practice medicine for the public's health and welfare; and

Whereas, The State authorizes only its State Board of Medical Examiners in cooperation with the Medical and Chirurgical Faculty and the profession, to qualify, license, regulate and control the practice of medicine throughout Maryland; now, therefore, be it

Resolved, That the Legislature authorize only the State Board of Medical Examiners to be so constituted as to enable it to thoroughly accomplish its purpose and fully assume its sole activity and responsibility, and thereto enact the following:

There shall be a Maryland State Board of Medical Examiners composed of at least eight (8) active members and it shall have such powers, duties, officers and meetings as are provided from time to time by law. This Board shall be so constituted as to qualify and license not only new members of the profession, but also be assisted in determining the qualifications of members in the Specialties by corresponding Specialists in their respective fields, with the advice and approval of the entire profession in the State.

The Maryland State Board of Medical Examiners shall be elected by a majority vote of the general voting membership of the Medical and Chirurgical Faculty of Maryland and other eligible doctors in good standing in the State, voting by secret ballot through the mail.

One-fourth of the members of the Board of Medical Examiners shall be nominated one month before the annual election of officers and delegates by the nominating committee of the House of Delegates; and, additional nominations may be made at a corresponding time by physicians in good standing at component society meetings, from the floor. These nominations shall be circulated to the entire general voting membership of the Medical and Chirurgical Faculty and be available to all physicians in good standing in the State; and, election of the members of the Board of Medical Examiners (as well as delegates and other officers) shall be by secret ballot through the mail. The elected Board members shall serve for a term of four years, or until their successors are elected and qualified, beginning on the first day of June following their election, or as provided by law.

The State Board of Medical Examiners and its Qualifying and Disqualifying Boards shall be so constituted and after due process of consultation, with the advice and assistance of the Medical and Chirurgical Faculty; and, in compliance with parliamentary procedure and statutory laws and medical ethics, shall have the sole and complete authority and responsibility to qualify, disqualify, license, control and regulate the entire Practice of Medicine, Surgery and the Specialties, everywhere and anywhere in the State of Maryland; and, no other bodies, including individuals, hospitals or other corporations, groups, or branches of Government, shall have authority and responsibility to qualify, disqualify, license, control, regulate, deny, interfere with or intervene in the above, directly or indirectly, without specific definitive legislation to that effect, as noted at present relative to the Health Commissioners.

The State and its components shall not be contractual parties with or give tax suppored financial or subsidized aid in any form to any hospital, institution or other corporation, or group participating in medical practice which denies the State Board of Examiners' properly qualified and licensed doctors in good standing, the use of their beds and facilities for their private practice of medicine.

If financial support or subsidy, including a tax-free status, is granted to such a body; and, it in turn in its contracts with hospitals or other institutions, bodies or groups, permits discrimination against doctors in good standing and refuses them the right to practice on their private patients by denying them access to the beds and facilities; or, requires of the doctors signed applications to abide by the hospital or corporate bylaws and control of the practice of medicine; state contracts, financial support, subsidy or tax-free status shall be cancelled.

Your Reference Committee heard comments from the Board of Medical Examiners as well as Dr. Levin and others.

It was of the opinion that this resolution involves too many suggestions and proposals involving policy matters both of the Board of Medical Examiners and the medical profession itself. In addition, it would require substantial changes in the laws of the State of Maryland.

It is, therefore, recommended that this resolution *NOT* be adopted.

RESOLUTION 3A/67

Submitted on: February 2, 1967

Introduced by: George Vash, MD

Subject: Closing of All Well-Baby Clinics and Transfer of Patients to Private Physicians

Whereas, Medicaid extends full benefits to our indigent people in Maryland; and

Whereas, The best care of the growing infant and child can be given by the family physician or pediatrician, who can watch the child in its good and bad days, and develop a personal relationship with the child and the family which will enable him to treat the child better if sickness develops; and

Whereas, It seems that the so-called well baby clinics, which specialize in administering immunizations and observing growth of the normal child, have no more justification and no further part to play although the contributions of these clinics in the past, when indigent mothers had difficulty obtaining services of private physicians, were outstanding; now, therefore, be it

Resolved, That the Medical and Chirurgical Faculty go on record favoring closure of all well baby clinics and transfer of their patients to private physicians.

Unfortunately, Dr. Vash was unable to attend the Reference Committee hearing. It was also learned that there is a continuing shortage of both Pediatricians and General Practitioners available to take care of children, particularly in the areas where such Well-Baby clinics are operated. If the Well-Baby clinics were closed, existing clinical facilities to which these patients could turn would be overtaxed. Efforts are being made to increase such services through community programs and this resolution was thought to be premature in its concept of a "personal relationship."

It is recommended, therefore, that Resolution 3A/67 *NOT* be adopted.

RESOLUTION 4A/67

Submitted on: February 22, 1967

Introduced by: Robert L. Cavenaugh, MD

Subject: Urging Faculty Members to Use the Democratic Processes for Correction of Impropriety in any Laws, Rules or Regulations; and Obey Any Such Laws Until They are Properly Changed

Whereas, The progressive development of individua's and communities requires freedom from infringements against life, liberty and pursuit of happiness; and

Whereas, To assure freedom from such infringements, Governments and Governing bodies, with the consent of the governed, properly enact laws, rules and regulations; and

Whereas, Disrespect to law and order, and disobedience of properly enacted laws, rules and regulations leads to demoralization of individuals and deterioration of civilized communities; now; therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland hereby reaffirms its wholehearted support of all properly enacted laws, rules and regulations, and encourages its members to respect and obey them, demonstrating to their fellow-citizens, particularly the youthful, an example of obedience to the letter and spirit of the laws of the land; and be it further

Resolved, That the members of the Medical and Chirurgical Faculty of the State of Maryland, individually and collectively, hereby state, that whenever any law, rule or regulation comes to their attention as being probably improper or probably not conducive to the progressive development of citizens or communities, it is their intent to bring about correction of such impropriety through the democratic processes which represent the proud heritage of American citizens, but to obey such directives until they are properly changed.

The medical profession has consistently used the existing democratic processes for the purpose of modifying or changing any laws, rules or regulations, when it considers them not in the best interests of the health of the people of Maryland. At times, such regulations or laws are promulgated despite the profession's concern over the effect they might have. Nonetheless, they become the law of the State or the Country and as such should be properly obeyed.

In these days of world-wide turmoil we believe it is well to reiterate this policy. **Your reference Committee, therefore, recommends that Resolution 4A/67 be adopted.**

RESOLUTION 5A/67

Submitted on: February 22, 1967

Introduced by: Timothy D. Baker, MD, Baltimore City

Subject: Reiteration of the Faculty's Policy to Assist the State Health Department in Maintenance of High [Ethical] Standards in Maryland's Title 19 Medical Care Program

Whereas, The Medical and Chirurgical Faculty of the State of Maryland has shown, [through its Mediation Committee and its Health Insurance Review Subcommittee,] its deep continuing concern with the maintenance of high [ethical] standards of medical practice, thus ensuring public confidence in the medical profession; and

Whereas, Some State Title 19 medical care programs have reported questionable practices that might diminish public confidence in the medical profession; now, therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland take the initiative and reiterate again the Faculty's offer of assistance to the State Health Department in the maintenance of high [ethical] standards of medical practice in the provision of medical services through Maryland's Title 19 program of medical assistance.

This resolution is self-explanatory. There presently exist mechanisms for the proper adjudication of difficulties that might arise with physicians in the operation of the Title 19 program (Medicaid). The Society reemphasizes the medical profession's willingness to assist in the maintenance of high standards of care to recipients under this program.

Your Reference Committee, therefore recommends the adoption of Resolution 5A/67, as amended by striking the words in the resolution that are bracketed. The author of this resolution concurs in the deletion of these words.

In closing, your Committee would like to express appreciation and thanks to those who helped in its deliberations and to the staff who assisted in the preparation of this report.

Respectfully submitted,
Everett S. Diggs, MD, *Chairman*
Howard F. Kinnamon, MD
Herbert H. Leighton, MD
DeWitt E. DeLawter, MD
Lawrence R. Wharton, Jr., MD

SUPPLEMENTAL REPORT OF THE TREASURER

Mr. President and Members of the House of Delegates:

The audited report of the financial affairs of the Faculty for the year 1966 and the 1967 budget are presented for your information and as a matter of record in accordance with the Bylaws. I am pleased to report that the Faculty is in sound financial condition.

Your particular attention is invited to the Restricted Fund Statement. These funds are controlled by your Treasurer with the assistance of the Finance Committee, which has submitted its own report to you.

There have been two substantial additions to the Faculty's Designated Funds since the date of these Financial Statements. The assets of the Walter Ralph Steiner Trust are being transferred to the Faculty as remainderman in the will of Dr. Steiner. The Fund will be known as the Lewis Henry Steiner Fund as the will directs, and the income from the fund may be used for the purchase of Library books and journals. Mrs. J. Mason Hundley, Jr., has added $3,000 to the J. Mason Hundley, MD, Lecture Fund with the request that the total fund be known as "The Hundley Memorial Lecture in Gynecology." We are very grateful to Mrs. Hundley and will comply with her request.

I shall be glad to answer any questions you might have.

Respectfully submitted,
Karl F. Mech, MD, *Treasurer*

TREASURER

Mr. President and Members of the House of Delegates:

The 1967 budget and the report on the affairs of the Medical and Chirurgical Faculty for the year of 1966 are presented for your information and as a matter of record in accordance with the Bylaws.

EXPLANATORY NOTES ON 1967 PROPOSED BUDGET

Budgetary items for 1967 are predicated on actual cost for 1966. Only items where there is a substantial change will have explanatory notes.

A. Contributions:

National SAMA	$100.00
Student AMA, Maryland Chapter	250.00
National Society for Medical Research	50.00
Miscellaneous (Maryland League for Nursing)	300.00
	$700.00

B. Salaries:

Reflected in this figure are anticipated salary increments during 1967, plus offsetting amounts shown under receipts from Faculty's Insurance Trust and the Baltimore City Medical Society for services of its employees on Faculty payroll.

C. Travel:

The following items are budgeted for travel during 1967:

Professional Convention Management Association and Medical Exhibitors Association, Washington, D. C., January 9-12, 1967 One Staff Member

National Congress on Socio-Economics of Health Care, Chicago, Illinois, January 20-21, 1967 One Staff Member

Annual Medicolegal Conference, Miami, Florida, March 9-11, 1967 One Staff Member

Medical Society Executives Assn. (1 Day) and AMA Annual Meeting (5 Days), Atlantic City, N. J., June, 1967 One Staff Member, Three Delegates, Senior Alternate Delegate

Medical Society Executives Assn. (1 Day) and AMA Annual Institute (2 Days), Chicago, Illinois, August, 1967 Two Staff Members

American Medical Association House of Delegates (4 Days), Houston, Texas, December, 1967 One Staff Member, Three Delegates, Senior Alternate Delegate

Journal:

State Medical Journal Advertising Bureau Meeting, Chicago, Illinois, October, 1967 One Staff Member

American Medical Writers' Assn. Meeting, Chicago, October, 1967 One Staff Member

Library:

Advisory Board, Special Libraries Assn., Houston, Texas, January 18, 19, 20, 21, 1967 One Staff Member

Special Libraries Assn. Annual Meeting, New York, May 29-June 3, 1967 One Staff Member

Medical Library Association Meeting, Miami, Florida, June 5-9, 1967 One Staff Member

Regional Medical Library Assn., Washington, D. C., Fall, 1967 Two Staff Members

Any TRAVEL for which the Faculty is reimbursed by the AMA or other affiliated, allied or associated groups is approved without reference to the Executive Committee.

D. Legislative:

Operation of Legislative First Aid Room	$1,000.00
Distribution of Legislative Newsletter (5 issues)	2,000.00
Copies of legislation	200.00
Legislative Representatives expenses (Travel, meals, telephone, etc.)	500.00
Expenditure for Federal legislation	800.00
Legal services for preparation and analysis of proposed legislation	500.00
	$5,000.00

E. Library Expenses:

Total per Library Budget	$30,000.00
Less: Amount included in Salaries Account	25,000.00
Library Expense of General Fund	$5,000.00

Journal subscriptions, books, and binding are not included in above, but are purchased out of income from specific fund for Library purposes.

Light, heat, telephone, payroll taxes, etc., are also excluded.

Respectfully submitted,
KARL F. MECH, MD, Treasurer

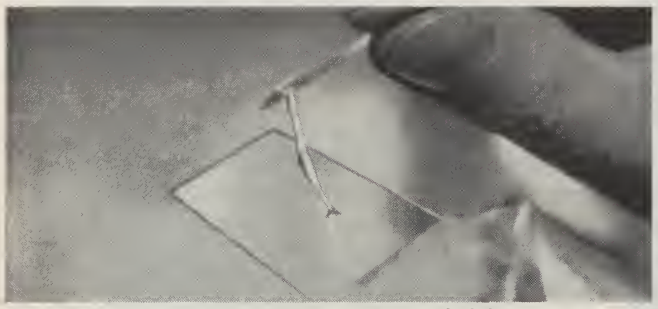
New view of an oral contraceptive at work

Although suppression of ovulation remains the primary mode of action of oral contraceptives, newer knowledge indicates that products like Norinyl-1—which provide the combined action of both low-dosage progestogen and estrogen for the full treatment cycle—offer multiple contraceptive action that helps explain their unexcelled record of effectiveness. This report explores the secondary protective mechanisms against unwanted pregnancy offered by combined hormonal administration and the importance of the progestational agent in making such multiple contraceptive action possible.

Accumulating evidence has indicated that sparse, highly viscous cervical mucus has an adverse effect on the motility and survival of spermatozoa.

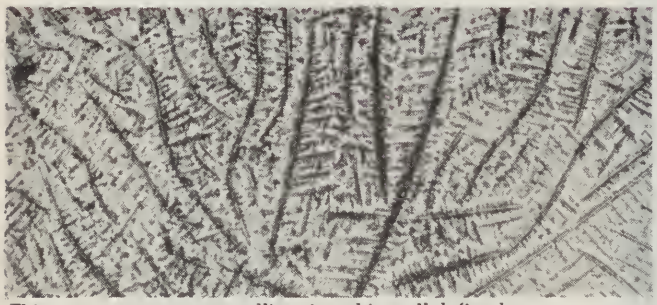
The estrogen-opposing progestational ingredient of Norinyl-1 (norethindrone 1 mg. with mestranol 0.05 mg.) reverses the usual midcycle picture of a thin, watery cervical mucus. The result—a built-in barrier that inhibits sperm from reaching the ovum should one be released. The inset in the adjoining photograph shows immobile spermatozoa as they appear in cervical mucus taken from a patient treated with Norinyl-1.

See last page for contraindications, precautions, side effects and dosage.



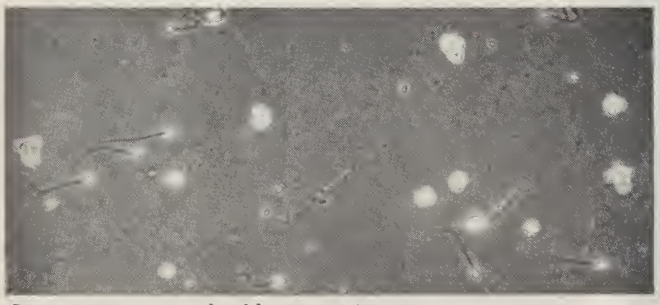
How the estrogen-opposing action of Norinyl-1 creates a hostile cervical mucus

Normally estrogen activity during the fertile midcycle stimulates the production of cervical mucus. The mucus at this time is profuse and watery—allowing maximum sperm motility and promoting penetration.
But what happens when Norinyl-1 is administered? Its potent progestogen, norethindrone, opposes estrogen stimulation of cervical mucus. Consequently, the amount of mucus decreases and its viscosity increases. This results in a sparse but thick mucus barrier that diminishes the vitality of the sperm and impairs its powers of penetration.



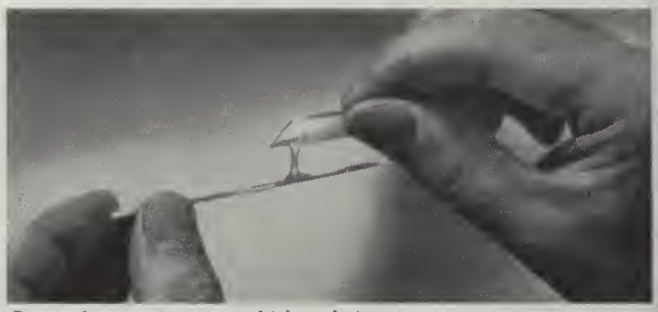
How hostile cervical mucus supports contraceptive action

The importance of these observations to the effectiveness of Norinyl-1 has been noted in a report on 89 patients taking this medication.* In all instances, cervical mucus obtained from cycle day 5 to cycle day 29 appeared scant and thick and exhibited little or no Spinnbarkeit. In the opinion of this investigator, the effect on cervical mucus may be sufficient to prevent conception. *Symposium on Low-Dosage Oral Contraception, Palo Alto, Calif., July 15, 1965.

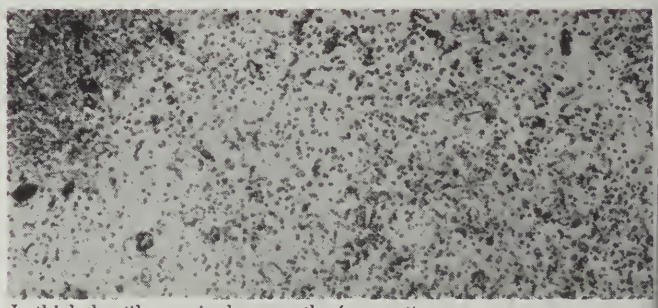


Normal cervical mucus at midcycle in untreated patient permits sperm motility... promotes sperm penetration.

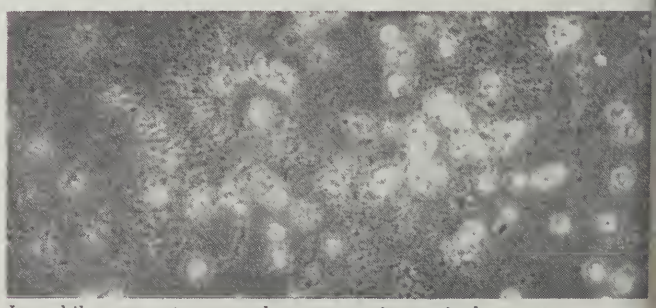
Cervical mucus is thin and watery with a stretchability (Spinnbarkeit) of 15 to 20 cm.



Thin, watery mucus crystallizes into this well-defined, fernlike pattern within a minute.



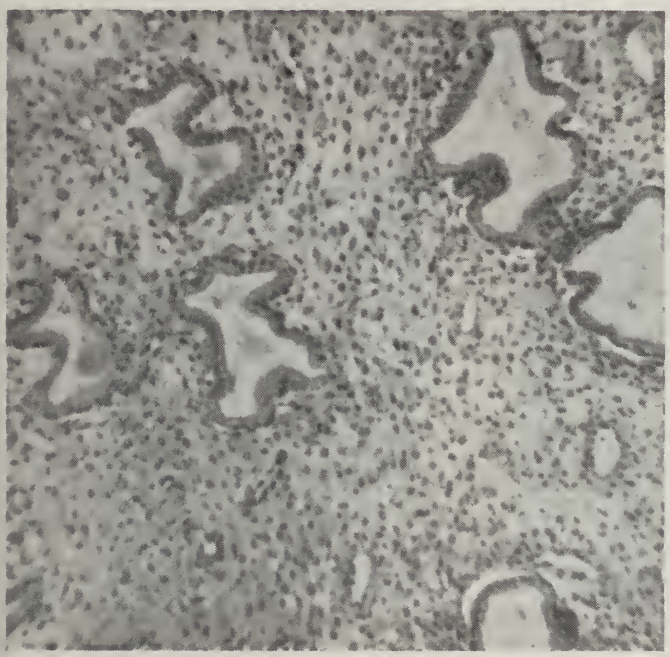
Spermatozoa appear healthy, are active and free moving.



Hostile cervical mucus at midcycle produced by Norinyl-1 impairs sperm vitality... inhibits penetration.

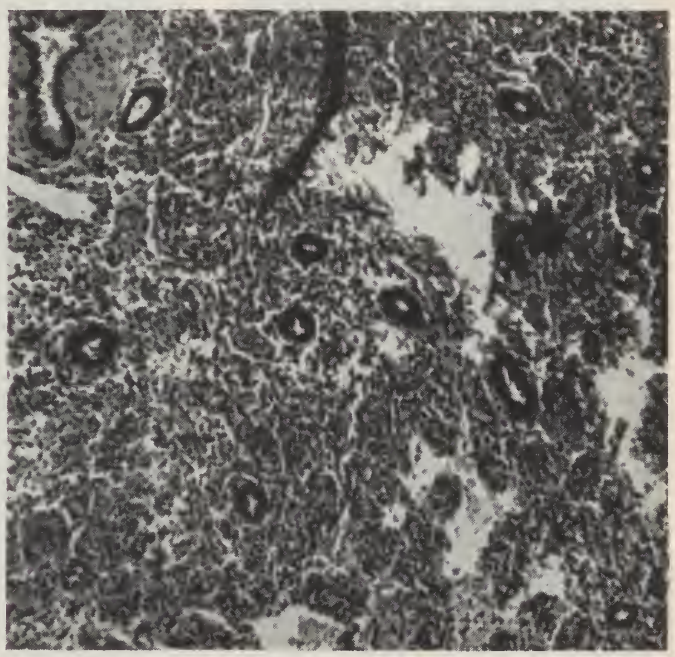
Cervical mucus is scanty, thick and viscous. Spinnbarkeit is 1 cm. or less.

In thick, hostile cervical mucus the fern pattern is poorly defined or absent.



Immobile spermatozoa as they appear in cervical mucus taken from a patient treated with Norinyl-1.

An endometrium unreceptive to nidation– another supporting contraceptive action of Norinyl-1



Let us suppose that an ovum is released—as occurs in an occasional, rare case—and somehow a sperm succeeds in penetrating the cervical mucus barrier? Should this come about, one additional action of Norinyl-1 may protect the patient from unwanted pregnancy—progestogen intake makes endometrial tissue unreceptive to implantation.

Endometrium of untreated patient

Normally the endometrium progresses through a proliferative phase stimulated by estrogen and a secretory phase stimulated by progesterone. During the secretory phase the endometrium is receptive to the fertilized ovum.

Unreceptive endometrium produced by Norinyl-1

When Norinyl-1 is administered its progestogen component—norethindrone—accelerates the secretory phase, suppressing glandular development. From day 11 on, secretory action is no longer present. The result is that during the latter half of the cycle the endometrium becomes unreceptive to egg implantation.

new Norinyl®-1 tablets

(norethindrone 1mg. c̄ mestranol 0.05mg.)

Reduction of oral contraceptive dosage to lowest effective levels has become a well-accepted principle of conservative medical practice. In keeping with this view, Norinyl is now available in a new strength in which *both* norethindrone and mestranol are reduced 50 percent. Studies show that Norinyl-1 achieves fertility control with only 1.05 mg. of combined progestogen and estrogen per tablet.

Norethindrone was first reported for use as a progestational agent in human beings in 1955. Norethindrone 2 mg. with mestranol 0.1 mg., as an oral contraceptive, is currently in use by over 2,000,000 women. Clinical experience now establishes that Norinyl-1 also amply meets the criteria of reliability and safety.*

*Symposium on Low-Dosage Oral Contraception, Palo Alto, Calif., July 15, 1965.

PRESCRIBING INFORMATION

Contraindications: 1. Patients with thrombophlebitis or with a history of thrombophlebitis or pulmonary embolism. 2. Liver dysfunction or disease. 3. Patients with known or suspected carcinoma of the breast or genital organs. 4. Undiagnosed vaginal bleeding.

Warnings: 1. Discontinue medication pending examination if there is sudden partial or complete loss of vision or if there is a sudden onset of proptosis, diplopia, or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. 2. Since the safety of Norinyl-1 in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. 3. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this dose to the infant has not been determined.

Precautions: 1. The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. 2. Endocrine and possibly liver function tests may be affected by treatment with Norinyl-1. Therefore, if such tests are abnormal in a patient taking Norinyl-1, it is recommended that they be repeated after the drug has been withdrawn for 2 months. 3. Under the influence of estrogen-progestogen preparations, preexisting uterine fibroids may increase in size. 4. Because these agents may cause some degree of fluid retention, conditions that may be influenced by this factor, such as epilepsy, migraine, asthma, cardiac, or renal dysfunction, require careful observation. 5. Although a cause and effect relationship has not been established, Norinyl-1 should be used with caution in patients with a history of cerebrovascular accident. 6. In relation to breakthrough bleeding, as in all cases of irregular bleeding *per vaginam*, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. 7. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. 8. Any possible influence of prolonged Norinyl-1 therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. 9. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Norinyl-1 therapy. 10. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. A cause and effect relationship has not been demonstrated. 11. Because of the effects of estrogens on epiphyseal closure, Norinyl-1 should be used judiciously in young patients in whom bone growth is not complete. 12. The age of the patient constitutes no absolute limiting factor, although treatment with Norinyl-1 may mask the onset of the climacteric. 13. The pathologist should be advised of Norinyl-1 therapy when relevant specimens are submitted.

Side Effects: The following adverse reactions have been observed with varying incidence in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms, breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma, breast changes (tenderness, enlargement and secretion), loss of scalp hair, change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately postpartum, cholestatic jaundice, erythema multiforme, erythema nodosum, hemorrhagic eruption, migraine, rash (allergic), itching, rise in blood pressure in susceptible individuals, mental depression.

The following occurrences have been observed in users of oral contraceptives. A cause and effect relationship has not been established: thrombophlebitis, pulmonary embolism, neurooocular lesions.

The following laboratory results may be altered by the use of oral contraceptives: increased bromsulphalein retention and other hepatic function tests, coagulation tests (increase in prothrombin, factors VII, VIII, IX and X), thyroid function (increase in PBI and butanol extractable protein-bound iodine and decrease in T^3 values), metapyrone test, pregnanediol determination.

Other side effects reported to have occurred in association with use of this drug are dizziness, hirsutism, pains in legs, back, chest and abdomen, dysuria, drowsiness, vaginal discharge, libido increased and decreased, eruptions, hypermenorrhea, hypomenorrhea, increased appetite, G.U. infections, varicose veins, abdominal fullness, acne, headache, nervousness, allergies, blurred vision, pain in eyes, and itching in eyes. *For complete clinical data, see package insert.*

Dosage and Administration: 1. One tablet of Norinyl-1 is administered orally for 20 days beginning on day 5 of the menstrual cycle. (Count day 1 of the cycle as the first day of menstrual bleeding.) Repeat this dosage schedule for each cycle. 2. If no menstrual period occurs after a cycle of treatment (20 tablets) in which patient adhered to the schedule, the patient must be instructed to resume taking the Norinyl-1 tablets 7 days after the previous 20 day course was completed. For example, if the last pill of a previous cycle had been taken on a Sunday, then a new cycle of treatment should begin on the following Sunday. 3. In the postpartum woman, it is recommended that the first cycle of treatment should begin on day 5 of the first menstrual cycle. However, Norinyl-1 should not be administered during lactation.

Availability: Norinyl-1 (norethindrone 1 mg with mestranol 0.05 mg.)—Dispensers of 20 and 60 and bottles of 250 tablets.

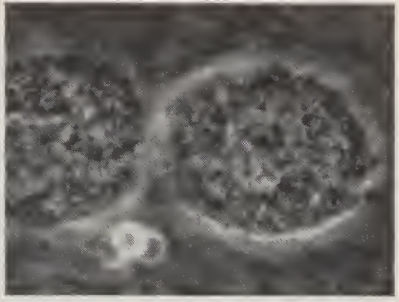
INFLAMMATION:
A cellular fight for life

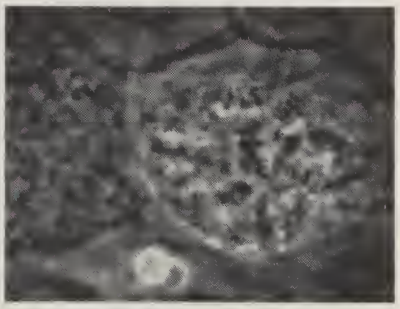
A SYNTEX REPORT based on recently developed hypotheses about topical corticosteroids, including the cellular theories of inflammation by Thomas F. Dougherty, Ph.D., University of Utah.

You are looking at a fibroblast fighting for life. This cell—one of the most common found in connective tissue—has literally been poisoned by cytotoxins released from other cells that have ruptured. Soon, if the abnormal activity of this fibroblast does not cease, it, too, will rupture and die—one more casualty in the inflammatory wave of destruction precipitated by injury.

Until a short time ago no one had ever witnessed such a scene at the cellular level. Now, through advanced cinemicrographic techniques, it is possible to view and photograph the inflammatory process as produced experimentally in living animal tissue. This method permits new insight into the mechanism of inflammation and the role of corticosteroids in therapeutic management. Equally important, these techniques shed new light on factors that may make one corticosteroid more effective than another—factors that can be correlated with other chemical, biologic, and clinical parameters.



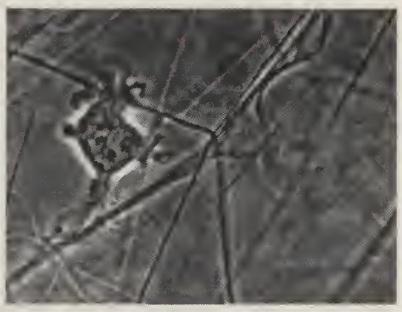
Visual evidence of how corticosteroids influence the inflammatory reaction



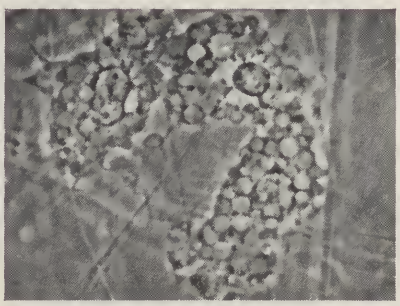
Working with phase-contrast cinemicrography on living animal tissue, Doctors Thomas F. Dougherty and David Berliner of the University of Utah College of Medicine have actually filmed cellular events that occur during the inflammatory reaction. This remarkable study* and additional work by these investigators, as well as by others, have established a new theoretical biologic basis for the antiinflammatory effect of the corticosteroids. (It must be noted that other theories, such as the lysosome or so-called "suicide bag" theory, have been postulated, although it is quite likely that there are more similarities than differences among the various theoretical models.)

The inflammatory wave of destruction

In this investigation an injurious injection of gelatin is used to set off an inflammatory reaction in living mouse tissue. What follows is a wave of destructive cellular activity that comprises the inflammatory response to injury. Mast cells (which contain heparin, serotonin and histamine) take up water, swell and rupture, releasing their contents, which are toxic outside the mast cell wall. These toxins, in turn, cause disintegration of other cells (such as fibroblasts) and the release of additional toxic material. Capillaries, too, take up water and leak unformed blood elements, causing edema. And polymorphonuclears, lymphocytes and perithelial cells invade the inflamed site. As a result of all these changes, the cellular environment reaches a state of turmoil.

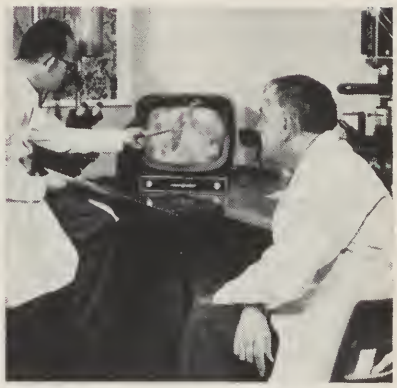


Phase-contrast microscopy showing mast cell before injury.



Mast cell (after injury) has broken up and released cytotoxins.

How corticosteroids change the picture



Corticosteroids appear to virtually stop the abnormal cellular activity that constitutes the inflammatory reaction. This permits the body's natural resources to clear up the inflamed area and repair the damaged tissue. This interpretation is supported by the fact that when the injurious gelatin solution is injected simultaneously with a corticosteroid – Synalar (fluocinolone acetonide) – the inflammatory pattern simply does not develop.

Fibroblast in high state of activity, much distorted.

Mast cells showing effects of corticosteroid action: cells are normal in size, shape and activity.

In summarizing his study Doctor Dougherty states: "...we also feel this work may explain why one corticosteroid helps a patient more rapidly and effectively than another. If it does, it is because one corticosteroid is the fastest, most effective inhibitor of the series of inflammatory events at the tissue level."

A New View of Corticosteroid Action in Inflammatory Dermatoses, a film based on this study, is now available from your Syntex representative.

See last page for contraindications, precautions, side effects and dosage.

Worldwide clinical experience confirms the predictable therapeutic potential of Synalar

It is particularly gratifying that the promise of the advanced chemical design and high order of bioassay activity of Synalar (fluocinolone acetonide) has been confirmed by widespread therapeutic application. Indeed, the impressive clinical response rate of Synalar has been documented in no fewer than 232 papers from 22 countries.

Representative Clinical Results with Synalar*

Efficacy Documented in over 4,000 Patients

Condition	Number of Publications	Number of Patients	Significant Improvement†
Contact Dermatitis	27	750	713
Eczematous Dermatitis	21	472	409
Seborrheic Dermatitis	18	442	426
Atopic Dermatitis	24	460	426

Neurodermatitis	18	351	324
Total	144	4,174	3,808

*Complete bibliography on request.

†Expressed by the authors as excellent, very good, good, complete remission of inflammation, etc.

PRESCRIBING INFORMATION

For initiation of therapy: Cream 0.025%, 5 and 15 Gm. tubes, 425 Gm. jars; *for emollient effect:* Ointment 0.025%, 15 Gm. tubes; *for maintenance therapy:* Cream 0.01%, 15 and 45 Gm. tubes, 120 Gm. jars; *for intertriginous or hairy sites:* Solution 0.01%, 20 cc. and 60 cc. plastic squeeze bottles; *for infected inflammatory dermatoses:* Neo-Synalar® Cream (0.025% fluocinolone acetonide, neomycin sulfate, equivalent to 0.35% neomycin base), 5 and 15 Gm. tubes.

CONTRAINDICATIONS: Tuberculous, fungal, and most viral lesions of the skin, (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of the components. PRECAUTIONS: Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. Prolonged use of any antibiotic may result in overgrowth of nonsusceptible organisms; if this occurs, appropriate therapy should be instituted. When severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. SIDE EFFECTS: Side effects are not ordinarily encountered with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. The neomycin in Neo-Synalar Cream rarely produces allergic reactions.

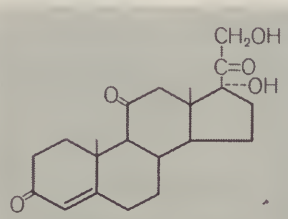
fluocinolone acetonide — an original steroid from

SYNTEX LABORATORIES INC., PALO ALTO, CALIF.

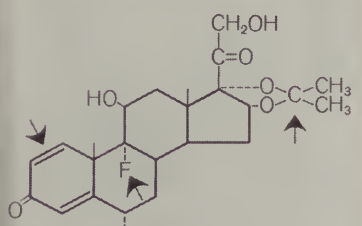
For inflammatory dermatoses... by any measure a topical corticosteroid of choice

Synalar® (fluocinolone acetonide)



Milligram for milligram one of the most active topical corticosteroids available

Rapid and predictable in antiinflammatory and antipruritic activity

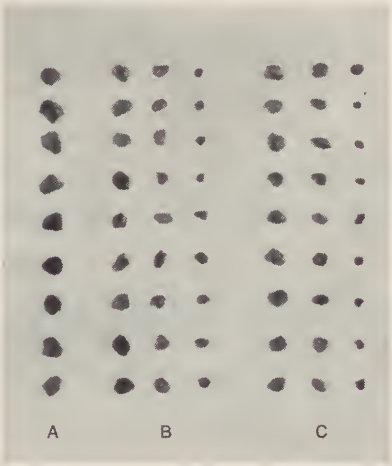


Results often comparable to those of systemic corticosteroids with fewer hazards

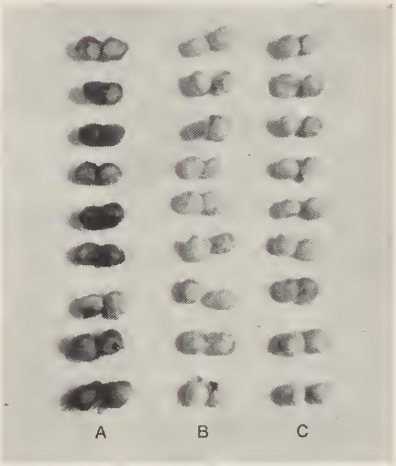
How advances in chemical design have achieved greater steroid potency

The chemical modification of corticosteroid molecules from the advent of hydrocortisone to the development of Synalar (fluocinolone acetonide) is a prime example of how biochemists can "design" to increase therapeutic activity and minimize undesirable side actions. Below, for example, we see the important changes that were made in reference to the hydrocortisone molecule to produce fluocinolone acetonide, one of the most active of all topical corticosteroids. As a result, a 0.01% preparation of Synalar (fluocinolone acetonide) has been reported to do the work of a 1% hydrocortisone product containing 100 times more cortiscosteroid. And it can often do it more effectively.

Hydrocortisone



Fluocinolone Acetonide (Synalar)



- *a double bond between carbons 1 and 2*
- *fluorine substitutions at* both *the 6-α, and the 9-α positions*
- *the addition of the acetonide at the 16-α, 17-α positions, thus providing one of the most potent topical corticosteroids available.*

How bioassay tests are used to "predict" therapeutic potential

Biologic assays are another tool used by researchers to help establish the relative activity of corticosteroids. To date no single method of assaying corticosteroid activity has emerged as the ideal "yardstick" for predicting therapeutic potential. Taken together, however, these methods have proved useful. When such tests are run on various corticosteroids, a definite order of corticosteroid activity becomes evident. Compounds with the highest order of activity may be expected to merit clinical trial to establish their high therapeutic potential. When assayed by these methods, fluocinolone acetonide (Synalar) emerges as one of the most active topical corticosteroids, milligram for milligram, available for clinical application today.

THE THYMUS INVOLUTION ASSAY[1-4] is run on adrenalectomized rats. The sizes of the glands are measured, and the degree of involution caused by the steroid is determined as an indication of its potency. In the above photo, the comparative involution of thymus glands achieved with hydrocortisone and Synalar (fluocinolone acetonide) is shown. Untreated controls (A) show normal size. Group B—injected with 1, 2 and 4 mg. of hydrocortisone—show progressively smaller thymuses as does Group C—injected with fluocinolone acetonide—but with only 1/500th the dose of hydrocortisone.

THE ANTIGRANULOMA ASSAY[1-4] also utilizes adrenalectomized rats. Granulomas are induced by subcutaneous implantation of cotton pellets on either side of the thorax. The degree of granuloma inhibition achieved by a steroid reflects its potency. The above photo shows the inhibition of granuloma formation achieved with hydrocortisone and Synalar (fluocinolone acetonide). Untreated controls (A) show large, red granulomas adhering to the pellets. Group B, receiving hydrocortisone and Group C, receiving fluocinolone acetonide, show little, if any, granuloma formation. Fluocinolone acetonide produced the same effect as hydrocortisone with only 1/500th the dose. This assay, as well as the thymus involution assay, measures systemic rather than topical corticosteroid activity. Nevertheless, results by these methods correlate well with other assays and with the milligram potencies of topical steroids in current clinical use.

THE MEDICAL AND CHIRURGICAL FACULTY
OF THE STATE OF MARYLAND,
1211 CATHEDRAL STREET,
BALTIMORE, MARYLAND 21201

March 27, 1967

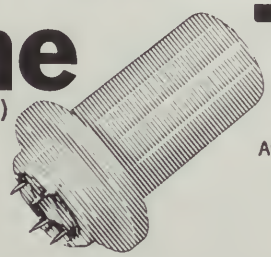
CERTIFICATE

GENTLEMEN:

We have made an audit of the records of the Treasurer of the Medical and Chirurgical Faculty of the State of Maryland for the year ended December 31, 1966. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures that we considered necessary in the circumstances.

In our opinion, the Exhibits, together with the comments in this report, present fairly the financial position of the Faculty as of December 31, 1966 and the results from operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

Respectfully submitted,
WOODEN, BENSON & WALTON



what time is it?

For the past
two years
there's been
one new case
of active tuberculosis
reported for every
four thousand
of U.S. population.

it's time to tine.

EQUANIL®
(meprobamate) Wyeth

Cautions: Carefully supervise dose and amounts prescribed, especially for patients prone to overdose themselves. Excessive prolonged use may result in dependence or habituation in susceptible persons—as ex-addicts, alcoholics, severe psychoneurotics. After prolonged high dosage, drug should be withdrawn gradually to avoid possibly severe withdrawal reactions including epileptiform seizures. Side effects include drowsiness and, rarely, allergic or idiosyncratic reactions. These reactions, sometimes severe, can develop in patients receiving only 1 to 4 doses who have had no previous contact with meprobamate. Mild reactions are characterized by urticarial or erythematous maculopapular rash. Acute non-thrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever have been reported. Meprobamate should be stopped and not reinstituted. Severe reactions, observed very rarely, include angioneurotic edema, bronchial spasms, fever, fainting spells, hypotensive crises (1 fatal case), anaphylaxis, stomatitis and proctitis (1 case) and hyperthermia. Warn patients of possible reduced alcohol tolerance. Should drowsiness, ataxia, or visual disturbances occur, dose should be reduced. If symptoms persist, patients should not operate vehicles or dangerous machinery. A few cases of leukopenia, usually transient, have been reported following prolonged dosage. Other blood dyscrasias—aplastic anemia (1 fatal case), thrombocytopenic purpura, agranulocytosis and hemolytic anemia—have occurred rarely, almost always in the presence of known toxic agents. One fatal case of bullous dermatitis following intermittent use of meprobamate with prednisolone has been reported. Prescribe very cautiously for patients with suicidal tendencies. Suicidal attempts should be treated with immediate gastric lavage and appropriate supportive therapy.

Contraindications: History of sensitivity to meprobamate.

Composition: Tablets, 200 mg. and 400 mg. meprobamate. Coated Tablets, WYSEALS® EQUANIL (meprobamate) 400 mg. Continuous-Release Capsules, EQUANIL L-A (meprobamate) 400 mg.

Wyeth Laboratories
Philadelphia, Pa.

Wyeth® SERVICE TO MEDICINE

IRON DEFICIENCY

ANEMIA

Imferon®
(iron dextran injection)

There's as much iron . . . 250 mg. . . . in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron . . . or orally administered iron proves ineffective or impractical . . . or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves. Precise dosage is easily calculated.

LAKESIDE

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion as a source of iron; infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylactoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

ALLEGANY COUNTY

The Allegany Medical Society, recently elected L. Michael Glick, MD, as president of the Society. The remaining officers elected were: Lester Kiefer, MD, vice-president; Robert T. Miller, MD, secretary; and Albert P. Marsh, MD, treasurer.

Dr. Glick, who is practicing Internal Medicine completed his medical training at the University of Maryland and did his internship and residency at the Mercy Hospital in Chicago. In addition, he had training at Mount Sinai, and the West Side VA hospital in Chicago, Ill. He is presently a Clinical Instructor in Internal Medicine at the West Virginia State University and is a member of AMA and the American Federation for Clinical Research.

L. Michael Glick, MD

BALTIMORE CITY

Nine of the members of the board of directors of the Baltimore City Medical Society were present on April 11, 1967, at the monthly meeting held at 1211 Cathedral Street, Baltimore, Md. Harry J. Connolly MD, president of the Baltimore City Medical Society presided. Colonel Scoles, from the Kimbrough Army Hospital, Ft. George G. Meade, entered a plea to the City Society for help in placement of discharged army personnel trained in paramedical skills. He pointed out that this huge manpower pool was not being utilized efficiently upon their return to civilian life. He reminded us that these people have much to offer the civilian community and would be of great help in alleviating the shortage now existing in almost every parameter of hospital personnel. After much discussion, the board of directors decided that this important problem should be referred to the Maryland Hospital Council, the State Employment Agency, and the Specialty Sections of the State Society.

A report concerning the Baltimore City Nursing Home facilities was entered by F. F. Furstenburg, MD, who reminded us of the deplorable conditions which continue to exist in many nursing homes. He suggested, and the board agreed, that the Baltimore City Medical Society should actively pursue a program aimed at the betterment of these conditions. Further, it was suggested that the State Health Department be made aware of the City Society's position relative to this matter.

The board of directors decided that the emergency coverage questionnaire should be mailed to the members of the society with the September mail. A letter was received from the Executive Director of SAMA expressing the gratitude of the association for the society's support. Correspondence from Governor Agnew acknowledging his receipt of the society's suggested reappointment of Herman Seidel, MD, to the commission on problems of the aging, was read. Attention was

The Maryland Academy of General Practice

THE EVOLUTION OF A NEW SPECIALTY

The medical profession today is involved in the evolution of another specialty. The last primary specialty was formally recognized some nineteen years ago and most of the specialties were born 25 to 50 years ago. The new specialty is that of family medicine.

In viewing the steps in the evolution of any specialty, the following are evident. Occasionally the order is not necessarily the same, and many times certain steps occur almost simultaneously. These steps are (1) definition of content, (2) development of graduate (internship and residency) training programs to train skills and techniques, (3) the development of specialty departments in medical schools to train students in attitudes which will qualify them for graduate training programs, (4) the establishment of standards, (5) development of examinations to insure that these standards are met, (6) the development of continuing or postgraduate education programs to insure that the standards are maintained, and (7) the generation of research programs to develop the body of knowledge peculiar to the specialty concerned.

The "Core Content of Family Medicine" has been defined and recently adopted by the Congress of Delegates of the American Academy of General Practice as being the blueprint for the family practitioner of the future. No such similar document existed previously for the broad area of practice known as general practice. This *Core Content* will serve as a guide for the training of family physicians at all levels.

New graduate training programs are being developed and the necessary changes in present requirements governing residencies in this area are in the process of being modified to permit more flexible, improved residency-training programs.

Recommendations have been published to assist medical schools in the formation of departments of family practice. These recommendations are concisely stated in an AAGP Commission on Education publication, *The Family Practice Department in the Medical School.* Some medical schools are now embarked on the formation of departments of family practice.

The Committee on Requirements for Certification, a joint AMA-AAGP group, is engaged in establishing standards for the new specialty of family practice and early ground work on the development of examinations to insure that these standards are met has begun. Since it is planned that there will be no automatic "grandfathering" of present general practitioners into the speciality of family practice, training programs and examinations must be coordinated to assist the present general practitioners into the specialty of family general practitioners to become true specialists in family practice.

The coordination of continuing or postgraduate education courses to maintain the standards of family medicine which will be established, and to train present general practitioners in some of the newer concepts of the family practitioner of the future, is a major step ahead. One of the proposed principles applying to the new specialty is that of periodic "re-boarding" of members of the new specialty.

Stated simply, this would mean re-qualification

after a given period of time in the specialty in order to prove continued competence. To assist family physicians to maintain skills and techniques in all the areas of the new specialty as defined by the *Core Content,* a coordinated system of continuing education covering all the areas in family medicine will be developed and this, together with the experiences in practicing family medicine, will qualify the new specialist for "reboarding."

It is quite likely that the greatest contribution which the new specialty of family medicine will make to the medical world will be in the development of improved methods of the delivery of medical care. Basic and applied research in the area of the delivery of medical care will probably become the primary responsibility of this new specialty and in the course of this research the specialty of family practice will develop its own body of knowledge. Medical schools and practicing family physicians will participate in research programs.

As may be seen, the specialty of family practice is well started in its evolutionary process. Many of the steps listed above will occur at approximately the same time and progress is now being made in all of these listed steps.

However, the acceptance of the concept of such a family practice department, through which the group of practicing family practitioners can have an adequate voice in medical school affairs, may be slow. In the initial stages, the establishment of a department of family practice may be possible in but a few select institutions, and these departments will undoubtedly be observed with great interest.

The Academy of General Practice, we feel, should make no attempt in the establishment of the family practice department to specify curriculum changes other than those affecting the family practice department itself and necessary to produce the individual defineable in the core content of family medicine. The family practice department must *prove itself,* and its success must at all times be a matter of concern of the entire medical school.

With the advent of all the federal health plans it will be necessary to have a new approach for patient material for students. Patient material for teaching in the family practice or comprehensive medical department will have to be derived from the large community of patients now utilizing university hospitals as their primary source of medical care. In certain areas it may be necessary, however, for the private practitioners to relinquish some patients to the medical school in order to afford adequate teaching patients. With the increasing load upon the medical practitioners in most areas, it seems unlikely that this will cause any objections by, or financial loss to, the physicians in private practice. This teaching program in family practice is not intended to divert patients referred by their personal physician to the university medical center for specialized care.

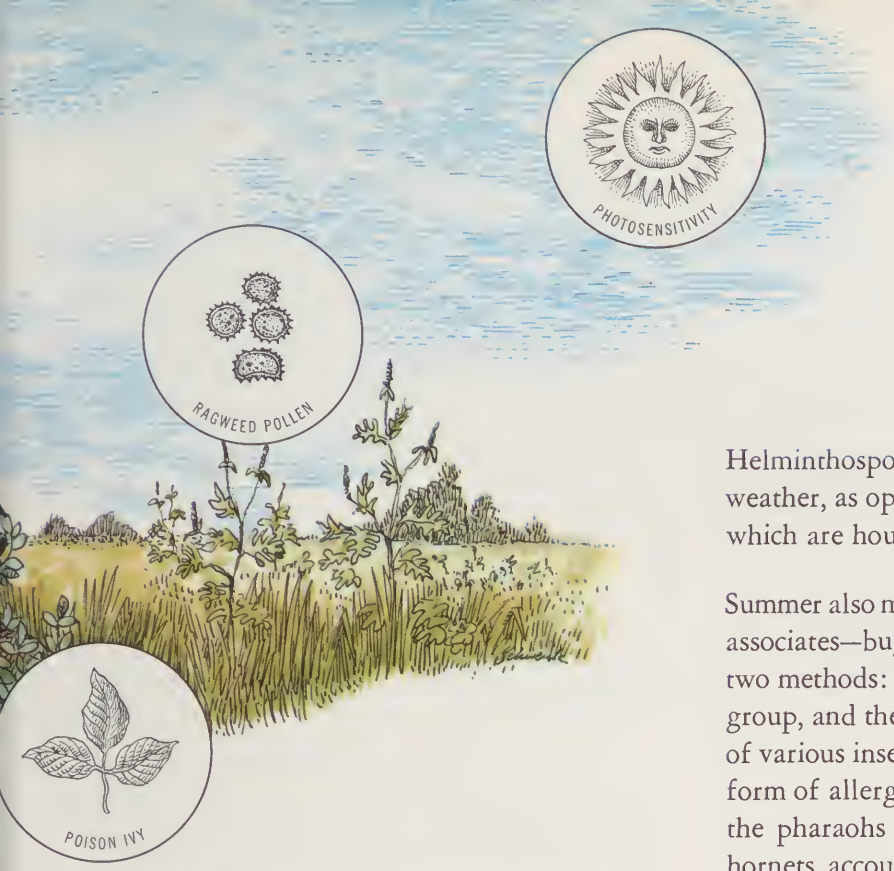
DORSEY Season

A journal within a journal published quarterly in the interests of better medicine by Dorsey Laboratories, a division of The Wander Company, Lincoln, Nebraska. Address communications to Raymond C. Pogge, M.D., Director of Medicine.

this issue: the ubiquitous world of summer allergies

the ubiquitous world of summer allergies

Donald L. Unger, M.D. • Clinical Assistant Professor, Department of Medicine (Allergy), Stritch School of Medicine (Loyola).



In the Spring a young man's fancy lightly turns to thoughts of—allergies. This is at least true of the 10% of the population who have hay fever and the 4% who have asthma.[1] The snow melts, the trees blossom and the noses run. Patients who were fine all winter may not be enthralled by the sight of the first robin or the blossoming of a crocus, for their appearances may precede the "sneezin' season."

Allergies in general can be divided into winter allergies and summer allergies. In the winter the main problems are inside the house: e.g. dogs, cats, dust and feathers. Houses in the northern half of the country become so dry that it becomes essential to add humidity to the home; this is a far cry from the damp summer months with the moldy basements and need for dehumidifiers.

Early in April trees begin to pollinate, with each tree having about a two week period of pollination. A particular patient may be sensitive to only one tree and thus have his hay fever for such a short time that he thinks he has a cold.[2] The entire tree season starts about April 1 and ends about Memorial Day, although all hay fever seasons are blurred and prolonged in the southern part of the country. Tree pollen is usually very heavy and a person may well have most of his exposure from those trees immediately surrounding his home.

Grasses pollinate from about May 15 until July 4, and cause "rose fever." Grass pollens are somewhat lighter and more buoyant than tree pollens, and are much more ubiquitous. While there are several varieties of grasses in the United States, they are so closely related antigenically that a person sensitive to one is generally sensitive to them all.[3] Thus, while the tree season is really several small seasons intertwined, the grass season will usually result in symptoms for a more prolonged period. Obviously, a grass-sensitive patient will have trouble only when grass is pollinating—he will have to think of another excuse not to mow the lawn after July 4.

Ragweed is the "Big Daddy" of them all in the eastern two-thirds of the country. Pollination is generally from mid-August until the end of September, with the predicted lower counts and longer seasons

in the southern part of the country. Ragweed is a very light pollen which may be windborne for hundreds of miles. An interesting study was made in New York City, in which 90% or more of the ragweed plants were destroyed in three of the five boroughs; pollen counts done during the season were virtually identical in all five.[4]

Ragweed is, of course, the most common cause of hay fever and is associated with an incredible loss of man hours from work each year. Many is the patient who travels to areas where the pollen count is low, just to avoid having symptoms. There is no ragweed anywhere in the world except the United States and portions of Canada and Mexico.

While molds are present through the year, the most important ones predominate from April until November. An old wives' tale has ragweed ending with the first frost, when actually it ends a good month earlier. It is Alternaria—the kingpin of the molds—that meets a sudden demise with the first frost. Alternaria-sensitive patients are in their glory when there is snow on the ground, and might be ideally suited to man the radar stations in Alaska. In September and October, Alternaria counts are at their highest, perhaps associated with the burning of leaves. Other molds such as Hormodendrum and Helminthosporium are associated with the warmer weather, as opposed to Penicillium and Aspergillus which are household molds.

Summer also means the return of our much maligned associates—bugs. Insects cause allergic symptoms by two methods: the bite or sting of the Hymenoptera group, and the inhalation of particles of the bodies of various insects. Wasp stings are the oldest known form of allergy, as they caused the death of one of the pharaohs in ancient Egypt.[5] Bees, wasps and hornets account for many deaths in this country, and those sensitive to them should carry special treatment kits at all times; a few minutes delay in the administration of epinephrine to such a patient, might be the difference between life and death. Inhalation of particles of insects may cause sneezing and wheezing in a susceptible individual.[6] Both of these forms of insect allergy may be benefitted by hyposensitization.

The insect recognizes no professional bounds. He is as apt to bite the physician as the patient. So this season, beware of bugs. And beware, too, of poison ivy. That pleasant stroll through the woods and underbrush with the Boy Scouts might turn into a

nightmare for the botanically uninitiated in the causes of rhus dermatitis (poison ivy, poison oak and poison sumac). Although you may have been careful, your dog may not have noted that it wasn't clover he jumped through, but poison ivy. His return to your side may give you the rhus dermatitis that you so carefully avoided. That heavenly campfire may be emitting particles of rhus oil to produce an airborne contact dermatitis of the exposed areas of the body.

Another fascinating, but rather infrequent type of summer allergy is physical allergy. Some people sneeze on exposure to sunlight, while others break out in rashes, usually on the exposed parts of the body. These rashes may well follow the administration of various photosensitizing drugs, e.g. demethylchlortetracycline.[7] Another form of physical allergy and one that may be lethal in the summer, is cold allergy. Yes, I mean cold allergy, not heat allergy. The cool dip on a hot day with its consequent sudden chilling of the body, may be the coup de grace for a cold sensitive patient.[8] It is customary to write "heart attack" on the death certificate, even though the victim may have been an 18-year-old boy who looks like a Greek god.

Lest the reader be depressed by this saga of afflictions associated with the warmer months, perhaps he should remember that it is also a time for swimming, baseball, lying in the sun and taking that long-planned vacation. So let's all join in a chorus of "In the Good Old Summertime," as we sneeze, wheeze and scratch. Be careful of your suntan lotion, however; it may cause you a contact dermatitis.

How can he be a sport with a runny nose?

For summer allergies, summer colds, or nasal congestion due to almost any cause, you prescribe quick r-e-l-i-e-f with Triaminic. It's ideal for summer allergies:

1. Acts in 15-30 minutes due to decongestant.
2. Follows up with balanced dual antihistamines.
3. Up to 24-hour 'round the clock relief when dosed one tablet at morning, mid-afternoon and evening.

Summer time is sport time and who can be a sport with a runny nose?

provide patient comfort

Triaminic® relieves summer allergies

Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitation, flushing, dizziness, nervousness or gastrointestinal upsets.

Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

Transient Ischemic Attacks of the Brain: Part 1—Diagnosis

ERLAND NELSON, MD, PHD
Professor and Head, Department of Neurology
University of Maryland School of Medicine

Transient ischemic attacks (TIAs) of the brain are, paradoxically, not only the most misdiagnosed and neglected of the varieties of cerebrovascular disease, but are also the most amenable to therapy. While there may be frequent recurrent attacks which never progress to a completed stroke, it is clear that in many instances, the TIA presages a cerebrovascular catastrophe. The term *transient ischemic attack* is appropriate, for the symptoms are not long-lasting but are usually present from only a few minutes up to an hour; they are due to cerebral ischemia and are to be distinguished from the hemorrhagic types of cerebrovascular disease; and they are "attacks," swift in onset, and do not produce a gradually developing deficit.

The diagnosis of TIAs is made almost exclusively by history. While an evanescent toe sign or nystagmus at the time of the examination may further corroborate the significance of the patient's history, the majority of the patients with TIAs have a normal neurological examination. This fact has, no doubt, led both patient and physician to dismiss the symptoms of transient cerebral ischemia as being either psychogenic or of no consequence. Because of present rational therapeutic measures, such attitudes are no longer appropriate.

Fundamental to the diagnosis of transient cerebral ischemia is an awareness of certain anatomical features of the vascular and neurological systems. Thus, there is a therapeutically significant separation of the blood supply of the brain into *extracranial* and *intracranial* circulation. The intracranial cerebral vessels are further divided functionally into an *anterior* circulation derived from the internal carotid arteries and a posterior circulation flowing up from the vertebral-basilar system. Further, there is the possibility for collateral blood flow at the circle of Willis or over the brain surface as well as from external to internal carotid territory by several routes. The symptoms of which the patient complains are, in the last analysis, the result of ischemia in a certain portion of the *brain*. The condition of the supplying vessels, and the degree of collateral flow available are important variables that may determine not only whether symtoms will occur, but if the transient symptoms will become permanent deficits. Two symptoms, monocular visual loss and aphasia are pathognomic of anterior circulation insufficiency. Characteristic of posterior insufficiency are vertigo, incoordination, diplopia, dysarthria or "drop attacks." Insufficiency of either anterior or posterior systems may produce unilateral sensory or motor deficits, or homony-

mous field cuts. A shifting hemiparesis, hemihypesthesia, or hemianopsia favors insufficiency in the vertebral-basilar system. This distinction has prognostic and therapeutic importance.

Certain features in the general physical examination may provide clues giving further weight to a history compatible with TIAs, eg, production of symptoms with head turning; neck or supraclavicular murmurs; auricular fibrillation; or a 20-point systolic variation in pressure and pulse lag in the two arms, indicating a "subclavian steal syndrome." In other instances appropriate laboratory studies reveal the presence of either polycythemia or anemia, myocardial infarction or cervical spondylosis. Consideration must be given to those conditions which may mimic TIAs and further questioning and appropriate tests may need to be done to rule out epilepsy, migraine, Meniere's syndrome and conversion reactions. In the next issue of *The Journal*, THE HEART PAGE will be devoted to a discussion of management of patients with transient ischemic attacks.

A Stroke Program Office has been established under the aegis of the Maryland Heart Association for a pilot study to register Stroke Cases in the community. This Registry will provide invaluable information on the several varieties of cerebrovascular disease, including natural history, results of therapy and influence of a number of environmental and hereditary factors. The full cooperation of Maryland physicians is earnestly requested. Further information concerning this program will be mailed directly to physicians by the Maryland Heart Association.—ED.

LOOK TO THE ULTIMATE IN NURSING HOMES

What makes Community Health Facilities *different and better* than other nursing homes in Maryland? The main reason they stand out from all the other homes is that these nine health institutions are made up of skilled people whose entire lives are devoted to the profession of helping others. These people are interested, concerned and thoroughly conscientious regarding every guest they have. At a Community Health Facility, each and every guest receives personalized individual care that guarantees them a pleasant stay whether they are convalescing or receiving restorative long term rehabilitative care.

COMMUNITY HEALTH FACILITIES FEATURE:

- Registered Nurses—24 hour nursing care
- Open medical staff—your doctor continues to care for you
- Special diets under the supervision of an Accredited Dietician
- Modern hospital equipment—Oxygen, Intravenous, Suction Therapy
- Physical Therapy Available
- Air Conditioning Available
- Religious Services
- Recreational Areas
- Separate Units provide separation of convalescent from sicker patient
- True convalescent section—Intensive Care Unit
- And *best of all . . . attractive and sensible rates*

DEPRESSION

NORPRAMIN®
(desipramine hydrochloride)

ANTIDEPRESSANT FOR RAPID IMPROVEMENT

At the recommended dosage level —initially, 150 mg. per day— gratifying remission of the signs and symptoms of depression typically begins in 2-5 days. Its specificity for depression, rapidity of action and usually mild side effects are significant reasons for prescribing NORPRAMIN (desipramine hydrochloride) in depression of any type . . . any degree of severity.

A few patients, sensitive to central nervous system stimulants may become restless as depression is lifted—in such cases dosage may be reduced or a tranquilizer added.

LAKESIDE

IN BRIEF:

INDICATIONS: In depression of any kind —neurotic and psychotic depressive reactions; manic-depressive or involutional psychotic reactions.

CONTRAINDICATIONS: Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease, epilepsy. Should not be given within two weeks of treatment with a monoamine oxidase inhibitor.

RELATIVE CONTRAINDICATIONS: (1) Patients with a history of paroxysmal tachycardia. (2) Patients receiving concomitant therapy with thyroid, anticholinergics or sympathomimetics may experience potentiation of effects of these drugs. (3) Safety in pregnancy has not been established.

PRECAUTIONS: (1) Outpatient use of desipramine hydrochloride should not be substituted for hospitalization when risk of suicide or homicide is considered grave. (2) If serious adverse effects occur, reduce dosage or alter treatment. (3) In patients with manic-depressive illness a hypomanic state may be induced. (4) Discontinue drug as soon as possible prior to elective surgery.

ADVERSE EFFECTS: Side effects, usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste," sensory illusion, tinnitus, anxiety, agitation and stimulation, insomnia, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, tremor, allergy, agranulocytosis, altered liver function, ataxia, and extrapyramidal signs.

DOSAGE: Optimal results are obtained at a dosage of 50 mg., t.i.d. (150 mg./day). **SUPPLIED:** NORPRAMIN (desipramine hydrochloride) tablets of 25 mg.; bottles of 50, 500 and 1000; and tablets of 50 mg., in bottles of 30, 250 and 1000.

VALIUM®
(diazepam) Roche®

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Infants, patients with history of convulsive disorders, glaucoma or known hypersensitivity to drug.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly or debilitated patients (not more than 1 mg, one or two times daily initially) to preclude ataxia or oversedation, increasing gradually as needed or tolerated. As is true of all CNS-acting drugs, until correct maintenance dosage is established, advise patients against possibly hazardous procedures requiring complete mental alertness or physical coordination. Driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. If such combination therapy is used, carefully consider individual pharmacologic effects—particularly with known compounds which may potentiate action of Valium (diazepam), such as phenothiazines, barbiturates, MAO inhibitors and other antidepressants. Advise patients against simultaneous ingestion of alcohol or other CNS depressants. Safe use in pregnancy not established. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Observe usual precautions in impaired renal or hepatic function. Periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances, acute hyperexcited states, hallucinations); changes in EEG patterns during and after drug treatment. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms (convulsions, tremor, abdominal and muscle cramps, vomiting, sweating) similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage—*Adults:* Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. *Geriatric patients:* 1 or 2 mg/day initially, increase gradually as needed and tolerated. (See Precautions)

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 and 500.
